Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Manage your practice in ten-part HARMONY.®

1 **Comprehensive Solutions:** MTI's HARMONY integrates every business office function...data and word processing, claims submission, patient records, appointments scheduling, accounts management...into a comprehensive, turn-key practice management system.

2 **Customized Solutions:** Hardware, software, installation, training, AFTERCARE support, supplies...all custom-tailored to your individual practice.

3 **Unlimited Training:** For your current *and* future staff, for the life of your system.

4 **Over 1000 Doctors:** MTI's systems are meeting the practice management needs of hundreds of physicians...in every specialty, all across the country.

5 **Compatibility:** We offer a free evaluation of your system and practice and help you determine lowest-cost options for upgrades...and MTI's systems are compatible with IBM, Wang, DEC, and most other major manufacturers.

6 **Conversion:** MTI specialists will transfer all practice data on your current system to the HARMONY system. No downtime, no overtime, no anxiety.

7 **Aftercare:** A phone call away, MTI technicians keep your system up and running...with vigilant support, extended service hours, guaranteed response time and repairs, software updates, and custom-programming options.

8 **Money-Back Guarantee:** Something rare among practice management vendors...a money-back guarantee! If HARMONY doesn't meet performance specifications, we'll refund your money.

9 **Non-Obsolescence Guarantee:** Every component offered by MTI is state-of-the-art and will stay that way... supplemented by ongoing system research, programming and enhancements offered to all clients on software maintenance.

10 **Price:** Best of all, HARMONY is competitively-priced *and* cost-effective. Call MTI at 800-777-7MTI.

CONSENT FORMS FOR INFLUENZA AND PNEUMOCOCCAL VACCINE

Physicians have to provide adequate information to patients prior to administration of influenza and pneumococcal vaccines. The consent forms used in public health clinics may be useful in ensuring all pertinent facts are told to the patient prior to the administration of the vaccines.

IMPORTANT INFORMATION ABOUT PNEUMOCOCCAL DISEASE AND PNEUMOCOCCAL POLYSACCHARIDE VACCINE

Please read this carefully

PNEUMOCOCCAL
3/1/86

WHAT IS PNEUMOCOCCAL DISEASE? *Streptococcus pneumoniae* is a bacterium that causes much illness and death in the United States each year. This bacterium, also called the Pneumococcus, can cause serious infections of the lungs (pneumonia), the bloodstream (bacteremia), and the covering of the brain (meningitis). About 5 persons out of every 100 who get pneumococcal pneumonia, about 20 out of every 100 who get bacteremia, and about 30 out of every 100 who get meningitis die of these infections. Anyone can get pneumococcal disease; however, persons over 65 years of age and persons of any age who have special types of health problems have the greatest risk.

People are more likely to die from pneumococcal disease if they have problems such as alcoholism, heart or lung disease, kidney failure, diabetes, or certain types of cancer. Older persons as a group are also more likely to die from pneumococcal disease. Forty out of every 100 persons who have these special health problems die when they develop pneumococcal bacteremia and 55 out of 100 with these special health problems die if they get pneumococcal meningitis. The high risk of death occurs in spite of treatment with drugs like penicillin. Because of the risk of serious complications from pneumococcal infection, vaccination is recommended for older persons and for children and adults with special health problems.

PNEUMOCOCCAL POLYSACCHARIDE VACCINE:
The pneumococcal polysaccharide vaccine contains material from the 23 types of pneumococcal bacteria that cause 87 percent of pneumococcal bacteremias. Most healthy adults who receive the vaccine develop protection against most or all of these types of pneumococcus bacteria 2-3 weeks after vaccination. Older persons and those with some long-term illnesses may not respond as well or at all. Children under 2 years of age are also not protected by the vaccine. How long the protection lasts is not known at this time; however, the vaccine should be given only once. The vaccine is given by injection.

WHO SHOULD RECEIVE PNEUMOCOCCAL POLYSACCHARIDE VACCINE?
Vaccination is recommended for the following:

Adults

1. Adults with long-term illnesses—especially those involving the heart or lungs.

2. Adults with long-term health problems that are associated with a high risk of getting serious pneumococcal infections. These include adults who have alcoholism, diabetes, kidney failure, abnormal function or removal of the spleen, Hodgkin's disease, multiple myeloma, cirrhosis, leaks of cerebrospinal fluid (CSF, the fluid surrounding the brain and spinal cord), or who have diseases that lower the body's resistance to infections or are taking drugs that lower the body's resistance to infections.

(PLEASE READ OTHER SIDE)

3. Older adults, especially those 65 years of age and older, who are otherwise healthy.

Children
Children 2 years of age and older with long-term illnesses that are associated with a high risk of getting serious pneumococcal infections. This includes children whose spleens have been surgically removed, as well as those who have sickle cell disease, nephrotic syndrome (a type of kidney disease), or CSF leaks, or who have diseases that lower the body's resistance to infections or are taking drugs that lower the body's resistance to infections.

Note
Frequent diseases of the upper respiratory system, including infections of the ear or sinuses, in children who are otherwise healthy, are *not* reasons to use this vaccine.

General Considerations
Although this vaccine may not be as effective in some persons, especially those who do not have normal resistance to infections, vaccination is still recommended for such persons because they are at high risk of developing severe disease.

POSSIBLE SIDE EFFECTS FROM THE VACCINE:
About half of those who are given pneumococcal vaccine have very mild side effects, such as redness and pain at the injection site. Less than 1 percent of those given pneumococcal vaccine may develop fever, muscle aches, and severe local reactions. Serious side effects, such as severe allergic reactions, have rarely been reported—about 5 in every million doses given. As with any drug or vaccine, there is a rare possibility that allergic or more serious reactions or even death could occur.

REVACCINATION: Pneumococcal vaccine should be given *only once* to adults; no "booster" dose is recommended. It is not yet known whether children need to be revaccinated. Allergic reactions have occurred among persons given second doses and are thought to be caused by existing immunity from the first dose. Persons who received the older pneumococcal vaccine that included only 14 types of pneumococcal bacteria do not need to receive this new vaccine since the slight increase in effectiveness does not outweigh the increased risk of reactions. Complete records of vaccination should be kept to avoid giving the vaccine more than once.

PREGNANCY: The safety of pneumococcal vaccine for pregnant women has not been studied. It should not be given to healthy pregnant women. Women who are at high risk of pneumococcal disease and who are candidates for pneumococcal vaccine ideally should be vaccinated before pregnancy.

QUESTIONS: If you have any questions about pneumococcal disease or pneumococcal polysaccharide vaccine, please ask now or call your doctor or health department before you sign this form.

REACTIONS: If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic during the 4 weeks after receiving the vaccine, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

I have read the information on this form about pneumococcal disease and pneumococcal polysaccharide vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the pneumococcal vaccine and request that it be given to me or to the person named below for whom I am authorized to make this request.

Certain medical staff who provide care to high-risk patients in health-care facilities should be vaccinated, to reduce the possibility that these patients might catch the flu when receiving medical care: Family members or others who provide care to high-risk persons at home should also be vaccinated. The possibility for spreading the flu to high-risk persons can be reduced by vaccinating:

- Doctors, nurses, and others who have extensive contact with high-risk patients, such as specialists and staff of intensive care units.
- Individuals who provide care to high-risk persons at home, such as visiting nurses and volunteers, as well as all household members, including children, whether or not they are providers of care.

In addition, a flu shot should be given to anyone who wishes to reduce his/her chances of catching the flu.

INFLUENZA VACCINE: The viruses that cause flu frequently change, so people who have been infected or given a flu shot in previous years may become infected with a new strain. Because of this, and because any immunity produced by the flu shot will possibly decrease in the year after vaccination, persons in the high-risk groups listed above should be vaccinated every year. This year's flu shot contains the strains A/Taiwan/1/86, A/Sichuan/2/87, and B/Victoria/2/87 to provide immunity against the types of flu which have been circulating in the past year and are thought to be most likely to occur in the United States next winter. All the viruses in the vaccine are killed so that they cannot infect anyone. Vaccine will begin to provide its protective effect after about one or two weeks, and immunity may decrease, on average, after several months. Flu shots will not protect all persons who get them against the flu. They also will not protect against other illnesses that resemble the flu.

DOSAGE: Only a single flu shot is needed each season for persons older than 12 years, but children 12 years or less may need a second shot after about a month. The doctor or nurse giving the flu shot will discuss this with parents or guardians. Children should be given only vaccine that has been chemically treated during manufacture ("split virus") to reduce chances of any side effects. Split-virus vaccine can also be used by adults.

POSSIBLE SIDE EFFECTS FROM THE VACCINE: Most people have no side effects from recent influenza vaccines. Flu shots are given by injection, usually into a muscle of the upper arm. This may cause soreness for a day or two at the injection site and occasionally may also cause a fever or achiness for one or two days. Unlike 1976 swine flu vaccine, recent flu shots have not been linked to the paralytic illness Guillain Barre Syndrome. As is the case with most drugs or vaccines, there is a possibility that allergic or more serious reactions, or even death, could occur with the flu shot.

WARNING-SOME PEOPLE SHOULD CHECK WITH A DOCTOR BEFORE TAKING INFLUENZA VACCINE:

- Persons who should not be given the flu shot include those with an allergy to eggs that causes dangerous reactions if they eat eggs.
- Anyone who has ever been paralyzed with Guillain Barre Syndrome, as well as women who might be or are pregnant, should seek advice from their doctor about special risks that might exist in their cases.
- Persons who are ill and have a fever should delay vaccination until the fever and other temporary symptoms have gone.

QUESTIONS: If you have any questions about influenza or influenza vaccination, please ask now or call your doctor before requesting the vaccine.

REACTIONS: If any receiving influenza vaccine gets sick and visits a doctor, hospital or clinic in the 4-weeks after vaccination, please report this to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

IMPORTANT INFORMATION ABOUT INFLUENZA AND INFLUENZA VACCINE, 1988 - 1989

PLEASE READ THIS CAREFULLY

WHAT IS INFLUENZA ("FLU")? Influenza (or "flu") is a viral infection of the nose, throat, bronchial tubes, and lungs that can make someone of any age ill. Usually the flu occurs in the United States from about November to April. If you get the flu, you usually have fever, chills, cough, and soreness and aching in your back, arms, and legs. Although most people are ill for only a few days, some persons have a much more serious illness and may need to go to the hospital. On average, thousands of people die each year in the United States from the flu or related complications.

WHO SHOULD GET INFLUENZA VACCINE? Because influenza is usually mild and most people recover fully, health officials emphasize the use of vaccine for the elderly and people with other health problems most likely to be seriously ill or to die from the flu or its complications. For example, people who after even light exercise become short of breath due to diseases affecting their heart or lungs, and people who have low resistance to infections, are likely to be more seriously affected by the flu. Thus, the following groups are at highest risk for serious illness with the flu and have been particularly recommended to receive vaccine:

- Adults and children with long-term heart or lung problems which caused them to see a doctor regularly, or to be admitted to a hospital for care during the past year.
- Residents of nursing homes, and other institutions housing patients of any age who have serious long-term health problems.

Other groups who are at moderately increased risk for serious illness with the flu and who public health authorities feel should be vaccinated if possible are:

- Healthy people over 65 years of age.
- People of any age who during the past year have regularly seen a doctor or have been admitted to a hospital for treatment for kidney disease, cystic fibrosis, diabetes, anemia ("low blood"), or severe asthma.
- People who have a type of cancer or immunological disorder (or use certain types of medicines) that lowers the body's normal resistance to infections.
- Children and teenagers (6 months through 18 years of age) on long-term treatment with aspirin who, if they catch the flu, may be at risk of getting Reye syndrome (a childhood disease that causes coma, liver damage, and death).

(PLEASE READ OTHER SIDE)

Join the MEDICAL and CHIRURGICAL FACULTY of the STATE OF MARYLAND On an Exciting and Exclusive New 1989 Deluxe Travel Adventure

Let us take the trouble out of travel for you. Look over these eight extraordinary choices for 1989; then make your reservations immediately. We don't want to leave without you.

French Normandy Coast/ Seine River Cruise

Departing: May 1989

An exclusive, new and different thirteen-day adventure. **London**, England. Exclusive, chartered cruise of the **Normandy Coast** and the **Seine River** aboard the ***M.S. World Discoverer*** from **Dover** past the White Cliffs to **Portsmouth**. Cross the English Channel to **St.-Malo/Mont-St.-Michel; Jersey**, English Channel Islands; **Caen; Normandy D-Day Beaches; Honfleur; Caudebec-en-Caux** and **Rouen**. Visit **Giverny** en route to **Paris**, France.

From $2999 per person, double occupancy, from New York

The Wind Spirit • Italy/Adriatic Air/Sea Cruise

Departing: July 1989

An exciting, new thirteen-day combination of the sailing yacht *Wind Spirit* and the best of Italy. **Florence** and **Venice**, Italy. Cruise aboard the *Wind Spirit* among the islands of the Dalmatian Coast: **Losinj, Split, Hvar, Korcula, Kotor Fjord/ Sveti Stefan** and **Dubrovnik**, Yugoslavia.

From $3899 per person, double occupancy, from New York

Danube River

Departing: July 1989

First, two nights in **Istanbul**, Turkey, city of mosques and minarets. Then cruise the **Black Sea** aboard the ***M.S. Ayvazovskiy***. Transfer to the ***M.S. Ukraina*** for a **Danube River** cruise to **Giurgiu/Bucharest**, Romania; **Nikopol/Pleven**, Bulgaria; **Belgrade**, Yugoslavia; **Budapest**, Hungary; **Bratislava**, Czechoslovakia and **Vienna**, Austria. Both ships are **exclusively chartered**.

From $2999 per person, double occupancy, from New York

Canadian Rockies Adventure

Departing: August 1989

This ten-day nature spectacular includes **Edmonton, Jasper Park**, a visit to **Lake Louise, Banff, Victoria** and **Vancouver**.

$1899, per person, double occupancy plus airfare

Orient-Express

Departing: August 1989

The nostalgic and romantic ***Venice Simplon Orient-Express*** is the magnificent centerpiece of this exclusive thirteen-day holiday to the best of Europe. **Munich**, West Germany. **Vienna**, Austria. Overnight on the ***Venice Simplon Orient-Express*** from Vienna to **Paris**, France.

$3599 per person, double occupancy from New York

Wings Over the Nile

Departing: October 1989

An exciting new fourteen-day holiday in Egypt. **Cairo. Alexandria.** Fly over **Suez Canal. St. Catherine's Monastery. Sharm el Sheikh. Four-day Nile River cruise** aboard your Sheraton-managed river boat, from **Luxor** to **Edfu, Kom Ombo** and **Aswan. Abu Simbel. All sightseeing during the cruise included**.

$3399 per person, double occupancy, from New York

MED-CHI AGENCY

Your Concern About Liability Insurance Is Our Concern.

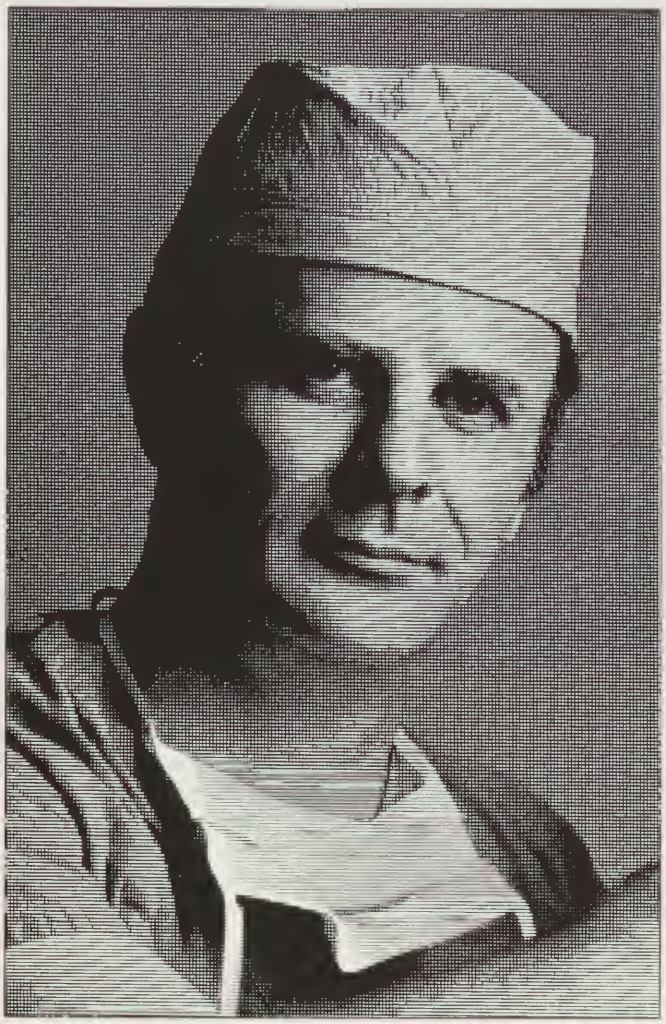
PreCare

Barry Holniker for Sinai Hospital

One of the latest volunteer efforts among Maryland physicians is "PreCare" (Physician Referral for Elder Care), a statewide telephone referral service designed to provide Medicare enrollees with names of physicians who accept Medicare assignment. PreCare is sponsored by Med Chi, the Component Medical Societies, and the Maryland Office on Aging. Governor Schaefer has endorsed the program saying that it "actively demonstrates the willingness and capability of the private and public sectors joining together to help our Maryland citizens."

PreCare was developed in an effort to provide every senior citizen in Maryland with access to affordable, quality health care. Governor Schaefer applauded this endeavor stating, "This kind of cooperative spirit is exactly what leadership is all about: concern for our citizens and the 'get it done' attitude."

PreCare operates through a network of local telephone numbers for each county and an 800 number at Med Chi, and it will be available to any person eligible for Medicare in Maryland regardless of income, financial assets, or medical condition. PreCare works in conjunction with "Gateway," a county based information network established by the Maryland Office on Aging. Gateway representatives currently provide information on services available to seniors as well as names of physicians who accept Medicare assignment. Med Chi has issued PreCare county referral numbers to each Gateway office in addition to promoting the new service to the media, county hospitals, senior centers, and participating physicians' offices.



Medicare enrollees using PreCare will discover that this program is readily accessible and very simple to use. Any senior in Maryland who requires a physician accepting Medicare assignment simply calls a local PreCare or Gateway number. A PreCare representative will provide the senior with one or more physicians in his or her area who accept Medicare assignment. The senior arranges an appointment with the physician of his/her own choice who will provide care on an assignment basis. Seniors who reside in counties without a local telephone referral number or those experiencing any problems with the program are encouraged to call Med Chi at 1-800-492-1056.

Governor Schaefer has expressed his congratulations to the "thousands of Maryland physicians who are participating in this program and who continue to uphold the highest traditions of our valued and caring profession of medicine in Maryland." Med Chi members and those participating in the PreCare program can be proud of the excellent service their joint effort is bringing to Maryland's senior citizens.

PRECARE

Physician Referral for Elder Care

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

ARMY MEDICINE. BE ALL YOU CAN BE.

Community Health and Holiday Sharing Programs

For the past two years (1986-1987) the Allegany County Auxiliary Community Health Program has been concerned with the needs of the children and the elderly of our community. We raised more than $1,000 to entertain with a Christmas party for 26 underprivileged and abused children. In this joyful project, Santa Claus (Dr. Francisco Reyes) and children of the Auxiliary presented the children with toys, clothes, and books.

We donated toys to the local Christmas project, "Toys for Happiness," which collects toys for needy children. This past year the Red Cross was the recipient of children's clothing collected from local stores by Auxilians.

On Christmas Day we visited four nursing homes and took fruit baskets along with providing entertainment.

A videotape on Teenage Pregnancy was donated to the Board of Education.

In another successful combination of efforts, the Allegany County Medical Society and the Medical Auxiliary celebrated the Cumberland Bicentennial with a Health Fair. Forty members were involved in this project, and eighteen health-realted organizations participated, including the three hospitals of the area, the Red Cross, the Health Department, the Cancer Society, and the Heart Association. The Medical Society and the Auxiliary had a booth with a display of the history of our organizations.

Combined with the Board of Education, every school in the county displayed posters on teenagers' problems: suicide, alcohol, drug abuse, teen pregnancy, drinking and driving, and child abuse.

The Fair, located in downtown Cumberland, was visited by numerous people.

ADELA REYES
President
Allegany County Medical Auxiliary

The Holiday Sharing Program, in operation in Anne Arundel County since 1980, matches donors with needy families at Thanksgiving and Christmas. Fifteen members of the Auxiliary work at the Department of Social Serivces (DSS) in Annapolis putting in 500 hours of service between August and December 24.

The DSS provides the Auxiliary with a large room, telephone, paper and printing, and a computer printout of all AFDC families in Anne Arundel County. These families consist mainly of single mothers who are receiving funds from DSS and have little or no extra for the holidays. The computer printout records all families helped and by whom. To clear names, we work very closely with other helping agencies, for example, the Salvation Army, the St. Vincent de Paul Society, and other service organizations. This helps us avoid duplication of effort and allows for more fair distribution of donations.

Our donors are businesses, churches, government agencies, individuals, organizations, and schools. Most of our donors provide food, clothing, and toys, and take care of all the shopping and delivering of these items to the recipients.

There are many highlights to our program each year. Congressman Tom McMillan holds an annual party and asks all guests to bring a new wrapped toy, which is donated to Holiday Sharing. Several high schools have canned food drives, which result in hundreds of cans of food being donated to the emergency food pantries in our county. Staff at our two county hospitals have become very involved in our project and sponsor many families.

A great deal of positive publicity is generated by this project. As many as fifteen related articles appear each year in our two local newspapers, and each time the Auxiliary is mentioned as being the moving force behind the project.

The Holiday Sharing Program has grown over the years. Last year we coordinated help to almost 2,500 families. In 1987 we received almost $6,000, and these donations were used for gifts for foster children and many senior citizens. We anticipate that the 1988 season will prove to have been equally successful.

IMELDA C. HERZINGER, Chairman
Holiday Sharing Project
Anne Arundel County Auxiliary

Auxililary to the Medical and Chirurgical Faculty of the State of Maryland. Mrs. Eva Edmonds, President; Mrs. Betty J. Molz, Editor.

Executive Director's Newsletter

January 1989

PHYSICIAN PAYMENT REVIEW COMMISSION SURVEY

The Physician Payment Review Commission is conducting a survey to obtain data on practice costs, Medicare assignment patterns, the use of certain diagnostic services, and the allocation of physicians' time. Results of the survey will be used to develop recommendations on Medicare reimbursement and other issues, and will be included in the Commission's March 1989 report to Congress. The survey will enable physicians to have direct input into the process of reforming the Medicare program. A random sample of approximately 6,000 physicians will be selected to participate in this study to be conducted by Westat, Inc. Confidentiality of respondents will be strictly protected.

MEDICARE REIMBURSEMENT FOR RADIOLOGY SERVICES

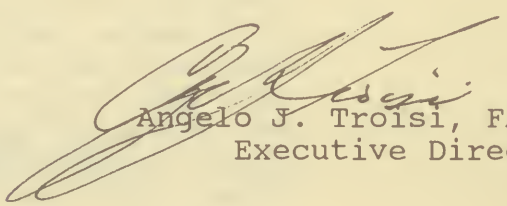
Beginning January 1, 1989, Medicare reimbursement for radiology services furnished or supervised by American Board of Radiology (ABR)-certified or ABR-eligible physicians or by those for whom radiology services account for at least 50% of their total Medicare submitted charges will be based on a fee schedule. The radiology fee schedule will apply to all CPT4/HCPC procedure codes for diagnostic and therapeutic radiology services, nuclear medicine, and certain radiation therapy services.

BC/BS MEDCASH

Blue Cross and Blue Shield of Maryland recently began test marketing MEDCASH, a credit card to be used strictly for medical and other health expenses, in the Baltimore area. Over 300 health professionals have agreed to accept the card for payment of services not covered by health insurance. Card users qualify for an initial credit line ranging form $1,000 to $5,000 and can seek extended levels of credit in case of emergency by calling an 800 number. BC/BS plans to make the MedCash Card available to Blues organizations in other areas of the country.

WOMEN IN MEDICINE COMMITTEE

A new Ad-Hoc Committee on Women in Medicine recently was organized and will address issues of concern to women physicians such as leadership development for women, day care programs, salary discrimination and recruitment of women into organized medicine. Margaret T. Snow MD was appointed as Chairman. For more information regarding this committee, contact Michelle Burke, staff representative, at 539-0872 ext 305 or 1-800-492-1056.



KRAUSE PORTRAIT

A portrait of Louis A. Krause MD was donated to the Faculty by the Board of Trustees of the former Lutheran Hospital of Baltimore. Painted by Betty Wells in 1963 on the occasion of Dr. Krause's retirement from the hospital, the portrait will be displayed at the entrance to the Faculty's History of Medicine Room.

AWARDS

The National Commission on Correctional Health Care recently presented the Faculty with a recognition award "For its concern that incarcerated adults and juveniles receive adequate medical care and its participation in the nationwide accreditation program for prisons, jails and juvenile facilities." Med-Chi thanks all component societies who contributed to the receipt of this award by helping to improve health services in Maryland's jails, prisons and juvenile facilities.

Med-Chi's "Women In Medicine" exhibit was recently honored by The Southern Medical Association Auxiliary with the Medical Heritage (Research and Romance) Award for the Best Statewide Exhibit at the Southern Medical Convention in New Orleans.

Angelo J. Troisi, FACHE
Executive Director

YOUR MARYLAND MEDICAL POLITICAL ACTION COMMITTEE

AT WORK IN 1988*

The following is a list of statewide elected officials who have requested and received contributions from MMPAC during 1988. The list is provided to show the membership how evenly contributions are distributed across the state. Consequently, money received from physicians generally goes back into their communities in the form of these contributions.

In 1990 a statewide election will be held in which all statewide offices will be elected. Now is the time for physicians to send in their PAC dues so that we may begin building our account to get ready for the 1990 elections.

You may still ask, "What has Med-Chi and MMPAC done for me lately?"

- physician efforts in Tort Reform have had a dramatic impact on the rise in medical malpractice premiums. In fact, just last month, Med-Mutual announced a 10% dividend, the first one of its kind in the history of the company.

- physician efforts have stopped Mandated Medicare Assignment for the last two legislative sessions. However, this fight will continue during the 1989 Maryland General Assembly.

- physician efforts have retained control of the peer review and credentialing process in Maryland. After a long battle with attorneys and citizen-consumer organizations.

- physician efforts have raised the standard of evidence necessary to find a physician in violation of the Medical Practice Act from a preponderance of the evidence to clear and convincing evidence.

- physician efforts were successful in prohibiting optometrists from enlarging their scope of practice to include the administration of topical ocular agents.

CALL TOLL FREE IN MARYLAND 1- 800-492-1056

• physician efforts have fought and blunted virtually every effort to infringe on your independence and autonomy as practitioners of the healing arts.

All of you have recently received your dues notices from Med-Chi. Although some of us may not like to admit it, there is a growing trend to have decisions about health care made in the political process. It is important that our voices be heard and our arguments be presented in the political forum. Please help us do that.

Quality Practice Digest

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state.

The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

The following are ethical opinions adopted by the Faculty:*

108. SECOND OPINIONS

.01 The patient has a right to choose his physician unless the patient agrees to limit that choice by contract.

.02 When a second opinion is required by an insurance or similar program, both the treating physician and the second physician should explain their respective roles to the patient. The second physician should not actively encourage or induce the patient to change physicians.

.03 Should the patient freely choose to transfer his medical care, the second physician may accept the patient if he so chooses. The treating physician should honor the patient's choice.

.04 Should the second physician disagree with the treating physician's opinion, a third opinion should be suggested. Whatever the outcome, the second physician should strive to communicate with the treating physician. (PEC 6/27/85)

.05 A physician who renders a second surgical opinion may be asked to assist in the surgery. While not in and of itself unethical, the situation presents great opportunity for abuse. Accordingly, a physician rendering a second surgical opinion should only assist in that surgery if no other qualified physician is available. (PEC 11/19/88)

---

* Except for the recently adopted Ethical Opinion 108.05, these opinions appear in the supplement to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland (November 1985).

507. PAYMENT FOR COMPLETION OF INSURANCE FORMS

.01 Completion of simple insurance claim forms is provided as a service to the patient, without charge. However, in circumstances where a claim requires research, an examination of previous records, etc., it is permissible to make a reasonable charge.

.02 It is appropriate to base these charges on the volume, effort, and time devoted to such activity in his office. It is the physician's prerogative to determine the extent of this service.

.03 Charges for completion of insurance forms for the patient to collect for lost time or hospitalization payment unrelated to hospital bills are appropriate as are charges where information must be abstracted from records for completion of forms. (MC 10/4/61, 2/8/72; P/PRC 6/6/74; Revised PEC 5/7/85)

508. PAYMENT FOR SERVICES RENDERED BY TWO OR MORE PHYSICIANS

.01 When one physician covers for another, only one physician may bill for the services rendered. Double billing is strictly forbidden.

.02 The bill should clearly inform the patient of the exact medical services included in the bill, the date these services were provided, and whether those services were consultative or direct care.

.03 When two or more physicians working in partnership or professional association call on each other for consultation, the medical necessity for such consultation should be clearly documented. If a pattern appears of consultations requested when apparently not medically necessary, peer review action may follow. (P/PRC 12/14/72; Revised PEC 1/24/85)

Meridian wants you to know

What you should know about Meridian Healthcare services and facilities.

Meridian Healthcare is Maryland's largest provider of long-term nursing care. We operate eighteen Meridian Nursing Centers throughout the state, including Meridian Multi-Medical, a unique nursing center with many sub-acute-care services.

We offer rehabilitative services, such as occupational, physical and speech therapy, short-term, or "respite" care, as well as long-term residency in bright, modern surroundings.

Meridian has prepared a referral information kit detailing our facilities and services. In it you will find a digest of our services and information on how you and your patients' families can take advantage of them. Each of our eighteen centers is profiled in a manner structured to aid you in helping your patients and families with selecting a nursing center.

This kit is available without charge to physicians and hospital administrations. To obtain a copy for your office, please call or use the coupon below.

YES! You Can Submit CHAMPUS Claims Electronically!

Beginning on February 1, 1989, Health Communication Services (HCS) will offer electronic transmission for your CHAMPUS claims.

Why send CHAMPUS claims electronically?

- **Fast Turnaround.** Claims are transmitted and delivered to the carrier the same day—no mail delays.
- **Prompt Reimbursement.** Historically, 82% of electronic claims are paid in ten days or less.
- **Adjudication Response.** You will receive acknowledgment whether your claim was paid, pended or denied.
- **Good Business Sense.** Sending claims electronically reduces administrative costs, increases staff productivity, and improves cash flow.

HCS can also provide you with on-line benefits and eligibility information from our national Medicare A&B database. And we can transmit your commercial claims to twenty-five of the nation's largest commercial carriers.

To transmit claims through HCS, you can choose from three data input options:

- We can provide the software to key your claims in from a P.C. or...
- We can receive claims direct from your computer (RJE) or...
- We can develop an automatic download from your system to ours—no manual intervention or re-keying required.

A few of the vendors who have developed their own HCS interface are Southeast Medical Computer Systems, Automation Management, Inc., Monette Information Systems, Medical Manager, and MTI.

For more information about our services, please call us at **1-800-543-6311.**

Health Communication Services, Inc.

Frank J. Ayd, Jr., MD is the first American psychiatrist to receive the Open Mind Award. The award, presented by Queen Fabiola of Belgium, is given to scientists who are receptive to new ideas and have made contributions to the treatment of mental disorders.

A graduate of Loyola College, Baltimore, and the University of Maryland Medical School, Dr. Ayd is emeritus Director of Professional Education and Research at Taylor Manor Hospital, Ellicott City, and Clinical Professor Psychiatry at the West Virginia University Medical Center, Charleston.

• • • • •

James B. Brayton MD has been named chairman of the Department of Pediatrics at Franklin Square Hospital Center. Dr. Brayton, who has been in private practice in Bel Air since 1983, has a medical degree from Tulane University School of Medicine as well as a degree in veterinary medicine from Cornell University College of Veterinary Medicine. He has served as director of the Division of Comparative Medicine at the Johns Hopkins University School of Medicine, medical director of the Children's Comprehensive Care Clinic at The Johns Hopkins Hospital, and associate professor of Pediatrics and Comparative Medicine at the Johns Hopkins University School of Medicine.

• • • • •

Liebe Sokol Diamond MD has been elected president of the Medical and Dental Staff of the James Lawrence Kernan Hospital. Dr. Diamond, a specialist in pediatric orthopaedics, has served on the Kernan medical staff for more than 20 years. Serving with Dr. Diamond are vice-president **Joseph Ciotola MD**, an orthopaedist; and secretary-treasurer **Selvin Passen MD**, a pathologist.

• • • • •

Daniel C. Hardesty MD, Towson, recently was named chairman of the Department of Medicine at Franklin Square Hospital Center. Dr. Hardesty joined the staff at Franklin Square in April 1986 as associate program director for the Internal Medicine Residency Program and was named director of that program in 1987. He is a summa cum laude graduate of the University of Maryland School of Medicine.

• • • • •

Beryl Rosenstein MD of the Hopkins Department of Pediatrics has been named as medical director for Mt. Washington Pediatrtic Hospital, under a collaborative clinical relationship between the hospital and The Johns Hopkins University School of Medicine.

As medical director for Mt. Washington Pediatric Hospital, Dr. Rosenstein is responsible for administrative oversight of clinical operation, clinical teaching affiliations, quality review, program development, and collaborative research. He will continue to serve as associate chairman of the Johns Hopkins Children's Center and associate chairman of the Johns Hopkins School of Medicine. Mt. Washington Pediatric Hopsital is a regional private, not-for-profit pediatric specialty and rehabilitation center with a focus on pulmonary and physical rehabilitation. The hospital serves medically fragile infants, children, and adolescents.

• • • • •

William L. Thomas MD has been named medical director of Franklin Square Hospital Center. Formerly associate propgram director in the Department of Internal Medicine at Geisinger Medical Center in Pennsylvania, Dr. Thomas came to Franklin Square in October 1984 as chairman of the Department of Internal Medicine. He is a graduate of Duke University, did postgraduate training at Columbia University, and received his medical degree from the University of Connecticut.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

The Management of Uncommon Malignancies of the Breast (Part II)

Minimal Breast Cancer

This is a poorly defined condition of early infiltrating breast carcinoma. The size of the tumor must be less than 1 cm. There is 5 percent chance of metastases to the axillary lymph nodes. These patients have 75 percent five-year disease-free survival. Some reports include these patients with in situ carcinomas, which may reflect poorer survival rates. Once the carcinoma becomes infiltrating, it has a more aggressive behavior and should not be given a separate category or added to the in situ carcinoma.

Stage III Breast Cancer

This is locally and/or regionally advanced disease with no clinical or radiological evidence of distant metastases. If the disease can be resected, eliminating the primary and the regional metastases, this should be carried out and followed by adjuvant chemotherapy with or without hormonal therapy. On the other hand, if the disease is extremely advanced locally and/or regionally, preoperative chemotherapy, hormonal therapy, or a combination of these for three courses may result in massive response that renders the patient an excellent candidate for potentially curative or at least palliative surgery. However, nonresponders are treated by radiation therapy. After surgery or irradiation, the patient should continue on systemic therapy.

Metastatic Adenocarcinoma in the Axilla

Occasionally, a patient may present with an enlarged axillary lymph node(s) and no palpable breast masses. In such a case, it is advisable to obtain a mammogram prior to biopsying the axillary lymph node. If the mammogram shows a suspicious lesion in the breast, such lesion should be localized and biopsied first. However, if the mammogram reveals no suspicious lesions, the lymph node is then biopsied to rule out hyperplasia or lymphoma. On the other hand, if metastatic adenocarcinoma is diagnosed in that lymph node, the pathologist must be consulted for possible sites of origin. The patient also must undergo complete work-up for other sites of primaries especially lung, gastrointestinal tract, and possibly the kidneys. If no primary lesion is identified in any of these sites, the probability still exists that the breast is the site of the primary. The situation must be explained to the patient along with recommendation of carrying out a modified radical mastectomy. It will be necessary to alert the pathologist and ask for close sectioning of the breast in the hope of identifying the primary site.

Primary Squamous Cell Carcinomas of the Breast

These are rare and usually present in advanced stage. In such cases, the treatment of choice is radical or modified radical mastectomies. If detected early, partial mastectomy with axillary dissection and possibly breast irradiation may be applicable. The patient must also undergo the same initial work-up on the follow-up as in any case of epidermoid carcinoma. It is important to ensure that the lesion is not metastatic from other primary sites.

Melanoma of the Skin of the Breast

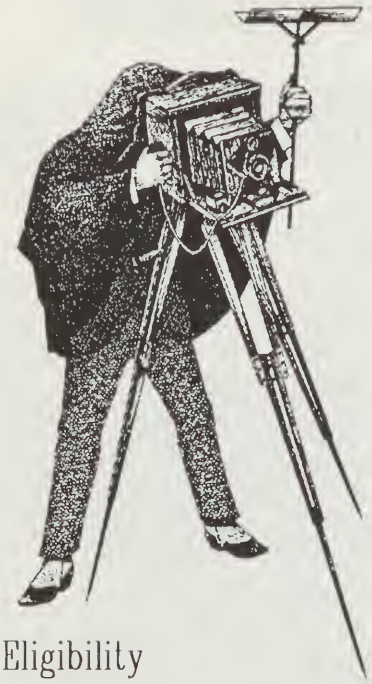
This is a rare condition and should be managed like any other cutaneous melanoma. This includes wide excision, and the patient must undergo the same work-up and follow-up as for any other melanoma.

Adenoid Cystic Carcinomas of the Breast

These are extremely rare and are managed by wide resections. Although it has low-grade malignancy, long follow-up of the patient is important because it tends to metastasize late.

Sarcomas and Lymphomas of the Breast

Several types of sarcomas and lymphomas have been observed in the female breast. These include Hodgkin and non-Hodgkin lymphomas, fibrosarcomas, liposarcomas, rhabdomyosarcomas, angiosarcomas, and most commonly cystosarcoma phylloides.



The majority of cystosarcoma phylloides are benign giant fibroadenomas and are managed by local excision. Malignant cystosarcoma phylloides are managed by simple mastectomy if the lesion is larger and involves most of the breast tissue. However, if the lesion is small, it can be treated by partial mastectomy as long as the margins of resections are free of tumor. The patient is observed for hematologic and regional lymph node metastases. Metastases to axillary lymph nodes are rare, and therefore axillary dissection is not required.

Other sarcomas are managed similarly. Postoperative irradiation is indicated for poorly differentiated sarcomas.

Lymphomas of the breast should be managed like other lymphomas by accurate staging and are treated in collaboration with the medical and radiation oncologists.

If you have any questions, call or write the Surgical Oncology Program at the University of Maryland Medical System, Room N13E02, Baltimore, Maryland 21202 (301-328-5224).

Ninth Annual Med Chi Photo Contest

Enter Early -- Deadline For Entries: March 15,1989
Two Categories: Black & White Or Color
Open to Med Chi Members and Auxiliary Members
All Photographs on Display at the
Turf Valley Country Club
During the 1989 Annual Meeting
First and Second Prizes Awarded in Each Category

Eligibility

All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

Contest Rules

1. Photographs may be submitted in two categories-- Black and White or Color.

2. Limit: three entries per person

3. Entries must have name address, and telephone number attached to the back of each photograph.

4. Prints only, no smaller than 8x10 or larger than 11x14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.

5. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on March 15, 1989.

6. Entries must be matted or dry mounted. No framed photographs will be accepted.

7. Photographs entered in the contest will be on display at the Annual Meeting in April of 1989.

8. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 12 thru 14, 1989.

9. Photographs will NOT be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting on Friday, April 14, at noon or at the Faculty Building thereafter.

10. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

11. Prizes will be awarded to the FIRST AND SECOND place winners. Additional information about the prizes will be published in the Journal.

The Second George Entwisle Lecture in Hypertension: Is Cure for Hypertension A Reasonable Goal?

HERBERT G. LANGFORD MD

On his retirement, George Entwisle MD, who served for eight years as Commissioner on the Maryland Commission on High Blood Pressure and Related Cardiovascular Risk Factors, was honored by the establishment of an annual lectureship at the University of Maryland School of Medicine, Department of Epidemiology and Preventive Medicine. We present a summary of the second inaugural lecture, given in May 1988. Much of the material presented was derived from the Hypertension Detection and Follow-up Program or from studies that followed. Both Drs. Entwisle and Langford were investigators in the HDFP.

We know that antihypertensive therapy reduces mortality and morbidity, even for individuals with mild degrees of blood pressure elevation.[1,2] However, pharmacologic therapy induces undesirable symptoms in some patients, as well as biochemical effects that may partially negate the beneficial consequences of lowering blood pressure. It is moderately expensive to the patient. Moreover, a very large proportion of the population is at risk for treatment. To take an extreme example, if we categorized patients by one random blood pressure taken at home (which of course should not be how we define hypertension), we might decide that half the population of center city Baltimore, Maryland or Jackson, Mississippi must be on antihypertensive therapy. Even if we lower the percentage of the population defined as needing treatment by measuring the blood pressure repeatedly over some weeks, 25 percent of the over 50 years of age population in low income areas may need treatment.

Must We Treat Hypertension Forever?

The Hypertension Detection and Follow-up Program (HDFP) described below gave us an opportunity and an incentive to determine whether prolonged antihypertensive therapy would "cure" a substantial percent of rigorously treated hypertensive patients and whether nutritional change would add to the chance of continued normotension. The patients in this program had been treated for five years.

How many would stay normotensive if: (1) we withdrew the antihypertensive drugs and made no other lifestyle change, (2) we withdrew the drugs and randomly assigned the participants to a weight loss program, or (3) we withdrew the drugs and randomly assigned the participants to a low-sodium diet?

Dr. Langford is Professor of Medicine and Chief, Division of Endocrinology and Hypertension at the University of Mississippi Medical Center.

IIBP Commentary is contributed by the Maryland Connussuion on IIigh Blood Pressure and Related Cardiovascular Risk Factors, 201 W. Preston St., Baltimore, MD 21201 (301-225-5891). Editors: R. Patterson Russesll MD, Past Chairman; Donald O. Fedder PharmBS, DrPII, Chairman; and Carol Lewis MPII, ScD, Executive Director.

Background of the HDFP

The HDFP was a community based, randomized clinical trial involving 11,000 hypertensive participants at 14 centers around the country. The study compared the effect on all-cause mortality of systematic antihypertensive treatment, designated as stepped care (SC), with treatment provided by community sources of medical care, designated as referred care (RC). The principal finding after five years was a statistically significant 17 percent lower five-year mortality for the SC group compared with the RC group. Subsequently, five-year incidence rates of stroke, coronary heart disease, angina pectoris, and left-ventricular hypertrophy were found to be significantly lower in SC than in RC participants. These beneficial results in SC are thought to be a consequence of the more effective treatment of high blood pressure achieved in SC compared with RC.

The HDFP 6.7-year life-table mortality rates revealed an even larger mortality difference than was observed at five years. This favorable finding for SC extended to all major subgroups, including white women and those persons aged 30 to 49 years at trial entry. Six months after the close of the treatment trial a two-year posttrial surveillance study, which extended mortality follow-up to 8.3 years, was begun. Results showed that the posttrial use of antihypertensive medication had declined in SC and had increased in RC participants, so that by the end of the posttrial period there was little difference in the percentages of SC and RC participants taking medication.[3] Control of blood pressure, indicated by percent of participants with a mean diastolic pressure of 90 mm Hg or less, was slightly better for SC than for RC participants (SC group: 86.5 mm Hg and 69 percent controlled; RC group: 87.8 mm Hg and 62 percent controlled). The absolute mortality advantage found at 6.7 years persisted and increased throughout the posttrial period of follow-up, despite discontinuation of the formal SC therapy program. It is thought that regression of hypertensive end-organ changes brought about by the more effective SC treatment may have accounted for this favorable outcome.

Other data support the concept that prolonged antihypertensive therapy may cause changes in the pathologic and/or physiologic consequences of hyper-

tension, such as regression of hypertrophied smooth muscle in the hypertensive arteriole.[4] Other studies have suggested that, to varying degrees, amelioration of the severity of hypertension after prolonged antihypertensive therapy does occur.[5]

Dietary Intervention in Sustained Hypertension

To try to answer the questions posed above about the necessity of continued antihypertensive therapy, we decided to do a study that we later called DISH (Dietary Intervention in Sustained Hypertension).[6]

Three former HDFP clinics joined in the DISH study. Participants who had been in the stepped care groups at medical schools in Jackson, MS, Birmingham, AL, and Einstein in the Bronx, NY were invited to participate in the study. Of slightly more than 500 eligible patients who had been normotensive while receiving antihypertensive drug therapy, 496 were randomized into a control group and into discontinued medications groups with and without dietary intervention. The control group was continued on antihypertensive therapy. The discontinued medication groups included: (1) medication stopped with no diet change, (2) medication stopped with a behavior-oriented dietary program aimed toward weight loss, and (3) medication stopped with a diet program aimed toward sodium restriction and increased potassium intake.

Success of the Diet Change Groups

Figure 1 shows the success with weight loss. By 32 weeks the mean reduction was 10 pounds, and there was actually a slight increase in the weight loss by 56 weeks. These results are in marked contrast to those I normally get in my practice. Most of my patients gain slightly when I encourage weight loss. Most of the patients referred to a hospital-based dietitian for one or two consultations, in my experience, do very little better than the patients I attempt to counsel myself.

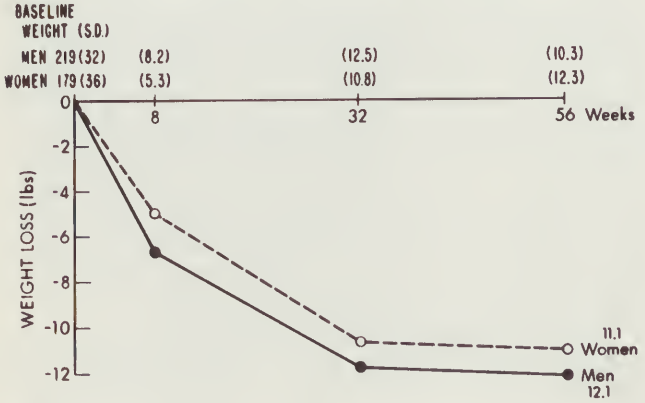
Sodium excretion was reduced by about one-third in those randomized to a low-sodium diet, reaching an excretion of about 100 milliequivalents (5.85 grams NaCl) per day. This reduction was not as marked as we desired. However, it is about as low as one can get one's sodium excretion without using salt-free bread and other nonappealing foods.

I consider our results with weight loss excellent, as well a tribute to the program devised by Dr. Arline Caggiula and Rene Wing and carried out by our nutritionist. The program is administered to groups and involves working with the participants to enable them to change their behavior, not merely telling them which foods have high calorie content.

Although the results with sodium restriction were not at our desired goal, the sodium excretion our patients reached was about the level that most intervention studies have reported.

Medication was withdrawn from three groups of the participants, and they were followed regularly. If they became hypertensive again, they were restarted on antihypertensive medication. Figure 2 shows the cumulative percentage who were not taking antihypertensive medications, by intervention group. We show the results separately for those who were overweight and those who were not overweight. (Those who were not overweight were not randomized to weight reduction.) The greatest difference in the 56-week success rates was between the control and the weight reduction groups in the overweight division. Sixty percent of the weight reduction patients were still normotensive at the end of one year, compared to 35 percent for those just withdrawn from medication with no dietary interven-

Figure 1. WEIGHT LOSS IN WEIGHT REDUCTION GROUPS



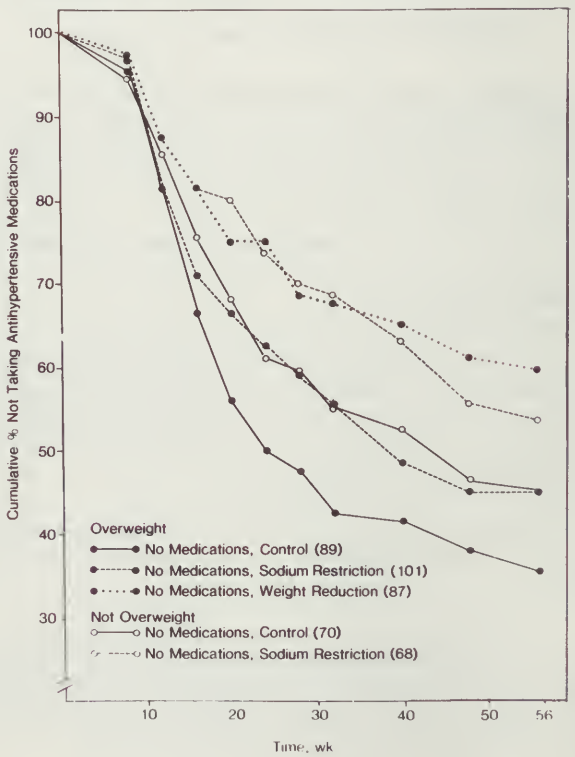


Fig 2.—Cumulative percent not taking antihypertensive medications, by intervention group—total.

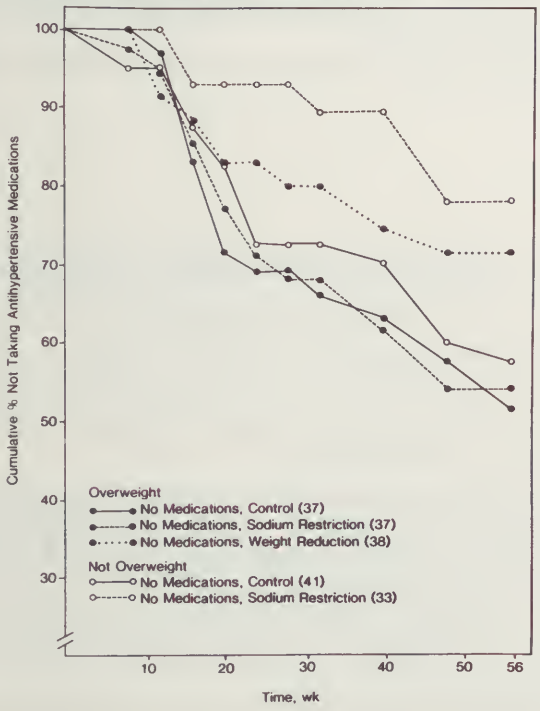

tion and 45 percent for those withdrawn from medication and put on a sodium restriction diet.

Figure 3 shows results more applicable to the average hypertensive patient. These results are for the mild hypertensive individuals, defined as those with initial blood pressure between 90 and 105 mm Hg at the beginning of the HDFP study and not on antihypertensive medication: relapse was much slower for these individuals even without diet change. Overweight participants relapsed more rapidly than those not overweight. Those who were overweight and had no diet change were slightly more likely to relapse than those who were not overweight. However, those randomized to sodium restriction were much more likely to relapse if they were overweight than if they were not overweight, 54.1 percent remaining off antihypertensive medication in the overweight group and 77.8 percent remaining off antihypertensive medication in the nonoverweight group. The group that had the best clinical outcome was the nonoverweight group randomized to sodium restriction, where 77.8 percent of the participants were off antihypertensive medications and not hypertensive at the end of one year.

Because this study stopped at 56 weeks, we cannot say how long our patients would have remained normotensive if their decreased sodium intake and their decreased weights were maintained and no medication was added. However, Stamler and colleagues did a similar study where participants restricted both their sodium intake and their calorie intake.[5] They continued to get favorable results for the four years over which they followed their population.

Fig 3.—Cumulative percent not taking antihypertensive medications, by intervention group—mild hypertensive persons.

Results of Diet Change in Untreated Hypertensive Patients

Despite the prolonged enthusiasm for weight and electrolyte changes in the treatment of hypertension, there is a paucity of studies about the success rate in blood pressure control of large groups of hypertensives subjected to dietary change. Most of the successes have come from studies of very small groups of individuals with moderately severe hypertension who reduced their sodium intake from quite high to quite low levels or who attained greater weight change than the 10 pounds we have reported. It is likely that diet change is an inadequate sole antihypertensive therapy when applied to the pharmacologically untreated hypertensive patient.

Why does the hypertensive patient who has been under drug therapy respond better to dietary management? The reader will recognize that I have not proved conclusively that diet management is ineffective as sole therapy. I believe there is adequate evidence to prove that in the literature. However, there are strong reasons to believe that diet therapy should be more effective after drug therapy has been applied (or applied simultaneously with drug therapy) than in the untreated hypertensive individual.

The dietary study I just reported showed how slow was the relapse in the usual patient when drug therapy was withdrawn. Moreover, we found that the lower the blood pressure had been titrated by antihypertensive medication, the slower was relapse, even when the computer took into account all the other factors, such as severity of hypertension and number of drugs used, which affected relapse. Apparently something favorable to hypertension had happened with prolonged drug therapy, and that something favorable was more marked if the blood pressure was titrated to a quite low level, for instance below 80 mm Hg than if it was just at 90 mm Hg. The concepts of Folkow provide a reasonable explanation of these results.[7] He has reminded us of the fact that the arteriole in the hypertensive patient steadily develops thicker walls as hypertension progresses. These thick-walled vessels constrict the lumen more when stimulated than do thin-walled vessels. Hypertension induces arteriolar hypertrophy; arteriolar hypertrophy increases hypertension. Prolonged antihypertensive therapy allows regression of this hypertrophy. Therefore, the patient has a lesser tendency to become hypertensive. He still has some tendency to become hypertensive, as shown by the fact that our individuals did relapse. However, if some of the precipitating causes of relapse are removed, by proper dietary change, then the tendency towards hypertension developing becomes much less.

Can Hypertension be Cured?

Therefore, it seems possible that the multiplicative hypertrophic components that abet and sustain hyper-

tension can sometimes be removed by prolonged antihypertensive therapy. If the patient will then follow the kind of diet that he/she should have followed all along (one directed toward lack of obesity, a low sodium intake, and probably a high potassium intake) he or she will, with considerable likelihood, remain normotensive.

The considerations above suggest that we can say that hypertension can be cured. It is a reasonable hope to hold out to mild hypertensive patients. However, attainment of that cure will require patients to be faithful in taking of the antihypertensive drug(s) and will require providing patients with appropriate behavior-change-based nutritional programs that will allow them to reduce weight and change their electrolyte intake in a favorable manner.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

One Minute with Diabetes

Noninjection Insulin

Doctor, will there ever be a type of insulin that I do not have to inject?

Researchers have been experimenting with two noninjection routes for administration of insulin.

One method uses a nasal spray of insulin solution to be absorbed through the mucous membrane (avoiding the digestive tract). It is applied with a hand-held nonpressurized aerosol device in a concentration of 250 U/ml. This mode of administration requires about twenty times more unitage than if it were being given subcutaneously. The rate of action is rapid and similar to insulin being given intravenously. It needs to be done frequently, causes some nasal irritation, and is difficult to adjust in proper dosage. Intranasal insulin administration possibly has usefulness before meals as a supplement to subcutaneous intermediate- or long-acting insulin. The technique definitely needs more study.

Another method is to use a capsule or protective shield to protect the insulin from being destroyed by the digestive action of the stomach and small intestine, yet be available to be taken into the circulation when it reaches the large intestine. This encapsulation is possible with polymers cross-linked with azoaromatic groups forming an azopolymer coating that disintegrates in the large intestine. This method requires more study and evaluation before it can be offered for clinical trials.

Researchers are working on other methods of treating diabetes that will make daily injections obsolete, but only the insulin pumps (still injectable insulin) are ready for large trials at this time.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

In the Matter of
Raymond F. Bayerle MD
Before the
Maryland State Board of
Physician Quality Assurance

Order for Summary Suspension
of License to Practice Medicine

Based on information received by the State Board of Physician Quality Assurance (the "Board"), the Board hereby issues as set forth herein Findings of Fact, Conclusions of Law, and Order for Summary Suspension (the "Emergency Suspension") with regard to the license to practice medicine of Raymond F. Bayerle MD (the "Respondent").

Findings of Fact

Based on information made known and available to the Board as of the date of the issuance of this Emergency Suspension, the Board has reason to believe the following facts are true:

1. Respondent is licensed to practice medicine in the State of Maryland.

2. Respondent possesses Maryland Controlled Dangerous Substances (CDS) Registration Number M15994, which expired June 30, 1988.

3. Respondent possesses United States Drug Enforcement Administration ("DEA") Registration Number BB 0388721, which expires July 31, 1990.

4. Sgt. Robin Dewberry of the Baltimore County Police Department, working in an undercover capacity using the assumed name of Mike Wolfe, purchased two (2) prescriptions from Respondent for a total price of $400. Respondent wrote both prescriptions in the presence of Sgt. Dewberry while seated in the passenger seat of his 1987 Pontiac Firebird bearing Maryland Registration TBX 056 at 6461 Red Keel Rd. in Columbia, MD, on September 8, 1988. The prescriptions were for Dilaudid 4 mg, #100 each in the names of X and Y. Neither X nor Y were present when Respondent wrote the prescriptions.

5. On September 12, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of Bob Morgan dated September 13, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of John Miller dated September 14, 1988, to Sgt. Dewberry for $200 each. Neither Bob Morgan nor John Miller were present when Respondent wrote the prescriptions.

6. On September 14, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of John Wright dated September 15, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of Mike Wolfe dated September 16, 1988, to Sgt. Dewberry for $200 each. John Wright was not present when Respondent wrote the prescription. Although Mike Wolfe (aka Sgt. Dewberry) was present when Respondent wrote the prescription, Respondent did not take a history or perform a physical examination. Mike Wolfe did not seek medical care or treatment from Respondent when Respondent wrote the prescription. Mike Wolfe never had a patient-physician relationship with Respondent.

7. On September 20, 1988, Respondent sold a prescription for Dilaudid 4 mg, #100 in the name of Larry Brown dated September 22, 1988, and a prescription for Dilaudid 4 mg, #100 in the name of Greg Welsh dated September 22, 1988 to Sgt. Dewberry for $200 each. Neither Larry Brown nor Greg Welsh were present when Respondent wrote the prescriptions.

8. Respondent wrote the prescriptions mentioned in paragraphs 4,5,6, and 7, after his Maryland CDS Registration expired on June 30, 1988. Dilaudid is a Schedule II controlled dangerous substance that may only be prescribed by a practitioner with a valid Maryland CDS Registration and a valid United States DEA Registration.

9. It is unlawful for a practitioner to prescribe any controlled dangerous substances except in the course of his regular professional duties and in conformance with the provisions of Article 27, Subtitle Health-Controlled Dangerous Substances, *Annotated Code of Maryland*, and the standards of his particular profession relating to controlled dangerous substances (See Article 27, 288(c), *Annotated Code of Maryland*).

10. Based on the above Findings of Fact, the Board has reason to believe that Respondent has violated 14-504(a) (2), (3), and (28) of the Maryland Medical Practice Act, Title 14, Health Occupations Article, *Annotated Code of Maryland* as follows:

> (2) fraudulently or deceptively uses a license;
> (3) is guilty of immoral or unprofessional conduct in the practice of medicine; and
> (28) sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

Respondent may, after notice and an opportunity for a hearing, be reprimanded, placed on probation or have his license suspended or revoked as set forth in the Charge Letter attached hereto as Exhibit A.

11. Writing prescriptions for Dilaudid for an individual without taking a history or performing a physical examination poses a risk to the health, safety, and welfare of that individual.

12. Writing prescriptions for Dilaudid without a legitimate medical reason poses not only a risk to the health, safety, and welfare of the individual for whom the prescription is written, but also poses a risk to the public health, safety, and welfare.

13. Based on the allegations in paragraph 6 above and on other information, United States DEA Agents arrested Respondent on September 22, 1988 at 6461 Red Keel Rd. pursuant to a warrant for arrest.

On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law, and Order" will be published in the Maryland Medical Journal.

14. Based on the allegations in paragraphs 4, 5, and 6 above and other information, United States DEA Agents executed a search and seizure warrant on Respondent's home at 6461 Red Keel Rd. on September 22, 1988. The search did not reveal any patient records in the names of John Miller, Bob Morgan, John Wright, Mike Wolfe, Larry Brown, or Greg Welsh.

15. Respondent was indicted as a result of the allegations in paragraphs 4, 5, 6, and 7 above and other information in Criminal Number HAR 88-0336, *United States of America v. Raymond Francis Bayerle*, in the US District Court for the District of Maryland. An arraignment on the charges is scheduled for October 7, 1988.

16. Respondent is being held in the Baltimore City Jail without bail. Any time prior to trial, Respondent may request a bail review hearing. A bail review hearing may be scheduled within twenty-four hours.

17. Although Respondent is presently incarcerated, Respondent is still capable of making telephone calls and could telephone prescriptions using his expired Maryland CDS Registration and United States DEA Registration.

18. Although Respondent is presently incarcerated, Respondent can receive visitors who could bring in prescription pads enabling Respondent to write prescriptions for drugs without a valid medical purpose.

19. Although Respondent is presently incarcerated, absent the suspension of his license, he can practice medicine and recommend treatment.

20. Although the US Assistant Attorney General has assured the Board that he will inform the Board immediately if the Respondent is released from the Baltimore City Jail, it is possible for Respondent to be released prior to the Board being notified.

21. If Respondent is released from jail, Respondent could practice medicine and write prescriptions unless the Board summarily suspends Respondent's license.

22. Respondent's retention of a Maryland license to practice medicine and his ability to prescribe controlled dangerous substances poses a grave risk and imminent danger to the public health, safety, and welfare of the citizens of Maryland.

Conclusions of Law

Based on the foregoing facts, the Board finds that the public health, safety, and welfare imperatively requires emergency action in this case, pursuant to State Government Article, 10-405(b), *Annotated Code of Maryland*.

Order

It is this 7th day of October 1988 by the Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by State Government Article, § 10-405 of the Annotated Code of Maryland, Respondent's license to practice medicine in the State of Maryland is hereby **SUMMARILY SUSPENDED**; and be it further

ORDERED that on presentation of this Order, Respondent shall immediately deliver or have delivered to the Board:

(1) his original license from the Board of Medical Examiners (License Number M 15994);

(2) his renewal card for his license to practice medicine from the Board of Medical Examiners;

(3) his US Drug Enforcement Administration Registration Certificate;

(4) his Maryland Controlled Dangerous Substances Registration Certificate and

(5) any prescription pads on which his name or registration number are imprinted; and be it further

ORDERED that a hearing to consider this emergency suspension shall be held before a Hearing Examiner within thirty (30) days of the date on which the Board receives a written request for such a hearing from the Respondent.

A Patient with Biliary Tract Obstruction and AIDS

We recently had an opportunity to care for a patient with biliary tract obstruction and acquired immune deficiency syndrome (AIDS). We present this case as an illustration of this uncommon manifestation of this syndrome.

A 34-year-old white male was hospitalized with a four-week history of watery diarrhea, 40 lb weight loss, and profuse night sweats. The diarrhea was described as 8 to 10 brown, watery bowel movements per day without blood, severe abdominal pain, or tenesmus. As intermittent fever to 103° F was noted for four days prior to hospital admission. The patient admitted to an eight-year history of intravenous drug use as well as heavy ethanol consumption. Homosexual contacts were denied.

On examination, the patient appeared cachectic and had marked temporal wasting. The initial temperature was 102.8° F. The blood pressure was 116/60 mm Hg with a pulse rate of 100 and significant orthostatic changes. The head and neck exam showed a white exudate on the palate and pharynx as well as significant palpable adenopathy in the anterior and posterior cervical areas. The lung fields were clear to auscultation, and the heart sounds were normal. The abdomen was soft, and there were normal bowel sounds. The liver was 7 cm below the right costal margin with a tender edge, and the spleen was not palpable. There was prominent inguinal adenopathy. The rectal examination was remarkable only for occult blood positive stools.

The initial laboratory profile showed a white blood cell count of 7,200/cu mm with 66 percent polymorphonuclear leukocytes, 24 percent bands, and a hematocrit of 29.4 percent. The serum chemistry analysis included an SGOT of 112 u/l (normal 12-45), SGPT of 40 u/l (normal 7-40), alkaline phosphatase of 674 u/l (normal 37-107), albumin of 2.5 gm/dl (normal 3.5-4.8), and a bilirubin of 0.6 mg/dl. The chest X-ray was normal. Blood and stool cultures were both positive for *Salmonella enteritidis*. A positive HIV-antibody assay was confirmed by western blot technique.

The patient developed pruritis and cholestasis with an increasing alkaline phosphatase to 998 u/l, SGOT of 130 u/l, SGPT of 46 u/l, and normal bilirubin. A CAT scan of the abdomen revealed a dilated common hepatic and common bile duct without intrahepatic ductal dilatation. There was a pericholecystic fluid collection, although no calculi were visualized. Fatty infiltration of the liver and generalized wasting of body tissues also were noted. A thickened gall bladder wall without calculi was discovered by abdominal sonogram.

The patient's diarrhea and fever abated on antibiotic therapy. The pruritis was refractory to antihistamines, and the patient refused cholestyramine. Any additional evaluation was refused.

The hepatic manifestations of AIDS have been reviewed recently.[1,2] The majority of liver biopsies done for fever, hepatomegaly, or abnormal liver blood tests do not provide a specific infectious diagnosis.[1,3] However, the finding of granulomas usually are indicative of an infectious process with M. avium-intracellulare, CMV, or fungal organisms.[1,3-5] Although there are few treatable hepatic manifestations of AIDS, it is interesting to note that rarely, if ever, do AIDS patients die as a direct result of liver disease.[4,5]

AIDS patients may have a clinical picture similar to that of sclerosing cholangitis or papillary stenosis, which have ultimately proved to be secondary to infections with CMV or cryptosporidia.[6-9] Although there is no proved effective medical therapy, these patients have undergone endoscopic sphincterotomy with good results.[8] There have been several case reports of patients with acute acalculus cholecystitis who have been found to have an underlying CMV or cryptosporidia infection.[10,11] We cannot state with certainty whether organisms are causative or simply represent a superimposed infection. It has been suggested that at least in the case of CMV infection, the mechanism is immunological and not direct inflammation related to the infectious process.

CARAFATE®
(sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE

There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088- 1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other. Issued 1/87

CAFAD276 0160N8

Carafate® for the ulcer-prone NSAID patient

Aspirin and other nonsteroidal anti-inflammatory drugs weaken mucosal defenses, which may lead NSAID users to become prone to duodenal ulcers.[1] For those NSAID users who do develop duodenal ulcers, CARAFATE® (sucralfate/Marion) is ideal first-line therapy. Carafate rebuilds mucosal defenses through a unique, nonsystemic mode of action. Carafate enhances the body's natural healing ability while it protects damaged mucosa from further injury. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate: therapy for the ulcer-prone patient.

Unique, nonsystemic

CARAFATE®
sucralfate/Marion

0160N8

THE LOWER RESPIRATORY TRACT—

More vulnerable to infection in smokers and older adults

Experience counts

Ceclor® Pulvules® 250 mg

cefaclor

think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins.
Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology
- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly). [061088L]

It has been said that some physicians are as uncomfortable entering a legislative hearing room as a layman would be walking into a surgical suite. The January 1989 issue of the Maryland Medical Journal is dedicated toward Med Chi's goal of assisting its members in understanding the entire legislative process so that they are comfortable not only entering a hearing room but also testifying before a committee. This second annual Legislative Issue and the accompanying Legislative Directory are valuable tools for physicians that will enable them to understand and influence the legislative process.

This year, Mandated Medicare Assignment, Tort Reform and Physician Triplicate Prescriptions are just a few of the many pressing issuing facing Med Chi in Annapolis. The outcomes of these issues will affect the future of medicine in our state. In order to be justly represented, it is necessary for Maryland physicians to become informed and involved.

Med Chi hopes that the information contained between these pages will bring physicians closer to active involvement in Annapolis--closer to having their voice heard in the State House.

MEDICAL and CHIRURGICAL FACULTY
of the STATE OF MARYLAND

1211 Cathedral Street Baltimore, Maryland 21201
(301) 539-0872 • Toll Free 1-800-492-1056

January 1989

Dear Colleague,

Doctors in the State House? Some may say, "It's a shame! They should be practicing...using their time caring for patients in their offices." But today, the reality is: It's a necessity! As physicians in 1989, our responsibilities lie in both treatment and legislative action. Physician involvement in the legislative process is the only way we can preserve and enhance a system that provides the finest quality medical care in the world.

But involvement is always more effective when it is based on information and education. For this reason, Med Chi is once again bringing you a special legislative issue of MMJ. In it you will find articles on the specifics and generalities of the challenges that face us this year in Annapolis. Understanding the issues and the process will underline why our presence in Annapolis is so important and why every member of Med Chi should take at least the first step toward becoming involved in the political process by joining the Maryland Medical Political Action Committee.

Patient care begins in the office, but it continues in the State House. As a physician today, quality care for your patients and active involvement in the legislative arena are integrally linked. For more information or to offer your assistance, please call the Med Chi Government Relations Department at 1-800-492-1056 or, in the Baltimore area, 539-0872.

Sincerely,

Michael R. Dobridge, M.D.

Independent Status for Hospital Medical Staffs: No Cause for Antitrust Alarm

ALAN M. RIFKIN, GARRET G. RASMUSSEN, GERARD E. EVANS, AND KENNETH L. GLAZER

In recent years, there has been a growing controversy surrounding the issue of so-called "independent status" for hospital physician staffs. During the late 1970s and early 1980s, some articles advanced the theory that any conduct creating the appearance of an independent status for the hospital staff separate from that of the hospital could generate the environment for an antitrust action. These early theories, however, failed to fully appreciate the basic nature of antitrust law and the changing role of the hospital medical staff. Indeed, the changing nature of the hospital medical staff and the current application of antitrust law strongly indicate the early theories are misplaced and the "independent status" of the hospital medical staff does not create cause for antitrust alarm.

This changing legal and operative environment has been reflected in pronouncements by the American Medical Association House of Delegates, which has recognized there may be a need for hospital staff physicians to have independent legal representation, separate from the hospital itself. The General Counsel of the AMA has written:

> The AMA House of Delegates has adopted the position that the Association strongly recommend that hospital medical staffs retain their own attorneys so that the medical staff will have its own legal advocates for guidance in appropriate circumstances (Johnson, *The Citation*, Vol. 54, No. 3 at 1 [1986]).

While instances may vary, the AMA has discussed that appropriate circumstances for independent status and counseling may include negotiation of contracts, certain credentialing and peer review decisions, aspects of accreditation standards, review of bylaws, joint venture participation, risk management programs and counsel, right to life issues, and physician quality assurance matters.

Furthermore, the current status of the issues raised in this area was ably addressed by the American Medical Association's Board of Trustees in June 1988 through its adoption of a Report, "Peer Review After *Patrick v. Burget*." This AMA Report, as much as any other single public document, signals that older antitrust concerns are being uprooted by new and even more challenging questions concerning the vitality and viability of those concerns.

Background

In previous years and for a variety of reasons certain hospital lawyers have warned that any independent status advanced by hospital medical staff could create what one article termed "a legal nightmare." Specifically it has been stated:

> [t]he biggest danger if the staff acts as or appears to be an entity separate from the hospital is that virtually every medical staff credentialing decision with a result adverse to the practitioner in question can be turned into a lengthy and potentially devastating antitrust suit (Mulholland, "The Evolving Relationship Between Physicians and Hospitals," XXI Tort & Insurance Law Journal 295, 307 [Winter 1987]).

Sound legal analysis strongly suggests that these threatened dangers are vastly exaggerated and have a tendency to cloud rational decision making by hospitals and effectively chill medical staff participation in important aspects of hospital practice. While cooperation between hospital and medical staff reflects the norm and is encouraged by all who seek to provide quality health care, the threat of antitrust action (inappropriately placed) could act to intimidate both a hospital and its staff from acting in a proper manner and in the best interest of the patient. It is to these issues that this article attempts to speak. Simply, the retention of independent counsel and the assertion of "independent status" appears to neither create nor increase antitrust liability in the eyes of the law. It is the substance of the action, not the form of the medical staff that controls.

Specter of Multimillion Dollar Antitrust Cases Vastly Exaggerated

The alarm over antitrust liability created by certain extended legal theories is largely unfounded. In the context of hospital medical staffs, antitrust issues typically have arisen most often in cases brought by physicians who have been denied staff privileges and referrals.

For a variety of reasons, these cases have been routinely dismissed by the courts. In addition to the court's concerns about its qualifications for reviewing peer review and privileging decisions, courts have been reluctant to subject these important decisions to "the

Messrs. Rifkin and Rasmussen are partners and Mr. Glazer is an associate of Patton, Boggs & Blow, a national law firm based in Washington, DC. The authors thank Martha Kendrick, an Associate at Patton, Boggs & Blow specializing in health care law.

draconian litigation involved under antitrust laws." (*see* AMA Report at 5). In 1988 alone there have been a number of such dismissals: *see Collins v. Associated Pathologists, Ltd.*, 844 F.2d 473 (7th Cir.), *cert. denied*, 57 U.S.L.W. 3233 (1988); *Cooper v. Anster*, 845 F.2d 1010 (3d Cir.), *cert. denied*, 57 U.S.L.W. 3233 (1988); *Nanavati v. Burdette Tomlinson Memorial Hospital*, 1982-2 Trade Cas. (CCH) 68,208 (3d Cir. 1988). *See also Bolt v. Halifax Hosp. Medical Center*, 851 F.2d 1273 (11th Cir. 1988) (dismissing all counts except those alleging conspiracy between separate hospitals); *Nurse Midwifery Associates v. Hibbett*, No. 82-3208 (M.D. Tenn. 1988) (same). Indeed, one court recently imposed sanctions on an attorney bringing such a case. *Mir v. Little Company of Mary Hospital*, ___ F.2d ___, No. 87-6269 (9th Cir. 1988).

Reflective of the court's reasoning in these cases is the following statement contained within *Pontius v. Children's Hospital*, 552 F. Supp. 1352 (W.D. Pa. 1982) wherein the court stated:

> [i]f individual physicians, who manage to overcome their traditional reluctance to testify about the professional conduct of a colleague, know that by so doing they risk incurring legal fees running into six figures and a trial of duration measured in months, on the mere allegation that they have conspired to restrain trade, the discovery of incompetent physicians will be rendered extraordinarily difficult.

Although many antitrust cases have been filed, it is not surprising that plaintiffs lose so many of these cases. The burden of proof on the challenging party to establish an antitrust violation is significant and often difficult to maintain. As a general rule, cases involving denial of staff privileges are tested under the antitrust law's so-called "rule of reason" (*see, for example, Miller v. Indiana Hospital*, 843 F.2d 139 (3d Cir.), *cert. denied*, 3235 [1988]), and very concrete, specific evidence is required. The same is true of cases involving denial of staff privileges to nonphysician health professionals, such as chiropractors and podiatrists *see for example, Wilk v. American Medical Ass'n*, 719 F.2d 207 (7th Cir. 1983), *cert. denied*, 467 U.S. 1210 [1984]). To prevail in "a rule of reason" case, a plaintiff must prove that the challenged conduct injures competition in a defined market and that such injury is not outweighed by procompetitive benefits.

In the staff privileges context, the rule of reason analysis focuses primarily on whether the hospital's conduct in revoking or denying staff privileges is based on a good faith assessment of the physician's competence or whether it is motivated by an overriding desire to fence out competitors and potential competitors. (*see Miller v. Indiana Hospital*, 843 F.2d 139, 144-45 (3d Cir.), *cert. denied*, 57 U.S.L.W. 3235 [1988]). The *Miller* case illustrates just how clear and specific the anticompetitive motivation must be before a court will allow the case to proceed to the jury. In the specific instance of *Miller*, to prevent dismissal of the case the plaintiff physician had to submit affidavits showing that the hospital was reacting to a competitive threat created by the plaintiff's decision to establish a comprehensive family oriented medical center two miles from the hospital and rather than that the plaintiff failed, for other reasons, to receive privilege at the hospital. Simply stated, the law requires a very specific showing of anticompetitive motivation, almost to the exclusion of other factors before an antitrust violation will be found.

If a hospital and its staff adopt objective and fair standards, maintain adequate documentation, and consult knowledgeable counsel (either independently or jointly) they should have little to fear from the antitrust law. For example, in *Cooper*, the hospital's requirements for making a physician eligible for patient referrals by the emergency room were: (1) completion of an internship and residency approved by the American Osteopathic Academy of Orthopedics; (2) certification in orthopedic surgery by the American Osteopathic Academy of Orthopedics; (3) status for at least three years as an active staff physician; and (4) admission of at least 50 patients per year from the physician's practice to the hospital's orthopedic service. The court held that these criteria are objective and relevant to a doctor's competence (obviously a matter of serious concern to the hospital) and therefore enforcement of these standards would not violate the antitrust laws.

As a recent American Bar Association publication correctly noted: "Antitrust problems arise only if the peer review process was a sham process used to exclude competent physicians for private, anticompetitive purposes" (ABA Antitrust Section Health Care Committee, *The Antitrust Health Care Handbook* (1988) at 19).

While in the recent case of *Patrick v. Burget*, 108 S. Ct. 1658 (1988), the Supreme Court held that the State Action Doctrine did not immunize peer review activities from the antitrust laws, the Board of Trustees of the American Medical Association, in subsequently adopting its June 1988 Report, concluded that the risks of legal liability when a physician participates in peer review are minimal, as long as the purpose relates to enhancement of good quality medicine and not a bad faith motive such as damage to a competitor, and as long as proper procedures are followed to ensure fairness. The AMA Report recommends additional protection from antitrust exposure through state passage of legislation both to further protect physicians from antitrust exposure and to provide different, but appropriate, legal remedies for peer review complaints. While antitrust cases in the medical staff arena have been largely unsuccessful:

> [t]hey have taken a toll. The cases have been expensive to defend and an emotional burden on the defendants. Some cases have been settled. There is no reliable information about the terms on which cases have been settled, but some may have resulted in payments by hospitals and defendant physicians to the plaintiff physicians.
>
> In addition, the threat of antitrust litigation may have influenced physicians on peer review committees not to recommend adverse actions. Again, there is no reliable information about the degree of influence that threatened antitrust litigation many have had on peer review decisions. But it is likely that physicians have been reluctant to risk being sued, even if confident that they would win, because of the emotional and financial burden of litigation.

Congress has injected itself into the peer review/antitrust debate motivated in part by the "overriding national need to provide incentive and protection for physicians engaging in effective professional peer review" through the passage of Pub. L. No. 99-660, the Health Care Quality Improvement Act of 1986 (42 U.S.C. Section 11101 *et seq.*, 100 Stat. 3784-94 [1986]). This statute vests immunity to individuals providing information to entities conducting professional review activities (including clinical privileges and membership determinations) as well as to individuals and entities who take professional review actions against physicians based on competence or conduct.

To receive antitrust immunity under the Act, certain standards must be met, for example, the professional review action must be taken in the reasonable belief that the action was in the furtherance of quality health care, reasonable efforts must be made to obtain the facts, and adequate hearing and notice procedures must be provided to physicians. As described, the Act essentially provides a safe harbor for peer review action if that action is taken "in the reasonable belief that [it] was in the furtherance of quality health care" Section 1112(a).

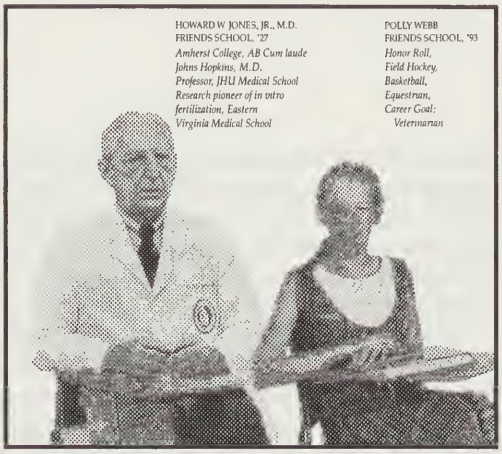
Independent Status Will Not Increase Antitrust Risk

In the late 1970s and early 1980s some lawyers, extending their reasoning from peer review cases, argued that even the appearance of an independent status by the medical staff would significantly increase exposure to "multimillion dollar" antitrust cases. Indeed, in a newsletter, *Action Kit*, written by counsel at the law firm of Horty, Springer and Mattern, it was advanced that consideration of independent status is "legally dangerous," will force hospitals to "close their doors forever," and will subject physician to "financial disaster." While such polemics may be good legal marketing (particularly for hospital clients) they constitute bad antitrust analysis.

Liability under Sherman Act 1 (the relevant antitrust law) requires an agreement, combination, or conspiracy among two or more entities, 15 U.S.C. 1. While a conspiracy cannot be found within a single corporate entity, *see Copperweld Corp. v. Independence Tube Corp.*, 467 U.S. 752 (1984), the fact that a medical staff seeks independent counsel will not increase the risk that an unlawful combination or conspiracy will be found.

Contrary to the assertion of certain counsel, preserving or eliminating the form or appearance of a single organization will *not* be dispositive of whether hospital staff physicians violated antitrust laws. Under antitrust law, substance, not form, controls. *See Copperweld Corp. v. Independence Tube Corp.*, 467 U.S. 752 (1984); *Simpson v. Union Oil Co.*, 377 U.S. 13, 24 (1964).

The relevant issue is not whether the hospital and its medical staff are or appear to be a single entity for purposes of conspiratorial capacity but whether the medical staff itself is a group of individual actors who compete with each other. This is illustrated by the leading case, *Weiss v. York Hospital*, 745 F.2d 786, 814-15 (3d Cir. 1984), *cert. denied*, 470 U.S. 1060 (1985). In *Weiss*, an osteopath brought an antitrust claim against a hospital and its medical staff for denying staff privileges to osteopaths.



On appellate review, the Third Circuit Court of Appeals agreed with the district court that the hospital cannot legally conspire with its medical staff (*id.* at 814-15). However, it reasoned that the medical staff itself was not a single entity for antitrust purposes but was instead a combination of doctors who were in competition with each other. The court explained its reasoning:

> Antitrust policy requires the courts to seek the economic substance of an arrangement, not merely its form. . . . The "substance" of an arrangement often depends on the economic incentive of the parties. The York medical staff is a group of doctors, all of whom practice medicine in their individual capacities, and each of whom is an independent economic entity in competition with other doctors in the York medical community. Each staff member, therefore, has an economic interest separate from and in many cases in competition with the interests of other medical staff members. Under these circumstances, the medical staff cannot be considered a single economic entity for purposes of antitrust analysis (*id.* at 814-17. *But See Cooper v. Forsyth County Hospital Authority, Inc.*, 789 F.2d 278, 281 n. 12 [4th Cir. 1986]).

While other cases have gone even further and held that a nonindependent medical staff can conspire not only with itself but also with its hospital, *see Bolt v. Halifax Hospital Medical Center*, 851 F.2d at 1273 (11th Cir. 1988), the key factor will continue to be whether staff physicians have separate economic interests *from each other*, not from the hospital.

Merely organizing for the purpose of seeking independent legal counsel should not as a matter of law alter a court's assessment of the underlying competitive dynamic among the hospital staff physicians. And

ironically, even if it did, it would support the conclusion that the physicians were one unit and thus incapable of conspiring among themselves.

In any event (and very significantly), an agreement, combination, or conspiracy among staff physicians cannot properly be inferred merely from their efforts to obtain joint and independent legal advice for the purpose of protecting themselves in future court proceedings. *See* M. Lewyn, "The Admissibility of Evidence Protected by Noerr-Pennington," ABA State Action and Noerr Gazette, vol. 1, issue 2 (1988); *Weit v. Continental Illinois National Bank & Trust Co.*, 641 F.2d 457 (7th Cir.), *cert. denied*, 455 U.S. 988 (1982). Although, arguably, the Noerr-Pennington immunity might not directly apply to retention of independent counsel where future court proceedings are not anticipated, hospital staffs should nevertheless be confident in retaining independent counsel for bona fide legal advice without risking exposure under antitrust laws. Indeed, such counsel may assist hospital staffs in avoiding situations where antitrust exposure might be applicable and, as previously discussed in this article, it is the substance of the conduct and not the form of any arrangement that ultimately controls for antitrust purposes.

Conclusion

In sum, while cooperation between hospital and medical staff reflects the norm, the threat of antitrust action where hospital staff seek to obtain legal counsel and advice is simply misplaced. Hospital staff physicians should feel free to seek independent counsel without undue fear of the antitrust laws. Proper counseling should allay the concerns of antitrust allegations and permit the medical staff to exercise its right to proper legal advice, which in the long run will act to strengthen the relationship between hospital and medical staff and to promote better health care services. Indeed, hospital staff should be encouraged to seek appropriate counsel whenever it is perceived to be suitable under the circumstances. Retention of legal counsel by organized medical staffs should be viewed as a positive action in the changing dynamics of hospital practice.

Triplicate Prescription: An Idea Whose Time Has Yet to Come

ANGELO J. TROISI, FACHE; NORBERT PICHA, FACHE; and GERARD E. EVANS, ESQ.

A coalition of Maryland state officials and agencies is considering the introduction of legislation that would enact a triplication prescription program, a concept that dates back almost a half century. To date, only eight states have adopted such legislation, and since 1964, at least sixteen other states have thoroughly examined the concept and rejected it.

The Maryland Medical and Chirurgical Faculty is on record as opposing the triplicate prescription initiative. Such programs have not demonstrated that they reduce prescription drug abuse, but instead, they limit access to necessary prescription pharmaceuticals, have a significant effect on patient pain management, and invade the confidentiality between physician and patient.

How "Triplicate" Works

Under triplicate prescription authority, all practitioners (MD, DO, DDS, DVM, DPM, and so on) who wish to prescribe any Schedule II pharmaceutical products must first register with the state. Once this is done, the following steps must take place:

- A state agency prints on "check-quality" paper triplicate sets of serially numbered prescription forms.
- Next, these forms are individualized by printing the practitioner's name, address, and registration numbers.
- The practitioner must, under law, use these triplicate forms whenever prescribing Schedule II products on an outpatient basis.
- Copy #3 of the set is maintained by the practitioner as a record.
- Copy #2 serves as record for the pharmacy that fills the prescription.
- Copy #1 is mailed to the state agency charged with monitoring the program. From Copy #1, the following information is entered into a centralized computer: practitioner's name, address, and registration numbers; the patient's name, age, and address, the product prescribed and amount prescribed; and the pharmacy's name and address.

Any prescribing over an arbitrary quantity by a practitioner will result in investigation of the practitioner by regulatory and law enforcement agencies.

Mr. Troisi is Executive Director, Mr. Picha is Deputy Executive Director, and Mr. Evans is General Counsel of Maryland's Medical and Chirurgical Faculty.

Finally, according to the proposed legislation, the Secretary of the Department of Health has the authority to add other controlled substances (Schedule III and IV) in the future.

Concerns About "Triplicate"

By targeting practitioners, triplicate prescription legislation assumes a significant degree of involvement by practitioners in drug abuse and drug diversion. While at best, this is a debatable concept, it ignores two basic realities: first, that physicians in this state do participate in the arena of drug prevention in a very significant way and have been working hand-in-hand with regulatory state and federal agencies. Second, targeting physicians can have serious implications in the practitioner's management of pain and can alter the decisions he/she should make for the best treatment of his/her patient. This premise ignores that even "worst-case" arguments cannot account for more than 1 to 4 percent of the total practitioner base ever being involved in any form of misuse of prescription products.

Proponents of triplicate simplistically argue that a reduction in the prescribing of Schedule II products will result in solving prescription abuse. There is no documentation of this. Instead statistical analyses of prescription drug abuse in states that have triplicate prescription program show no significant reduction in Schedule II drug abuse.

Triplicate prescription laws historically have led to explosive increases in use and possible misuse of Schedule III and Schedule IV products. According to the Texas Medicaid program, there was a greater increase in the prescribing of Schedule III products along with Schedule IV products after the triplicate was introduced.

Proposed legislation initially will affect only Schedule II products. Schedule II products represent a very small portion of the prescription drug abuse problem in Maryland; thus, the real target of drug abuse is not being addressed.

Some Schedule II pharmaceuticals are prescribed to manage very severe types of pain, such as cancer and postoperative pain. Historically, underprescribing of these products occurs whenever prescription routines are changed, leaving suffering patients as innocent victims of laws meant to punish others.

As with use of any centralized computer system, breaches in doctor-patient confidentiality are being

risked. According to the DEA, any health or law enforcement officer with access to the system's data will know a patient's name, age, address, the name of the physician and date of visit, the patient's medication, and medication schedule.

According to the DEA, several multiple copy states have reported that only 21 percent to 35 percent of the state's authorized prescribers ordered the prescription blanks or actually prescribed pharmaceuticals affected by triplicate. California reported that only 21 percent of their registered practitioners issued triplicate prescriptions for patients in 1982. A Rhode Island study showed that between February 1979 and June 1984 about 24 percent of their practitioners never reordered prescription blanks. Only 30 percent reordered once. Sixteen percent ordered once a year and only 2 percent more than twice a year.

In these states, what happens to those patients who actually need a Schedule II product if the physician they elect to visit does not possess the triplicate forms?

The DEA also states that thefts and break-ins of practitioners' offices after implementation of triplicate programs is not a problem. However, according to records from the Department of Justice of the State of California, 5,965 triplicate prescription forms were reported lost, stolen, or never received in 1987. In 1987, some 4,784 were reported stolen, lost, or never received. Triplicate prescription forms are reported have to have a street value ranging from $25 to $150. In Texas, it is reported that a single triplicate pad can be sold for $150.

Improper handling or reporting on the prescription forms may carry legal penalties for practitioners.

Alternatives to "Triplicate"

In 1980, the White House Conference on prescription Drug Abuse and Diversion examined these twin problems and called for a coordinated, comprehensive approach that would use existing data and would involve collaborative efforts of health professionals, professional regulatory boards, and law enforcement agencies.

Many states have since adopted solutions or programs, such as PADS or PADS II, which are supported by state practitioner groups and serve to identify practitioner offenders without risking the costs, duplications, potential breaches of doctor-patient confidentiality, and other which the triplicate prescription approach invites.

Several other states have conducted studies in prescription drug abuse and the feasibility of triplicate prescription programs. These studies were unable to determine the scope of abuse or the amount of abuse likely to be eradicated. In Georgia such a study determined that the first-year cost of a triplicate plan would be $702,000; that is almost three quarters of a million dollars!

To date, Maryland has **not** approached the drug abuse issue by convening a statewide effort involving those professional and public groups able to identify the impact of prescription drug diversion and the effects of any legislative plans to correct abuses.

Med-Chi is most willing to participate in a comprehensive, cost-effective effort to reduce diversion, an effort that would not restrict the normal, legitimate practitioner (and ultimately patient) access to vital, controlled prescription products. We hope other groups will join us in this effort.

Painful Prescriptions

These examples are excerpted from an article by C. Stratton Hill, Jr., MD, which appeared in the April 17, 1987 issue of JAMA.

Mary and her husband were looking forward to spending more time together since he had retired. At age 63, however, she developed esophageal cancer. Mary was referred to a cancer center in another city where she was treated with surgery and irradiation. After treatment she continued to have persistent mediastinal pain, which deprived her of sleep and depressed her appetite. Mary lost weight and was always tired and irritable; her daily living activities were a burden. Her family physician prescribed a mild narcotic-containing analgesic that didn't help. On the next visit to the cancer center, a strong narcotic was prescribed that provided adequate relief. Mary slept and ate better and enjoyed life again. When her supply of the narcotic was gone, she requested a prescription refill from her family physician; he refused. He explained that he didn't have the triplicate forms required by state law to prescribe schedule II narcotics, nor did he ever intend to obtain any. He believed that none of his patients needed drugs with an addictive potential. When she again lost weight and sleep because of pain, Mary's husband drove the 225 miles to the cancer center for the effective medication. After several months her pain went away.

Sixty-five year old Bill had recently retired as postmaster of his Midwestern hometown. He continued to be a substantial citizen of his community, despite his diagnosis of rectal cancer. Its recurrence caused severe pelvic pain. Bill was referred to a cancer center where he received chemotherapy and radiation. For pain he was treated with 90 mg of controlled-release oral morphine taken every 12 hours, and adequate relief was achieved, but the pain's intensity increased; eventually 240 mg every 12 hours was required. Bill returned home after his first course of chemotherapy, but soon his supply of morphine was exhausted. He asked his longtime family physician to prescribe more but was told it was impossible for what Bill understood to be "legal reasons." Bill's wife drove him more than 1,000 miles to the cancer center while he suffered excruciating, unbearable pain.

Bonnie's cancer was advanced, and she was under hospice care. Her oncologist treated her pain by delivering morphine intravenously via a portable, programmable infusion pump. The pump and medication were supplied by a home-care service independent of the hospice. The pump held several day's supply of morphine. On her next visit the hospice nurse observed the pump and became concerned about "this much" morphine being in the home. She felt the pump morphine was an enticement for criminal behavior and called the county sheriff. He contacted the oncologist who, wanting to avoid a legal entanglement, ordered the pump discontinued and the resumption of oral and intramuscular narcotics.

I was involved in Mary and Bill's care and became aware of Bonnie's plight through other sources. Most, if not all, physicians are compassionate and want to relieve their patient's pain and suffering. However, some physicians seem to have problems prescribing narcotics for three possible reasons.

First, there is poor understanding of what euphoria and mood elevation actually are: a patient who is pleased because his or her pain is gone is not necessarily euphoric. Second, a patient who needs narcotics at regular, scheduled intervals is not an addict. Requiring a patient with established, chronic pain to ask repeatedly for relief is degrading and dehumanizing. Finally, even if occasional euphoria occurs in some patients, it does not destroy all their previous values or dominate their lives against their wishes and control. A stable individual will probably continue to be stable, free of dependence or addiction, after his or her encounter with narcotics for the relief of pain.

Drug abuse is a prodigious problem in our society, and it is getting worse. The physician is a prime supply target for the drug abuser. The drug seeker with convincing but false symptoms of pain is a real challenge to the practitioner. However, it is preferable for a physician to be occasionally duped than to deny adequate relief to the patient with real pain.

Narcotics are a blessing to our society when used properly. Many myths and misconceptions surrounding their use seem to be perpetuated in the current medical school curriculum. Physicians should reeducate themselves about the proper use of narcotics for pain control and not allow a concern about abuse potential to prejudice professional judgment. The physician has a duty to relieve a patient's pain and suffering, a notion first articulated by Hippocrates.

MED-CHI'S 191st ANNUAL MEETING

April 12-14, 1989
Turf Valley Hotel and Country Club, Ellicott City, Maryland

WEDNESDAY, APRIL 12, 1989

2:00 p.m. Plenary Session - Congressman Tom McMillen

THURSDAY, APRIL 13, 1989

"The Long Term Management of the COPD Patient" - Lewis J. Rubin, M.D., Head, Pulmonary Division, University of Maryland School of Medicine, sponsored by the Maryland Thoracic Society

"Pulmonary Rehabilition" - Edward W. Schaefer, M.D., Chief, Pulmonary Medicine, Liberty Medical Center and Bernard Farrell, M.D., President, Medical Staff, Howard County General Hospital, sponsored by the Maryland Thoracic Society

"Cardiopulmonary Resuscitation - Every Patient's Right - Or Exercise In Futility?" - Speakers To Be Announced, sponsored by the Med Chi Professional Ethics Committee and the Committee on Medicine and Religion

"Are Arterial Blood Gases Obsolete: Reflections On The Evolution Of Patient Monitoring" - John W. Severinghaus, M.D., Professor Of Anesthesiology, Anesthesia Research Center, San Francisco, sponsored by the Maryland Society of Anesthesiologists and the Baltimore Critical Care Society

"Treating The Musicians Among Your Patients" - Richard Lederman, M.D., Ph.D, Director, Medical Center For Performing Artists, Cleveland Clinic Foundation, Cleveland sponsored by the Med Chi Music Medicine Clearinghouse

"The Pen Is Mightier Than The Sword - Prescription Drug Abuse" - Nelson H. Hendler, M.D., Clinical Director, Mensana Clinic, Stevenson sponsored by the Med Chi Committee On Alcoholism and Clinical Dependency, Maryland Academy of Family Physicians, and the Maryland Psychiatric Society

"The Primary Care Physician's Role In The Management Of Acute Coronary Disease" - Henry Meilman, M.D., Union Memorial Hospital, Baltimore and Carl L. Tommaso, M.D., University of Maryland, Baltimore sponsored by the Maryland Academy of Family Physicians

FRIDAY, APRIL 14, 1989

"Coping With Stress In The Physician's Family" - Penelope Ziegler, M.D., Medical Director, Bethany Center, Bethany, Pennsylvania sponsored by the Med Chi Committee On Physician Rehabilitation

"Reanimation Of The Paralyzed Face" - Mark May, M.D., Clinical Professor, Department of Otolaryngology Head and Neck Surgery, University of Pittsburgh School of Medicine sponsored by the Maryland Society of Otolaryngology Head and Neck Surgery

Analysis of an Incompetence Case

ROBERT L. ROTH, ESQUIRE

In recent months various Maryland health occupational boards have come under fire for their response to complaints against particular licensees. While this criticism may or may not be justified, the issue of how to proceed against incompetent licensees is a common problem nationwide. In Maryland's explosion of cases involving malpractice, far more licensees are disciplined for offenses relating to drugs or sex than for incompetence. An approach to make the boards more responsive to the problem of the incompetent licensee is presented.

Courts in numerous jurisdictions have wrestled with the issue of incompetence in recent years and there is a growing body of law in the area. The scope of this article is limited to health professionals. As one may imagine, most of the cases involve dentists and physicians. Notwithstanding the narrowness of the case law, the methodology presented herein should be applicable to any licensed professional.

In this article some common words are used in special ways. The word "acts" is used to include both acts and omissions. The word "incompetence" includes what is also known as "professional incompetence," but it does not include physical or mental incompetence. Finally, the term "disciplinary authority" is used to refer to the unit responsible for disciplining licensees.

Implied in each Maryland health occupational licensing act, although never expressed, is the expectation that licensees will be competent. Competence is implied from the provisions of each act that authorizes the disciplinary authority to discipline licensees who are incompetent. Just as the expectation of competence is not expressed in the law, the law does not provide a definition for incompetence.

The licensing acts generally have five qualifications that must be met before a licensing board will issue a license to an applicant: age, education, examination, experience, and moral character. By adopting age and moral character qualifications, the Legislature would seem to be trying to assure that licensees have reached an age of legal responsibility and that the licensee is deserving of the state's trust. While both age and moral character are essential for licensure, they do not necessarily imply a licensee is competent.

The other three qualifications (education, examination, and experience) seem to relate directly to the competence of the licensee. Of these, education and experience are the crux of what makes a licensee competent. The examination requirement serves as a method for the board to assess education and experience. It can be inferred from the education and experience qualifications that a competent licensee must have a certain amount of knowledge and must have demonstrated the skill required to apply the knowledge to patients.

There is another expectation of licensees, not derived from the licensing law but inferred from laws relating to negligence. By providing a remedy against licensees who cause injury by lack of due care, the law implies the expectation that the licensee will use due care or diligence when practicing under a license.

Accordingly, when trying to understand what constitutes the competent practice of a profession, a good place to start may be the "diligent application of the knowledge and skill necessary to practice the occupation for which the individual is licensed." Incompetence would then be the lack of knowledge or skill necessary for the proper practice of the profession.* This is the definition used in this article. *(Chastek v. Anderson*, 416 NE.2d 24 [Ill. 1981]. Compare, *Dental Examiners v. Brown*, 448 A.2d 881 (ME 1982) and *Pollak v. Kinder*, 85 Cal. App. 3d 833 (1978).)

Incompetence vs. Negligence

In general, each act of incompetence is an act of negligence, but each act of negligence is not an act of incompetence. The negligence standard is based on the identification of a duty and finding a breach of the duty. In matters involving professional licensees, the duty is conceived as the obligation to practice the profession in accordance with the standards for the community in which the professional practices. A breach of the duty is any act that falls below the community standard. Accordingly, the negligence universe contains any act that falls below community standards for the practice of the profession.**

Courts have identified two distinct divisions within the negligence universe. The first division is negligent acts

Mr. Roth, a former Maryland Assistant Attorney General who prosecuted cases before the Commission on Medical Disciplinar, is an attorney with the Health Care Financing Administration. The views presented here are exclusively those of the author and do not represent the views of any public or private entity.

*It is interesting to note that licensees who persistently fail to use due care or diligence are disciplined, not for being incompetent, but for "unprofessional conduct."

**Specialization can affect the expectation of competence. An individual who specializes is expected to have more knowledge and skill in a particular area and will be held to the higher standard of the specializing community (*see Board of Dental Examiners v. Brown*, 448 A.2d 881 [Me 1982]). As a result, an individual who claims to be a specialist could be found to be incompetent even though the individual has the knowledge and skill of the nonspecializing or general licensee.

caused by carelessness or a want of due care (*see, Pollak v. Kinder*, 85 Cal. App. 3d 833 (1978) ["remissness"]). The second division is noncareless (diligent) acts that demonstrate a lack of knowledge or skill, i.e., acts of incompetence.

The distinction between these divisions is essential to understanding how the courts have viewed negligent acts. Careless acts are not incompetent acts, therefore multiple careless acts should not be used to justify a charge of incompetence (*see, Chastek v. Anderson*, 416 NE2d 241 [Ill. 1981]). Repetitive careless acts have been used to warrant a charge of unprofessional conduct (*Id.*).

Incompetent Acts vs. Incompetence

For the purposes of this article, it is important to distinguish between an incompetent act and incompetence. An incompetent act is any noncareless act that is caused by the licensee's lack of the knowledge or the skill necessary for the practice of the profession (*see Pollak v. Kinder*). Incompetence is a conclusion made by a disciplinary authority based on a finding of one or more incompetent acts. (*Id.*).

While experts may disagree about whether an act is properly characterized as an incompetent act, the disciplinary authority will decide whether the act was an incompetent act. Having made that decision, the far more difficult duty of the disciplinary authority is to determine whether the act or acts are sufficient to support a conclusion that the licensee is incompetent. The determination of whether an act is an incompetent act is properly a decision for a panel of experts (for example, peer review). However, it is the duty of the disciplinary authority alone to determine whether the act or acts presented warrant discipline based on professional incompetence.

Once the determination has been made that a licensee's negligent acts were diligent acts demonstrating a lack of knowledge and skill, the next step is to determine whether the acts justify a charge of incompetence. Cases in which the courts have agreed with disciplinary authorities on a finding of competence seem to fit into these four groups: single acts, pattern of same act on several patients, several acts on one patient, and several acts on several patients.

Using a single act of incompetence to justify a finding of professional incompetence is not without precedent (*see, Blanchard v. Michigan State Board of Examiners in Optometry,* 40 Mich. App. 320 (1972); *Rosi v. Alaska State Medical Board*, 665 P.2d 28 [Alaska 1983]). It would be fair to say this finding is rare and courts go out of their way to avoid having to make this finding (*see, Kearl v. California Board of Medical Quality Assurance*, 189 Cal. App. 3d 1040 [1986]). In *Kearl*, the court wrestled with the issue of single act incompetence but resolved the case by finding several acts within a single event.

The major issue in single act incompetence cases is the type of sanction that is to be imposed. In *Blanchard,* the Board used the single act to justify a six-month suspension. The courts have agreed with the finding of professional incompetence based on a single act when the sanction is appropriate. The cases in which the courts have supported a single act as a basis for a conclusion of incompetence have been so outrageous as to require extraordinary action (*see, Gibson v. Connecticut Medical Examining Board*, 104 A.2d 890 (1954) where a physician who failed to order tests to confirm diagnosis had a financial interest in the estate of a patient; and *Rosi*, above, where a physician delayed hospitalization for a patient in need of immediate hospitalization).

The "pattern," or the same incompetent act performed on several patients, relies on multiple incompetent acts as a basis for a finding of incompetence. Use of multiple acts is far more typical than single acts in justifying a finding of incompetence. A leading pattern case is *Board of Dental Examiners v. Brown*, 448 A.2d 881 (Me 1982)). This Maine case affirmed a lower court ruling upholding the decision of the board to revoke Dr. Brown's license to practice dentistry (*see also, Gattner v. Whalen*, 419 N.Y.S. 2d 205 [1979]).

Balancing the Sanction

The major issue in pattern cases is the balancing of the incompetence with the sanction. The pattern case occurs when a professional constantly performs the same procedure inadequately. Appropriate sanctions could range from revocation to a license limitation prohibiting the performance of certain acts and imposing education requirements, *Id.*

A licensee's performance of several incompetent acts on one patient has been used as an alternative to finding incompetence based on a single act. In this type of case the disciplinary authority usually will look at a single extreme case (and probably a high malpractice award) and break it into several acts or judgments(see *Kearl*, above). The authority will then aggregate the acts or judgments into a conclusion to support the sanction desired, *Id.*

In using this ground to justify a conclusion of incompetence, the disciplinary authorities often have imposed the sanction of revocation. This type of case has been used when an event has happened that the authority thinks never should have happened and never should happen again. The event should shock the conscience and the acts should show lack of fundamental knowledge and skill.

The prototypical incompetence case often includes several acts on several patients with no apparent pattern and often is used to justify a revocation with no time limitation. This type of case is used for the professional who, in more than one case and in more than one way, has demonstrated a lack of fundamental knowledge or skill. A leading case in this area is *Department of Human Services v. Earle,* 481 A.2d 175 (Me. 1984). Earle was licensed as an emergency medical technician. The licensee neglected to perform two basic functions. Earle's license was revoked.

Issues for Disciplinary Authority

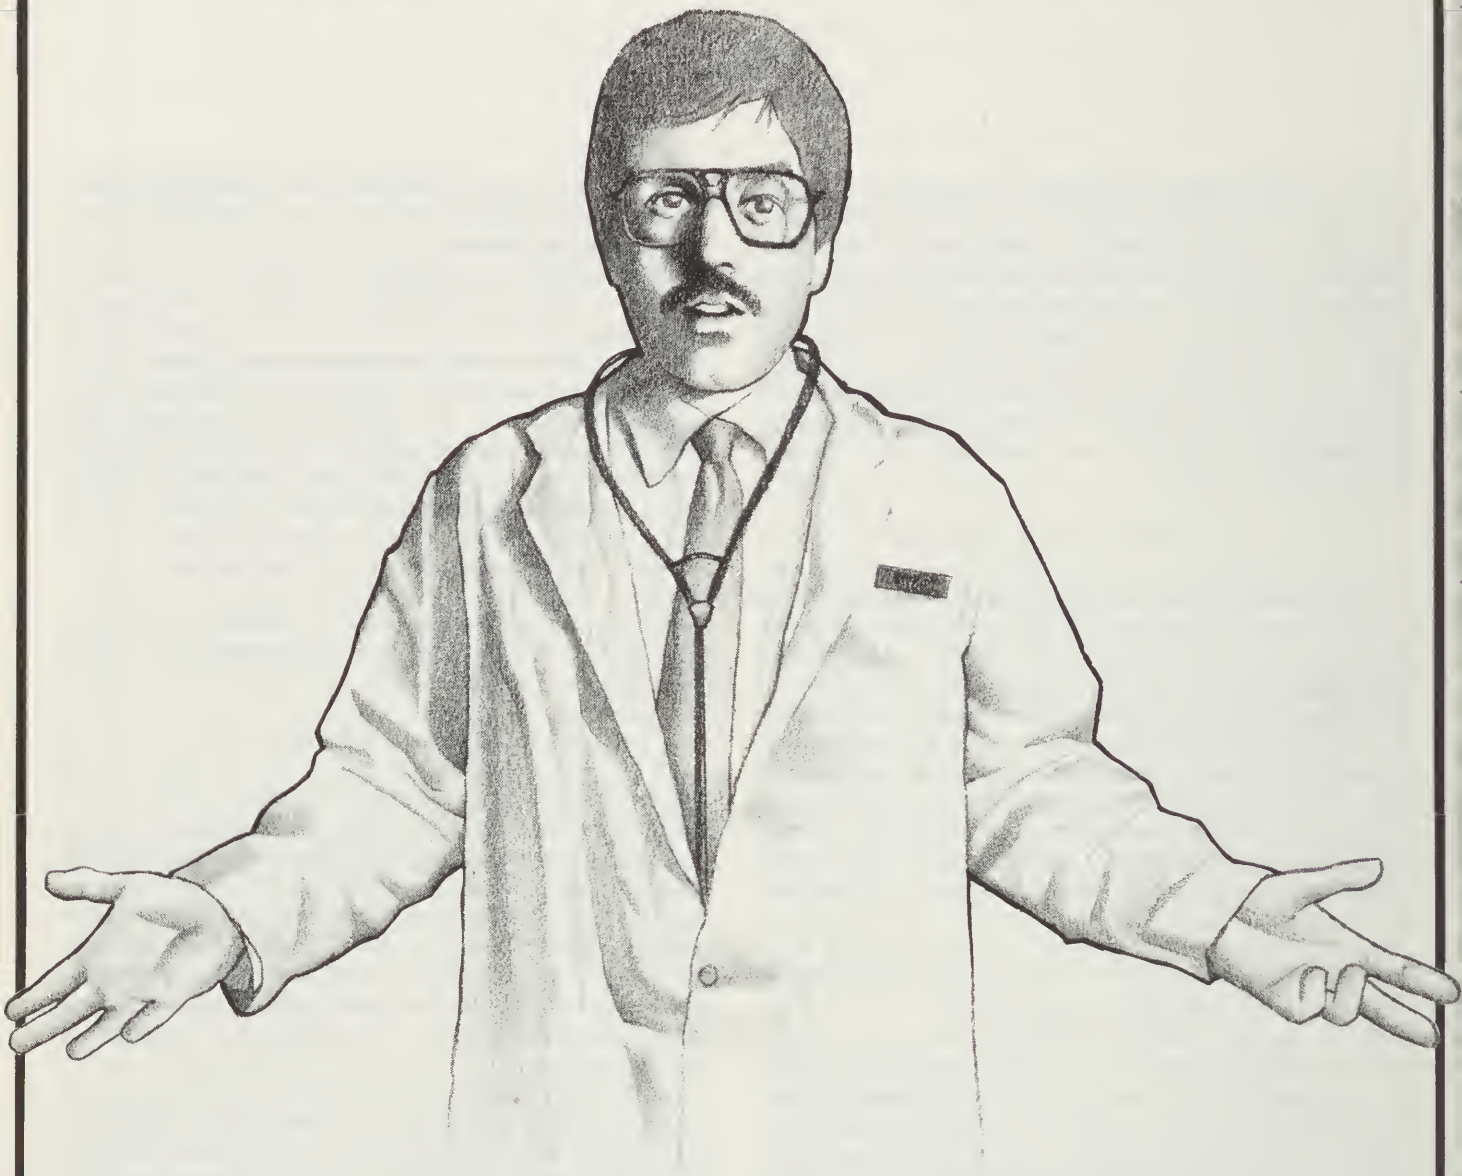
After the disciplinary authority has identified an act of incompetence, the authority ought to consider following several steps: identify the incompetent acts; determine what type of incompetence case the facts present; determine what sanction would be appropriate under the facts; discuss with counsel whether the facts, if proved, could justify the sanction sought; and discuss with counsel the proper foundation necessary for the preparation of the case. An incompetence case will require a board of experts (practitioners) to provide opinions that the acts of the licensee were below the community standard.

An important policy issue for the authority to consider is timing. The types of incompetence cases above include actions based on a single act. The authority ought to consider whether to charge based on a single act. As previously stated, a single act might not justify the same sanction (revocation) as would a multiple act case. However in some cases the authority might wish to act expeditiously to try to prevent future incompetent acts by a licensee in which the authority has no confidence (*see, Rosi v. Alaska State Medical Board*, above, where the practice was limited).

In these types of cases the authority could act immediately and privately by reviewing the licensee's practice. This serves a threefold purpose: it puts the licensee on notice that the authority is paying attention to the licensee's practice, the authority would be acting diligently, and such review would help build the case against the licensee that ultimately could be used to justify a harsher sanction.

Another issue the disciplinary authority may wish to consider is which sanction is most useful in response to the incompetence case presented. It is common for the authorities to consider the incompetence case to be the major ground on which to justify the revocation of a license. Because of this thinking, the authority will spend years collecting material on case after case with bad results -- all to justify litigation resulting in revocation. There are problems with this approach. While collecting cases, earlier ones become stale and remote. In addition, there is something singularly disconcerting about an authority waiting for a licensee to perform another incompetent act; this approach seems to be inconsistent with the authority's duty to protect the public.

Proposed Solution



A possible solution would be for the authority to no longer view the incompetence case as a revocation case (*see, Rosi*, above). The authority, once it determines that a licensee has acted incompetently, should begin to monitor the situation immediately and commence peer reviews. While it may turn out that incompetent acts will lead to revocation, the authority loses nothing by beginning to address the incompetent professional as soon as the authority has knowledge of a single act of incompetence.

In analyzing how the courts have responded to incompetence cases in providing a methodology for addressing incompetence cases and in raising some issues for the disciplinary authorities to consider, I cannot help thinking that the incompetence charge has been neglected as a tool for the ongoing task of addressing routine quality issues concerning our health professionals. I hope this article provides some insight into how an authority can use the incompetence case as the everyday justification to protect health care consumers in Maryland.

State Regulation of Physician Dispensing

JEFFREY I. ZUCKERMAN

The Federal Trade Commission's Bureaus of Competition, Consumer Protection, and Economics are pleased to respond to the request of the Maryland State Board of Medical Examiners for our views regarding the practice and regulation of the dispensing of prescription drugs by physicians.[1] We understand the Board is considering regulations to implement recent legislation regarding physician dispensing (Chapter 691 of the Acts of Maryland, 1986, approved May 27, 1986, effective January 1, 1987). We believe dispensing by physicians and other health care practitioners increases service and price competition among practitioners and between practitioners and pharmacists to the benefit of consumers. We urge the Board to preserve and encourage such competition in any rules and regulations it may adopt concerning the dispensing of prescription drugs by physicians.

Physician Dispensing

The dispensing of medication by physicians is a traditional part of medical practice. Until about 30 years ago, the family physician who made house calls and dispensed medication was a familiar figure. Today, most consumers receive a prescription order from their physician and purchase the prescribed drugs from a pharmacist. Other consumers, often but not exclusively located in rural areas not served by a nearby pharmacy, still purchase medication from their physician. And as competition among physicians has increased in recent years, more physicians have begun offering their patients the convenience of dispensing prescription drugs.

Dispensing by physicians benefits consumers by maximizing the number of qualified sources from which they may purchase prescription drugs, and by enabling consumers to avoid making a separate trip to a pharmacy. The competition resulting from dispensing by physicians may enhance the incentive for pharmacists to offer lower prices and additional services to consumers.

Opponents of physician dispensing allege that it may injure consumers by encouraging physicians to overprescribe or to limit product selection to those drugs available in the physician's office in order to increase revenues. In our view, the physician's desire to maintain a reputation for integrity should reduce such temptations. Even assuming that such incentives exist, restraining an entire category of transactions by physicians is not justified. The fact that some pharmacists may recommend the purchase of vitamins or over-the-counter medications because of their high retail margins does not justify a restraint on the selling of such items by pharmacists. The incentive to abuse dispensing authority for economic gain appears to be no greater than the inducement to overuse any other services offered to patients including, for example, follow-up visits, in-house laboratory testing, or diagnostic imaging. If inappropriate dispensing occurs, it may be dealt with by less restrictive means, such as peer review and law enforcement.[2]

Opponents also argue that physician dispensing eliminates the system of checks and balances by which pharmacists review prescriptions for errors, possible allergic reactions, or potential adverse interactions with other prescription or over-the-counter drugs the consumer may be using. In practice, of course, pharmacists frequently do not conduct such reviews. Moreover, if physician dispensing eliminates the opportunity for pharmacists to "check" for physician prescribing errors, the elimination of medication errors that occur because of miscommunications between physicians and pharmacists (such as misinterpretations of written prescriptions) may be a significant benefit. None of the arguments against dispensing of prescription drugs by physicians presents a compelling case for depriving consumers of the benefits of service and price competition likely to result.

Regulation of Physician Dispensing in Maryland

Physician dispensing has long been permitted by federal and most state laws.[3] In Maryland, physicians have not been prohibited from personally preparing and dispensing prescription drugs.[4] The amendments recently enacted by the Maryland legislature require physicians to apply to the State Board of Medical Examiners, demonstrate to the Board's satisfaction that such dispensing is in the public interest, and obtain the Board's written approval to dispense. In addition, the amendments limit physicians to dispense only to their own patients, require that dispensing physicians not have a substantial financial interest in a pharmacy, and require that dispensing physicians meet certain labeling and record-keeping requirements. The amendments authorize the Board, after consulting with the State Board of Pharmacy, to adopt rules and regulations regarding the dispensing of prescription drugs by licensed physicians.

The statutory requirement that a physician applying for permission to dispense must meet a public interest standard requires the Board to determine what burden of proof will meet this standard. The legislature

Mr. Zuckerman is Director of Bureau of Competition, US Federal Trade Commission. This article is an edited version from the AMA *State Health Legislation Report*, Vol. 15, No. 3 (August 1987) pp. 1-4. (The FTC also has addressed the subject of physician dispensing in two letters to the Georgia Pharmacy Board.)

declined to impose restrictive conditions on applicants. As originally introduced, Senate Bill 830 was hostile to physician dispensing. It contained a preamble purporting to set forth as state policy that (1) dispensing by physicians and certain other health care practitioners should be discouraged if adequate pharmaceutical service is available, (2) such practitioners should derive their income solely from the sale of their professional services, and (3) dispensing by such practitioners should be limited, absent exceptional circumstances, to starter doses. The bill would have required physicians seeking to dispense to demonstrate for the Board that there was a "need" for such dispensing, that adequate pharmaceutical services were unavailable, or that "exceptional circumstances" warranted such dispensing. The legislature considered and rejected all those provisions and required only that the Board find that approval of a physician's application to dispense is in the public interest.

We do not believe the public interest is served by restrictions on physician dispensing designed to protect the economic interests of specific groups or individuals. We recommend strongly that the Board not require a demonstration of "need" for physician dispensing, of "unavailability" of pharmacies, or of "exceptional circumstances." The public interest will be best served by maximizing the number of qualified sources from which consumers may purchase prescription drugs. As discussed above, this will increase consumer choice and enhance the incentive of sellers of prescription drugs to offer lower prices and a wider range of services.

To minimize regulatory impediments to physician dispensing, we suggest that the Board adopt a presumption that, in general, physician dispensing is in the public interest. Such a presumption should operate to permit the routine and expeditious approval of applications, except where the Board believes that there is evidence to rebut the presumption in the case of a particular physician. Applicants should not be required to meet burdensome standards of proof that might impose unnecessary costs or delays, and thus deter physicians from seeking approval.

Conclusion

The Federal Trade Commission actively encourages competition in the health care sector to promote lower prices, higher quality, and an increased variety of available services. Physician dispensing increases competition among physicians, and between physicians and pharmacists, thereby benefiting consumers. We believe the Board would best serve the public interest by seeking to facilitate and encourage physician dispensing in any regulations it may adopt.

"We Do It With A Touch Of Class"

A PRIMER ON TORT LAW

THEODORE F. HAAS
SCHOOL OF LAW
UNIVERSITY OF NORTH CAROLINA

Reprinted by the Medical and Chirurgical Faculty of Maryland

For permission to reprint Professor Haas's Primer, the Medical and Chirurgical Faculty of Maryland is grateful to the North Carolina State Goals and Policy Board, its Chairman Governor James G. Martin, and especially its Vice-Chairman Hamilton C. Horton, who saw the need to make the law of torts accessible to the many non-lawyers who are interested in it.

PREFACE

The various legislators, journalists, citizen groups and governmental commissions who have been charged with the task of considering tort reform have lamented the lack of a simple, non-biased and historically based exposition of what tort law is, and how it got to be.

That is the sole purpose of this primer.

We have attempted here to lay out in layman's terms the basic concepts--the vocabulary, if you will--of tort law as it has developed in this country, have given the traditional rationale for it, and have made an effort to explain how the English system and the civil law systems address these same problems of civil wrongs we Americans encounter.

No attempt is made here to argue pro or con. Nor does this primer profess to provide more than a basic understanding. If, however, it assists in ensuring that debate over tort reform is informed by an understanding of how our own system has evolved, and how other Western systems have addressed the same problems, it will have served its modest purpose.

North Carolina State Goals and Policy Board

"Perhaps more than any other branch of the law, the law of tort is a battleground of social theory ...[The] process of 'balancing the interests' is by no means peculiar to the law of torts, but it has been carried to its greatest lengths and have received its most general conscious recognition in this field. The process is not a simple one, and the problems which arise are complex, and seldom easy of solution ....Ultimately the law must coincide with public opinion, and cannot stand against it; but when that opinion is in a state of division and flux, it is not surprising that the courts' decisions reflect the battle which is raging about them."

--William Prosser, The Law of Torts 14-16 (4th ed. 1971)

I. THE TORT ACTION: AN OVERVIEW

The tort action can be defined as follows:

--a lawsuit based on a claim by the person bringing the lawsuit (the plaintiff)
--that he was injured by the person against whom the lawsuit is brought (the defendant)
--and that the way in which that injury came about is such that the defendant should be held liable to the plaintiff, that is, should compensate him for the monetary value of his injury.

The word "tort" means "fault", and in general tort law imposes liability only when the injurer is at fault. For example, if Adams suffers a sudden and unexpected heart attack while driving and loses control of the car, which strikes the pedestrian Jefferson, Adams will not be liable to Jefferson. Adams will not be liable because he was not at fault in driving his car. It is true that he injured Jefferson, and Jefferson's injury is not one whit less severe because Adams was not at fault; nevertheless, Adams is not liable to Jefferson because Adams was not at fault.[1] There are exceptions to the general rule that tort liability requires fault, but we shall postpone our discussion of them.

A. Tort Law Distinguished from Criminal Law and Contract Law

Tort law differs from criminal law in that in tort law a private individual prosecutes the lawsuit rather than a government official. Government provides the courtroom, the judge, the jury (if one of parties wants one) and the law under which the case is decided. It is up to the plaintiff, however, to hire an attorney and to develop the facts that will prove his case. The plaintiff does not have to prove his case beyond a reasonable doubt; it is enough that he satisfies the jury that it is more probable than not the defendant injured him in a way that entitles him to compensation.

Tort law differs from contract law in that it does not depend on the parties having agreed to anything. For example, Fillmore cannot successfully sue Tyler for Tyler's failure to provide him with a partridge in a pear tree unless Tyler and Fillmore had entered into a contract whereby Tyler promised to provide Fillmore with these things. In contrast, if Tyler's failure to watch the road while he is driving results in injury to his passenger Fillmore, Fillmore can successfully sue Tyler in tort for the injuries Fillmore sustained regardless of whether Tyler had ever agreed to watch the road while driving. Tyler has violated a duty imposed by the state--careful driving--rather than one imposed by agreement between the parties.

B. The Goals of Tort Law

Tort law has three basic goals. The first is the resolution of private disputes. In order to vindicate a victim's rights and to channel his impulse for personal vengeance, the state provides a process and a set of rules under which a victim can obtain justice. Thus tort law helps keep the peace.[2] There are classic tort cases in which the loss sustained by the victim is negligible or nonexistent, yet he has a real grievance. A case that almost all law students study in their first year was decided in the year 1348.[3] The defendant wanted to buy wine after the tavern was closed. He beat on the door of the tavern with a hatchet that he had in his hand. When the tavernkeeper's wife put her head out of the window and told him to stop, he swung the hatchet at her but did not hit her. Despite not being struck, she was held to have a cause of action against him. Money was not really at stake--she was awarded nominal damages--what was at stake was vindication of her right not to be assaulted.

The second goal of tort law is compensation. A society has several options regarding the victims of accidents.

It can choose simply to let the loss lie where it falls--the victim and his family are left to cope with the injury as best they can.[4]

Or it can provide mechanisms whereby persons can insure themselves against loss.[5]

Or it can provide a government-administered safety net for poor persons whether the cause of their poverty is accidental injury or something else.[6]

Or it can require, through its tort law, that those who injure others compensate them.[7]

Tort law does not require that every accident victim be compensated but provides that in a limited set of circumstances victims should be compensated by their injurers. What that limited set of circumstances is will be developed below. For now, let us assume that we have such a case--for example, Adams negligently runs down and injures Jefferson, who is properly crossing the street. Adams is required "to make the victim whole"--to restore Jefferson to the position he was in prior to the injury.[8] Adams must pay for the medical expenses, the lost earning capacity and for the pain and suffering Jefferson experiences because of Adams' negligence.

Traditionally, tort law was the only means by which victims were compensated for their injuries and diseases. Otherwise the victim and his family were left to bear the loss alone. Insurance, public and private, against personal injury is a fairly recent development.[9] But with the widespread availability of public and private insurance, the question may now be asked whether tort liability is the most effective means of compensating victims. In this regard, it is interesting that New Zealand has generally abolished tort liability, and victims are compensated through public insurance.[10]

A third goal of tort law is accident prevention. If people are required to compensate those they injure, they will have the incentive to take safety precautions in order to avoid such liability and this, in turn, will reduce the number of accidents.[11] For example, Hayes operates a baseball park with a 10-foot fence. While walking on a street beside the park, Tilden is struck by a foul ball from the park and seriously injured. If Hayes is required to compensate Tilden for his injuries, Hayes will have an incentive to increase the height of his fence in order to avoid the recurrence of such liability. If the extent of such prospective liability can reasonably be estimated at $10,000 and the cost of the additional fencing to prevent such injuries at $8,000, it is reasonable for Hayes to install the additional fencing. If, on the other hand, a reasonable estimate of future liability is $2,000, and the cost of preventive fencing is $8,000, such preventive measures are not worth taking, certainly from Hayes' point of view.

The three goals of dispute resolution, compensation, and accident prevention generally reinforce one another, but all three are not necessarily present in a given case. For example, a victim whose insurance covers his injury-related costs still has a tort action against the injurer. The compensation goal is not significant in this case, but the dispute resolution and accident prevention goals are.

C. The Tort Action's Five Basic Questions

A tort action involves five basic questions. The first question is whether the defendant is liable to the plaintiff at all, that is, whether the defendant must provide any compensation to the plaintiff. The second question deals with the monetary value of the plaintiff's injury. The third question deals with the apportionment of compensation. Should a defendant who has been found liable be required to pay for the entire amount of plaintiff's damages? The fourth question deals with punitive damages. Should a defendant be required to pay an amount of money not in order to compensate the plaintiff for his injury but in order to punish the defendant for especially wrongful behavior? The fifth question deals with the costs of the lawsuit itself. Who should pay these costs, in particular the legal fees? More broadly, is the traditional lawsuit too expensive? I shall take up each of these questions in turn.

II. IS THE DEFENDANT LIABLE?

In order for a defendant to be found liable in a tort action, the plaintiff must prove:

(1) that the defendant owed him a duty;

(2) that the defendant breached that duty;

(3) that the defendant's breach of that duty injured the plaintiff; and

(4) that the injury resulted in damage to the plaintiff.

The defendant defends by attempting to disprove any or all of these points. In addition, the defendant has various other defenses. He may prove:

(1) that the plaintiff agreed to accept the risk that the defendant would negligently injure him (Assumption of Risk);

(2) that the plaintiff's own negligence contributed to the plaintiff's injury (Contributory Negligence); and

(3) that the defendant is immune from tort liability, either in general or to this particular plaintiff.

A. Elements To Be Proved by the Plaintiff

(1) Duty. The first requirement of tort liability is that the defendant owe a duty to the plaintiff. In the usual case--whether it be professional malpractice, a driving accident, or a malfunctioning product--this requirement is unproblematic. But there are certainly cases in which the courts have held that the defendant did not owe the plaintiff a duty even when the defendant's action or inaction injured the plaintiff. For example. Pierce rents a canoe to Buchanan for use on Pleasure Lake. While paddling about, Buchanan tips the canoe over. He hangs onto the side of the canoe for half an hour continually shouting for help. Pierce hears Buchanan's shouts knows that he is in distress, but does nothing. After half an hour, Buchanan is unable to hold onto the canoe and drowns. Pierce is not liable to Buchanan because he has no duty enforceable under tort law to rescue him.[13] Although many people would find Pierce's behavior reprehensible, tort law generally does not impose a duty on a person to come to the aid of another.

Even when one person does owe another a duty, the nature of that duty remains to be decided. Consider, for example, the facts of a classic tort case: Kendall and Brown are out walking their dogs when the dogs get into a fight. Kendall attempts to separate the dogs with a stick. In the course of this operation, as he raises the stick over his head, he strikes Brown in the eye.[14]

Was Kendall s duty not to hit Brown intentionally? not to hit him carelessly? not to hit him at all?

If the nature of Kendall's duty to Brown was to refrain from hitting him intentionally, then Kendall did not fall short of his obligation--he did not breach his duty. Kendall was raising the stick in order to hit the dogs, not in order to hit Brown. If, on the other hand, Kendall's duty was to refrain from striking Brown at all, then Kendall did breach his duty. Or the extent of Kendall's duty may have been something in between these two. The mere striking of Brown may not have been a breach of his duty, but if the striking was careless or negligent--even if it was unintentional--that may have been a breach of Kendall's duty to Brown.

Brown v. Kendall, which was decided by the Supreme Judicial Court of Massachusetts in the mid-nineteenth century, is a significant case because it changed the nature of duty one person owed another.[15] Prior to Brown v. Kendall, the rule was that when one person hit another, he was liable for any injury he caused. This was a rule of "strict liability."[16] Brown v. Kendall states that an injurer is liable only if he is negligent. Nor was the

rule of Brown v. Kendall confined to dog-fight cases. It was applied to the whole host of injuries that had been ushered in with the high-speed, massive machinery of the industrial age.[17]

But the negligence was not a universal requirement. The courts held that in certain kinds of cases, those in which the defendant's activity was "ultrahazardous" or "abnormally dangerous," the defendant would be strictly liable for injuries caused by his activity.[18] Recall the earlier example of Adams' heart attack while driving. He was not liable to Jefferson because he was not at fault. However, if Adams had been driving a tank truck full of gasoline when he suffered his heart attack, and the truck had ruptured and spilled gasoline over the road and the gasoline had caught fire and injured or killed Jefferson, liability would be imposed on Adams despite his being free from fault.[19] That is because the transportation of large amounts of flammable material is an activity that the law considers to be so ultrahazardous or abnormally dangerous that liability is imposed without fault.[20]

One of the major developments of tort law in the last quarter century was the extension of strict liability to injurious products. Many states, not including North Carolina, hold a manufacturer liable for injuries caused by its products if the products are defective and unreasonably dangerous whether or not the manufacturer was negligent.[21] It must be said, however, that the requirements of defect and unreasonable dangerousness have made this branch of strict liability resemble negligence more than do some other branches, such as abnormally dangerous activities and workers compensation.[22]

(2) Breach of duty. In the typical lawsuit, the dispute is not over the nature of the defendant's duty, but rather over whether he has breached his duty. The defendant does not disagree that he had a duty to refrain from negligence, but he does disagree that he was negligent. For example, Adams, who is babysitting three-year-old Quincy, leaves him alone in the house watching television while she returns a step-ladder to the next door neighbor. During Adams' absence, Quincy leaves the house and is struck by a bus when he darts in the street. Adams has duty to supervise the child non-negligently, and it probably would have been safer to have carried Quincy with her when she returned the ladder, but was Adams negligent in leaving Quincy alone in the house?

In the usual tort case, the question of whether the defendant's conduct amounted to a breach of his duty is a question for the jury. The jury not only decides what happened--whether, and for how long Adams left Quincy alone--but whether what happened amounted to negligence--was it negligent for Adams to leave Quincy alone for as long or short a time as she did. There are, to be sure, some cases in which the judge may decide that reasonable persons could not differ on the question of whether the defendant's actions were negligent and decide the matter himself.[23] And there are other cases in which the defendant has violated a safety regulation, and again the question of negligence is no longer put to the jury.[24] The jury will be asked to decide whether the defendant was driving over 25 mph on a road with a posted speed limit of 25 mph, but not whether such action constitutes negligence. The government has already decided that it does. In general, however, the jury has a fairly free rein in deciding what behavior constitutes negligence.

(3) Causation. The plaintiff must further prove that the defendant's breach of duty caused the plaintiff's injury. In many cases, this may not be problematic, but in some it is. For example, Farfield is speeding and runs down Arthur, killing him. However, Arthur had darted into the road, so that even if Garfield had not been speeding, he would have run down and killed Arthur.[25] Therefore, although Garfield's driving did in fact result in Arthur's death, Garfield's negligence--his speeding--did not because Arthur would have been killed even in the absence of speeding. In such a case, Garfield would not be liable even though he was negligent.

Even when the defendant's negligent conduct in fact causes an accident, the plaintiff's case may fail because the causal connection is not close enough. For example, Pierce is driving his bus too fast and is ahead of schedule. It is a very windy day and an old oak is uprooted and falls on the bus injuring Buchanan. Undoubtedly, Pierce's speeding was a cause of the accident. The bus would not have been in a position to be hit by the tree but for the speeding. However, speeding does not increase the risk that trees will fall on the speeding vehicle. The causal connection between the negligence and the injury is thus not close enough--in legal terms, it is not "proximate."[26]

(4) Damages. When the defendant breaches his duty to the plaintiff and thereby causes him only some

inconvenience or irritation, the defendant is not liable to the plaintiff if the plaintiff has not sustained some "damages." If, for example, the acrobatic Arthur is able to jump out of the way of Garfield's speeding vehicle and thereby save himself from any injury, Garfield is not liable to Arthur despite the fact that Arthur may have had a momentary scare and have been justifiably angry at Garfield. De minimis non curat lex is the law's Latin response to this situation: "The law is not concerned with trifles." (An exception to this rule is when there is an intentional tort, as in the old case of the hatchet swung at the tavernkeeper's wife noted above.)

B. Affirmative Defenses

As I have previously stated, there may be a dispute in a given lawsuit about any one of the issues just discussed--duty, breach, causation and damages. The plaintiff loses unless the court decides that it is more probable than not that the defendant breached his duty and that the breach caused the plaintiff damage. Even if the plaintiff is successful in this, the defendant is not without recourse: He may prove one or another affirmative defense. With the affirmative defenses, the defendant is no longer denying some claim of the plaintiff's--for example, "I was not exceeding the speed limit"--but is now stating something affirmatively--"the plaintiff was crossing the street negligently."

(1) Assumption of risk. One such affirmative defense is based on consent. Hayes runs a drag-race track, and Tilden is one of his customers. As a condition of using his track, Hayes requires that his customers enter into a written contract agreeing not to sue him for negligence. Tilden enters into such an agreement and is injured during a race when he runs into a 36-inch, 100 pound cylinder head left on the track from the previous race. Hayes' employees had negligently failed to remove or to discover this dangerous debris.[27] Despite Hayes' negligence, Tilden is barred from recovery because of his agreement. He had "assumed the risk." The Latin phrase is volenti non fit injuria ("There is no injury to the willing").

(2) Contributory negligence. Another affirmative defense is "contributory negligence". Forrester is repairing his house and leaves a pole extending into the road. The pole is visible at a distance of 100 feet and can be avoided with the exercise of care. Forrester's act is obviously negligent. However, Butterfield comes down the road at an excessive speed and collides with the pole seriously injuring himself. Butterfield is himself negligent in failing to use due care regarding his own safety.[28] Under traditional law, such negligence on the part of the victim--called "contributory negligence"-- was a "complete defense," that is, the defendant was found not liable to the plaintiff.[29]

In the last couple of decades most states have rejected this all-or-nothing approach.[30] The plaintiff's negligence is taken into account to reduce the amount of damages to which he is entitled, but it does not totally bar his recovery. This approach is called "comparative fault" or comparative negligence." North Carolina is in a distinct minority of states that still gives contributory negligence the effect of a complete bar.[31]

(3) Immunity. One other noteworthy defense is that of immunity. Here the defendant may grant for the sake of argument that he negligently injured the plaintiff and that the plaintiff neither assumed the risk of such injury nor failed to exercise due care with regard to his own safety; nevertheless, the defendant maintains that he is not liable because he is immune.[32] Such immunities traditionally existed between family members and also protected charitable institutions such as hospitals as well as governmental bodies and officials. In general, modern tort law has tended to eliminate or restrict such immunities.[33]

III. WHAT IS THE DOLLAR VALUE OF THE VICTIM'S INJURY?

Injury inflicts three kinds of losses on victims and their families:

(1) additional expenses, chiefly medical expenses;
(2) lost earnings;
(3) pain and suffering.

The chief difficulty with the first two kinds of losses arises in cases in which these losses are expected to continue after the lawsuit has been completed. Because a lawsuit is a once-and-for-all affair, the court must estimate what losses the victim will incur in the future and what the present value of those future losses is. It is theoretically possible that the lawsuit could be kept open for periodic assessment of the victim's losses, but that possibility has not been adopted.

Greater controversy surrounds awarding damages for pain and suffering. Although there is no doubt that victims suffer some pain and suffering when they are injured, it is difficult to determine the extent of another's pain and suffering and further to translate pain and suffering into money. Unlike damages for expenses and lost income, where the court is replacing money with money, damages for pain and suffering replace a non-monetary loss with money. Although these are formidable difficulties, not providing the victim with any monetary compensation for his pain and suffering because of these difficulties insulates the injurer from paying for a loss that he has wrongfully inflicted on another.

There are various possible answers to the question of whether pain and suffering should be compensated. One is to bar damages for pain and suffering. Workers' compensation, for example, does not compensate for the victim s pain and suffering.[34] Another solution is to put an arbitrary cap on pain and suffering damages.[35] Still another is for the court to exercise stringent oversight on the award of pain and suffering damages. The court can require the jury to specify the amount it is awarding the plaintiff for pain and suffering (rather than permit it to render an undifferentiated general verdict)[36], and then the court can exercise its power of remittitur in those cases in which it determines that the amount awarded for pain and suffering is excessive. Remittitur is the court's power to give the plaintiff the option of re-trying the case or accepting an amount less than that awarded by the jury.[37]

IV. WHO PAYS THE VICTIM--AND HOW MUCH?

Adams is held liable to Jefferson, and the monetary value of Jefferson's injury is found to be $100,000. Is Adams liable to Jefferson for the entire $100,000? The basic answer is "yes" because the goal of tort law is to make the victim whole--in other words, to shift all of the loss from the victim to the injurer. However, as the quotation at the beginning of this primer states, tort law is concerned with a balancing of interests. Thus tort law is also concerned about not imposing a devastating liability on a defendant when the victim can otherwise be compensated and about fairly apportioning losses between plaintiff and defendant as well as among defendants if there are more than one.

No liability--victim relegated to his own insurance. The tort system is not the only means of compensating victims in American society. The victim may have insured himself against such loss either individually or through a group. In addition, government services may be available to the victim. The question arises whether the victim should be required to look entirely to these other sources of compensation or whether his damages should be reduced by the amount he receives from these private and public sources.

In a century-old railroad fire case from New York, the highest court of that state established a first-structure rule. That rule provided that although a negligently caused railroad fire did in fact burn a large number of structures, the railroad was liable only for the first structure. The key justification for the court's position was that "(i)n a commercial country each man, to some extent runs the hazard of his neighbor's conduct, and each, by insurance against such hazards, is enabled to obtain a reasonable security against loss. To neglect such precaution, and to call upon his neighbor on whose premises a fire originated, to indemnify him instead, would be to award a punishment quite beyond the offense committed."[38]

The justification combines several points. First, the benefits of commercial development (including railroads) are widespread. In accepting such benefits, the members of such a society can be expected to bear the associated risks. Second, the equity of this position is emphasized by the widespread availability and use of fire insurance. Third, it is better to spread the loss among many, than to impose it on a single entity (the railroad). The New York court was willing to deny liability entirely to some victims in order to protect the defendant from potentially devastating liability.

Collateral source rule. As a less stringent alternative to the denial of any compensation, the defendant's liability could be diminished in an amount equal to those benefits the plaintiff actually receives from other sources, such as his own insurance. For example, Pierce negligently injures Buchanan, and Buchanan suffers losses amounting to $100,000. Buchanan's insurance will pay for $50,000. Should Pierce be liable to Buchanan for the entire $100,000 or only $50,000? Remember the goal of tort law is to make the victim whole. If Pierce is liable for $100,000 and Buchanan collects $50,000 in insurance, then Buchanan receives a total of $150,000 as a result of his injury. Some argue that this amounts to a windfall for the victim. If Pierce is liable for only $50,000 and Buchanan receives $50,000 in insurance benefits, then Buchanan receives a total of $100,000 as a result of his injury. This second result appears to some to be more consistent with the goal of tort law.

Several points may be made in response. First, it is preferable for the victim Buchanan to receive a windfall than for the injurer Pierce to pay less than the full value of the loss he has inflicted. Recall the point made earlier that liability may serve an accident-prevention function even when the compensation function is otherwise satisfied. Second, the first point is strengthened when Buchanan's collateral sources are the result of his own thrift and prudence, as when he has paid for health and accident insurance. The plaintiff, not the defendant, should receive the benefit of the plaintiff's prudence. Third, the provider of the collateral source will typically have contracted with the victim that the provider will be subrogated to the victim's claim against the injurer. For example, Harrison and Polk enter into an insurance contract whereby Polk, the insurer, agrees to pay Harrison's medical expenses should Harrison incur them. The contract also provides that Polk is subrogated to any tort claim that Harrison has arising from the injury that results in medical expenses covered by the insurance contract. Taylor negligently injures Harrison causing him to incur medical expenses of $30,000. If Harrison obtains a tort judgment against Taylor for $100,000, Polk, the insurer, is entitled to reimbursement of $30,000 from Harrison. Therefore, Harrison would not obtain a windfall. He would receive no more than $100,000, consisting of the $30,000 he obtained from his insurer Polk and his $70,000 share of the tort judgment against Taylor.[39]

The traditional response of tort law has been the "collateral source rule," which states that the defendant's liability should not be reduced because plaintiff has received compensation for his injury from other, collateral sources--that is, sources other than the defendant himself.[40]

Limited liability--workers ' compensation. Workers' compensation, an off-shoot of tort law, is a somewhat different example of an injurer's not being required to make good all of the victim's loss. Unlike the railroad case which denied liability, workers' compensation does provide compensation. It does not, however, fully compensate for wage loss and provides no compensation for the victim's pain and suffering. To be sure, the victim receives a countervailing benefit in that he is entitled to compensation whether or not the employer was negligent.[41]

There are other rules of tort law--actual or proposed--that result in the plaintiff's receiving only partial compensation. These include comparative negligence as well as the elimination of joint and several liability.

Comparative negligence. The traditional tort rule was that the victim's own negligence barred him from recovery: the defendant would not be liable to him at all. In the past twenty years, many states have exchanged this traditional all-or-nothing rule for "comparative negligence." Under a rule of comparative negligence, a negligent victim is not barred from recovery, but the amount of his recovery is reduced because he was partially at fault. For example, Jefferson's losses are valued at $100,000, and Jefferson is found to be 25 percent at fault. He would be entitled to recover only $75,000 from Adams.

Joint and several liability. In some cases more than one defendant is found liable to the plaintiff. For example, Madison and Monroe collide because each is driving negligently and as a result Jackson, a pedestrian, is injured. Jackson's injury is valued at $100,000. Typically, Madison and Monroe are each liable to Jackson for the entire $100,000. "Joint and several liability" is commonly used to refer to this situation--that is, where a plaintiff obtains a judgment for the entire amount of his damages against each of several defendants. Thus, Jackson is not entitled to collect more than a total of $100,000, but he is entitled to recover the entire amount or any lesser amount from either Madison or Monroe.[42]

Traditional tort law did not permit contribution among joint tortfeasors.[43] If Jackson chose to collect the entire $100,000 from Madison, Madison would not be entitled to collect any portion of that from Monroe despite the fact that Monroe was no less liable to Jackson than was Madison. That traditional rule has been modified so that contribution among joint tortfeasors is permitted. The amount of contribution can be determined in one of two ways. The first is simply to divide 100 percent by the number of tortfeasors. If there are two tortfeasors, the share of each is 50 percent; if four tortfeasors, 25 percent.[44] The other method of determining contribution is by relative fault.[45] The trier of fact would be permitted to find, for example, that Madison was 75 percent at fault and Monroe 25 percent at fault. In that case, if Madison paid the entire $100,000 to Jackson, Madison would be entitled to receive only $25,000 in contribution from Monroe.

The fact that tort law permits contribution among joint tortfeasors does not necessarily abolish joint and several liability. In the case we have been discussing, Madison and Monroe are each liable to Jackson for 100 percent of Jackson's injuries. Their rights of contribution are against one another; they do not limit their liability to Jackson. Thus if one of the tortfeasors is judgment-proof--that is, if he is able to avoid paying the judgment either because he is bankrupt or because his assets are beyond the reach of the court--his being judgment-proof does not prevent the plaintiff from recovering the entire judgment from another defendant. In other words, the risk of a joint tortfeasor's being judgment-proof falls on his fellow tortfeasors and not on the plaintiff.

Some have maintained that the plaintiff should bear the risk of a tortfeasor's being judgment-proof. Thus if Madison is held 75 percent at fault and is judgment-proof, Jackson would be entitled to recover only 25 percent of his total damages from Monroe, or $25,000. Hardship is unavoidable in this situation. Either Jackson must wind up with considerably less than the monetary value of his loss or Monroe must wind up paying considerably more than his fair share. The traditional answer has been that the risk of a judgment-proof defendant should fall on a wrongdoer rather than on the innocent plaintiff.

This traditional answer is placed under substantial pressure in two situations. The first is where the judgment-proof defendant is by far the greater wrongdoer. If Monroe is found to be 10 percent at fault, is it fair that he should pay the entire amount of the judgment? The other situation in which the traditional rule is questionable is where the plaintiff is found to be at fault. This situation considerably weakens the justification that it is better that a fellow wrongdoer bear the risk of a judgment-proof tortfeasor rather than the innocent plaintiff because the plaintiff has been found to be at fault as well. Although comparative fault does not necessarily entail the abolition of joint and several liability, it tends to suggest that both the plaintiff and the defendants should bear the risk of a judgment-proof defendant. Assume that the plaintiff Jackson suffers a loss of $100,000; that he is found to be 10 percent at fault, the defendant Madison 40 percent at fault and the defendant Monroe 50 percent at fault; and that Monroe is judgment-proof. Arguably the equitable solution is for Jackson and Madison to pick up Monroe's share in proportion to their fault relative to one another. Thus Jackson would pick up one dollar for every four that Madison picks up. The result would be that Madison would pay his own share ($40,000) plus four-fifths of Monroe's share (4/5 x $50,000=$40,000) for a total of $80,000.

A principal focus of the tort reform of the 1980s has been in this area of tort law. Tort reform proposals typically include the abolition of joint and several liability and the collateral source rule. In addition, comparative negligence has been continually under consideration in North Carolina throughout this period.

V. SHOULD FLAGRANT WRONG BE PUNISHED BY CIVIL COURTS?

Punitve damages are damages awarded to the plaintiff over and above the amount required to compensate him for the value of his injury. Their purpose is to punish the defendant for especially wrongful behavior.[46] They are awarded in an amount to make the defendant sit up and take notice, and thus the wealth of the defendant is to be taken into account in determining the amount of punitive damages.

Some question whether punitive damages should be available in tort law. They maintain that the goal of tort law is to make the victim whole, and that compensatory damages do just that. If the defendant is to be

punished, that should be done through the criminal law with the additional safeguards provided defendants under that law, and payment should be made to the government rather than to the fully-compensated plaintiff. Some jurisdictions, England among them, have virtually eliminated punitive damages, reserving them for very special cases as where there is oppressive, arbitrary, and unconstitutional conduct by a government official.[4]

VI. WHO PAYS FOR THE LAWSUIT?

The tort system is generally perceived as comparatively inefficient, with less than 50 percent of the liability insurance payout going to the victims.[48] Alternative forms of dispute resolution or alternative forms of compensating victims are attractive if they accomplish roughly the same goals at substantially lower cost.

Another principal cost-of-litigation issue is the costs of the litigation to the parties. The losing party is typically ordered to pay the court costs of the winning party, but those costs do not include attorney's fees, which are in fact the biggest part of a party's litigation costs. The general rule in the United States is that each party pays his own attorney.[49] This rule undermines the general goal of tort law to make the victim whole. Thus if Jefferson's injury is valued at $100,000 and his attorney's fees are $30,000, Jefferson winds up with considerably less than the full value of his injury.

This discrepancy between the gross and net award is often appealed to as a basis for justifying various damage rules, including damages for pain and suffering, the collateral source rule, and punitive damages.[50] It may be more forthright to deal with the problem by awarding, as do the English, reasonable attorney's fees to the prevailing party. Certainly, when these costs are awarded to the plaintiff, it represents an accurate recognition that the defendant's negligence has imposed these costs on the plaintiff no less than it has imposed medical costs on him.

The final issue involves the "contingent fee." American law permits tort litigants to enter into contingent fee contracts with their attorneys, whereby they agree to pay the attorney a percentage of the amount they recover by way of settlement or judgment. Thus if the plaintiff receives nothing, the attorney receives nothing. There are two general concerns in this area. First, some are concerned that the contingent fee encourages litigation to too great an extent because the plaintiff is not checked by the risk of being out-of-pocket if his lawsuit is unsuccessful. It is said in response that the plaintiff's attorney himself provides a check on the plaintiff's desire to sue because he is unlikely to take cases that he doesnot think likely to provide him with a sufficient return for the work he puts into them.

The other concern is whether the attorney's share is too large. The typical justification is that the attorney earns his fee because the plaintiff is better off with an attorney than without one and that he would be unable to afford an attorney but for the contingent fee arrangement. That argument ignores that many valuable services--for example, insurance, utilities--are regulated. The key issue is whether there are differences in bargaining power between the parties that are so substantial as to put the potential client at an unfair disadvantage. It is noteworthy that some states have regulated contingent fee arrangements by establishing schedules of permissible marginal rates.[51] On the other hand, Americans have a longstanding and deep-seated reluctance to interfere with the market.

VII. THE SPECIAL CASE OF MEDICAL MALPRACTICE

The practice of medicine, like other professions, involves knowledge and skill that are not generally found in society. Not only do physicians receive extensive training before they are licensed to practice medicine, but the medical profession is continually developing new information and new techniques regarding injuries and diseases and their treatment. When people obtain treatment from a physician, tort law requires that they receive the benefit of such expert knowledge and skill. They are entitled to not simply the care that an ordinary person could provide but to the care that a highly trained professional should be able to provide.[52] Not that the law holds the physician strictly liable for any undesirable results of treatment: liability depends in this situation as in others upon the victim's showing that the physician was negligent.[53]

A. Standard of Care

A special problem that medicine presents to tort law regards the standard of care to be applied in order to determine whether the physician was negligent. We certainly expect the physician to be more knowledgeable and skillful than a layperson, but just how knowledgeable and skillful do we expect him or her to be? This problem of the proper standard of care is compounded by the jurors' ignorance of the practice of medicine. In order for the jury to determine whether the defendant was negligent, it cannot, as in most cases, rely on its own collective experience but must depend on being informed by an expert on what is proper medical practice in a particular case. This compound problem makes actions of alleged medical malpractice different from other kinds of negligence actions and results in certain exceptions to the usual negligence case.

Tort law does not generally consider the customary practice of a group as conclusive evidence of what constitutes due care in a particular circumstance. As Justice Holmes put it: "What usually is done may be evidence of what ought to be done, but what ought to be done is fixed by a standard of reasonable prudence, whether it usually is complied with or not."[54] An exception to this general rule is the case of alleged medical malpractice, where customary practice does provide the standard.[55] A principal reason for this exception is that laypersons have no reliable information about what a physician should do; therefore, they must be guided by expert opinion, and that expert opinion is based on the customary practice of the profession.[56] Consider, for example, the question: "Is it negligent to pack Surgicel tightly around the spinal cord in an attempt to stop extensive internal bleeding?"[57] Most adults would feel utterly incompetent to answer that question. They have undoubtedly dealt with external bleeding and have used bandages and perhaps even a tourniquet, but extensive internal bleeding is outside their experience. Beyond that, the word "Surgicel" means very little. One may deduce that it is something used to stop bleeding, but what its properties and especially its risks are, are completely unknown to most adults. Because the jury is incompetent to determine the question at issue on the basis of its own collective knowledge and experience, the plaintiff must present a medical expert to testify that the physician's treatment was negligent in order to avoid the judge's dismissing his case. The expert will testify not in terms of what he personally would have done in the defendant's position but whether what the defendant did was in accordance with customary practice.[58] Of course, there will be some cases in which laypersons will not need to rely on an expert in order to determine that the defendant did not exercise due care, as when a surgeon closes an incision and inadvertently leaves a sponge or part of a test tube inside the body.[59]

Customary practice can be specified by kind of practice and by location. As to kind of practice, a general practitioner will be held to the standard of the customary practice of general practitioners and not to the customary practice of specialists.[60] And so long as society permits a certain kind of health provider to practice, he is held to the customary practice of the particular school to which he belongs. Thus chiropractors and podiatrists are held to the customary practices of their respective schools and not to the customary practice of physicians.[61] As to location, there has been a longstanding distinction between a local standard and national standard. The local standard has two versions. One is a "strict locality" standard, which is the standard of care provided by physicians in the defendant's own community.[62] The other is the "similar locality" standard, which is the standard of care provided by physicians in the defendant's own community or in a similar community.[63]

In contrast to both local standards is the "national" standard, which does away with geographical considerations in determining the proper standard of care.[64] The rationale of the strict locality standard, which was first enunciated in cases decided in Kansas and Iowa in the early 1870's, was that it was unfair to hold the rural and small town practitioner to the same standard as the urban physician because the former had fewer opportunities for developing his skills.[65] The rule was challenged on three grounds. First, when the defendant was the sole practitioner in a community, his standard of care was the community standard of care.[66] Second, even when there were other practitioners in the community, a "conspiracy of silence" among them could prevent the plaintiff from obtaining expert testimony.[67] Third, changes in the education and the continuing education of physicians in the past century have made the rule out of date.[68] Early medical education consisted of lectures over six months followed by apprenticeships with physicians with even less formal education. Today, of course, the training of physicians is much more extensive, and a national accrediting system has contributed to the standardization of medical education. Moreover, vastly improved transportation anand and communication have greatly reduced, if not eliminated, the isolation of the rural practitioner from the urban.

The similar community standard answers the first two criticisms of the strict locality standard in that it permits physicians who are not personally acquainted with the defendant to testify for the plaintiff. But it does not address the third. Thus a national trend toward the national standard developed until it was curtailed by legislation enacted in response to the medical malpractice crisis in the mid-1970's.[69] Legislation in North Carolina has enacted the same or similar community standard, thereby forestalling the possibility of judicial adoption of a national standard.[70]

B. Informed Consent

It is a general rule of tort law that to touch another person in an offensive or harmful manner is wrongful--it amounts to what is called a battery.[71] However, touching that would otherwise amount to a battery may not be a battery in a particular situation because the person touched has consented to it--explicitly or implicitly. Thus it makes all the difference whether the jarring tackle a runner receives occurs on a football field or in an airport. In the former case, he consents to the risk of being tackled; in the latter he does not.

In the medical context, a physician may be liable to a patient for a battery if he has not obtained the patient's consent to perform a procedure or operation.[72] There are some cases, however, in which the physician has obtained the patient's consent, but the patient did not really understand what he was consenting to. The physician's obligation to the patient includes providing him with sufficient information so that the patient can give his informed consent. If the physician fails to provide the patient with sufficient information, he may be liable for negligence.[73]

Here again the issue of the proper standard of care comes into focus. Is the physician obligated to provide information that is customarily provided by physicians of his type of practice in his or a similar locality, or can the court examine the reasonableness of the physician's actions regardless of the customary practice? Some courts have stated that the patient's right to know should not be limited by customary medical practice.[74] Because it is the patient's body, the patient should make the decision for himself and not have the decision made for him by the physician either directly or indirectly by not providing him with all the information the patient needs in order to make the decision. This view emphasized patient autonomy over professional discretion.[75]

CONCLUSION

The law of torts is a highly developed body of law. At virtually all law schools, the first year student spends many class hours investigating its complexities. The principal one-volume treatise of the subject is over a thousand pages long, and there is a much longer multi-volume treatment of the subject. It goes without saying that this primer does not pretend to have fully explored the subject. Nevertheless, I hope that the reader will come away with a comprehensive overview of the subject, with a grasp of the main outlines and a sense of the interrelatedness of the various aspects of tort law. I have delineated these in terms of five basic questions: (1) Is the defendant liable at all? (2) What is the extent of the plaintiff's damages? (3) Who should pay how much of those damages? (4) Should the defendant be punished beyond paying the plaintiff compensation? (5) Who should pay the process costs?

Debate about tort law and tort reform will occur on one or more of these basic questions, and the debate will often involve an interrelation of these questions. For example, at the turn of the century, an earlier tort reform movement, concerned with employment injuries, resulted in the enactment of workers' compensation statutes. These statutes attempted to provide an inexpensive process (question five) whereby the issue of liability (question one) could be readily resolved in favor of the victim. As a trade-off, the employer was responsible for only a part of the victim's loss (questions two and three), and punitive damages were not available (question four).

Tort law has various goals, and those goals remain fairly stable over time. However, the society may develop other mechanisms for satisfying one or another of those goals, and that will have an impact on tort law.

Indeed, that impact may be so substantial that tort law will virtually disappear, as in New Zealand. Technological change will also have an impact on tort law, as will the felt necessities of the time. In one time and place, it will be considered fair to bar a victim from any compensation if he has negligently contributed to his own injury. In another time and place, such a rule will be considered unfair. As the quotation from Dean Prosser at the beginning of this primer states, "ultimately the law must coincide with public opinion," but he goes on to note that public opinion may itself be "in a state of division and flux."

The law of torts has ancient roots and can be found in virtually all societies. In Anglo-American law it has been continually developed, especially since the Industrial Revolution, as technological and social change and the felt necessities of the time have impressed themselves on the received body of law. Legal change has been brought about both by the courts, as in the development of negligence and strict liability, and by legislatures, as in the enactment of statutes providing for workers' compensation, contribution among joint tortfeasors and comparative negligence.

The scope of possible change is enormous, ranging from the virtual replacement of the tort law by social insurances as in New Zealand to the retention of much of the traditional body of tort law as in North Carolina itself. I hope that this primer will enable citizens to appreciate and participate knowledgeably in the ongoing reconsideration of the law of torts.

APPENDIX A

DISTINCTIVE FEATURES OF ENGLISH TORT LAW

[The following is a summary of a talk on English tort law given to the North Carolina State Goals and Policy Board by Kersi B. Shroff. Mr. Shroff is an English barrister of Lincoln's Inn and a senior legal specialist in the American-British Law Division of the Law Library of the Library of Congress.]

English law is the origin of American tort law, and the bodies of tort law in the two countries have developed along very similar lines, both because of their single origin and because the principal stimulus to modern developments in tort law in the two countries was the Industrial Revolution. The tort laws of the two countries are distinctive in a number of respects, however, and the distinctive features of English tort law will be discussed below.

Restriction of jury trial. Jury trial is much more limited in England than in the United States. In civil cases, jury trial has been limited in England since 1933.[76] A litigant can have a jury trial as a matter of right only in certain kinds of cases--defamation, for example, or fraud or malicious prosecution. In personal injury cases, the court has the discretion to use juries, but in 1965 the Court of Appeal decided that it would no longer hesitate in upsetting jury awards which were out of proportion to the circumstances of the case.[77] This decision resulted in the virtual elimination of juries from personal injury actions.

Effect on damages. Because of the virtual elimination of juries, judges are now responsible for assessing damages, and awards made by the judges have acquired a high degree of uniformity. An unofficial tariff has developed to which the judges attempt to adhere. This unofficial tariff is very well publicized in the legal profession, and settlement is thereby encouraged because the litigants have a good idea of the amount the judge is likely to award.

The reasons given in support of this regime are as follows. First, judges bring a professional approach to cases. They are typically appointed from the ranks of senior lawyers, mostly Queens Counsel. Normally, one becomes a Queen's Counsel after at least ten years of the practice of law. Therefore, by the time a person is made a judge he or she is quite experienced. Second, judges articulate their reasons for making their awards and are aware of what other judges have done in other cases. Juries, on the other hand, are not professional jurists and do not state the reasons for their decisions. They are thus inexperienced, unaware of decisions in other cases, and unconstrained by any requirement of articulating the reason for their decisions. Juries are

thought to be very receptive to the plight of individual victims, and jury awards are thought to be both high and inconsistent.

Kinds of damages. English courts award both pecuniary damages, such as medical costs and loss of earning, and non-pecuniary damages. Medical costs are negligible because of the National Health Service. Non-pecuniary side damages include damages paid for loss of limbs. The English position is that damages cannot compensate the victim fully for such losses.[78] The judges attempt to arrive at what they think is a fair figure--something that is going to give the victim some comfort in life but will not fully compensate him for his loss. These payments are quite modest in comparison to those awarded in America. Another component of non-pecuniary damages is an amount awarded for the victim's pain and suffering. The same general approach is used as with loss of limbs. There was also previously a separate category of non-pecuniary damages for "loss of expectation of life," but this was statutorily abolished.[79]

Size of damage awards. In 1986, personal injury damages were awarded in England and Wales in 970 road accidents cases.[80] Of those 970 cases, damages in excess of 50,000 pounds were awarded in only 120 cases. (The sterling is currently valued at approximately $1.80) The majority were in the category of between 10,000 pounds and 50,000 pounds. Three hundred and forty cases were in that range. Another large number of cases (120) fall between 5,000 pounds and 7,000 pounds. Non-money judgments were awarded in 150 cases. In some rare cases, in what is called the "living death" situation, where the victim is in a chronic vegetative state, large payments, exceeding one million pounds, have been made in the past few years.[81]

Collateral sources. As to collateral benefits, the American view is gaining ground in England. That is to say, that the defendant should not be credited with the benefits of the plaintiff's collateral sources, especially when they are the result of the plaintiff's thrift or effort, his public and private pension plans, for example. Where the plaintiff has made use of the free medical facilities available under the National Health Service, the defendant will not be liable for medical expenses.[82] Nor is the Service entitled to sue the defendant for the costs of the service it has provided the plaintiff.[83] If the plaintiff receives any Social Security benefits, his damages are reduced by one-half the amount he receives in such benefits during the first five years.[84]

Punitive damages. With very limited exceptions, exemplary or punitive damages are no longer available in England, having been abolished by a decision of the House of Lords rendered in 1964.[85] The court was persuaded that it was the function of the criminal law, not the civil law, to punish. Moreover, the court viewed punitive damages as an unjustified windfall to the plaintiff. One area in which punitive damages have been retained is where there is oppressive, arbitrary and unconstitutional conduct by a government servant. A second area is where the defendant deliberately sets out to make a great profit, regardless of the way he affects the plaintiff, and that profit is going to be far in excess of whatever compensation he is asked to pay. A case exemplifying this involved a book that defamed a distinguished naval officer by giving an inaccurate account of his conduct as commander of a destroyer in a famous episode during the Second World War.[86]

Joint and several liability. English law requires that the defendants have acted in concert for them to be held jointly and severally liable.[87] Thus joint and several liability will not be imposed in a case where the plaintiff is injured due to the combined fault of two drivers, who were not involved in any concerted activity such as drag racing. Each driver will be liable only to the extent of his fault.

Cost of litigation. In both England and the United States, the rule is that "costs follow the event," which means that the successful party, whether the plaintiff or the defendant, receives reimbursement of his costs from the loser. An important distinction, however, is that in England these costs include attorney's fees.[88] At the end of the litigation, the parties submit their costs to a reviewing officer of the court, called a "taxing master." The master will allow only those costs that are "necessary for the conduct of litigation." In practice, the winning party tends to recover about 70 to 75 percent of his actual costs. It is believed that the English rule has a cautionary effect on litigants in causing them to think twice about pursuing doubtful claims or defenses.

Payment into court. A defendant may estimate the amount of his prospective liability and pay that amount into court. The plaintiff has twenty-one days within which to decide whether to accept that amount as a settlement of his claim or to proceed with the action. If he chooses to proceed and the judge, who is not

permitted to know about the defendant's payment into court, awards damages in an amount lower than that paid into court by the defendant, the plaintiff becomes liable for the cost of the action from the date that payment was made into court.[89]

APPENDIX B

DISTINCTIVE FEATURES OF TORT LAW IN CIVIL LAW SYSTEMS

[The following is a summary of a talk on tort law in civil law systems (principally Germany) given to the State Goals and Policy Board by Edith H. Palmer. Dr. Palmer received a J.D. from the University of Vienna in 1963 and clerked for several Austrian judges in 1963 and 1964. She is currently a senior legal specialist in the European Law Division of the Law Library of the Library of Congress.]

In England, tort law is mainly derived from judicial opinions in decided cases. In contrast, the tort law of European nations is part of systematic compilations of the law called Civil Codes. The most famous Civil Code is that of Napoleon, enacted in 1804. It is a product of the age of Enlightenment, founded on the belief that it was possible to state all the legal principles governing the relations between individuals in a society. It was a revolutionary achievement in that it put all members of society on an equal footing, doing away with class privilege and local peculiarities.

Germany is another major civil law country. Its code was enacted considerably later than France's, in 1896, and became effective in 1900. With regard to tort law, the lateness of its enactment is significant in that the industrial age was well underway, and the need for a developed tort law was evident. Thus the German Code contains thirty sections on torts[90] as compared to only five sections in the earlier French Code.[91]

Some of the prominent features of European tort law, as exemplified by German law, are as follows:

Procedure. Several features of German procedure are significantly different from American procedure. There is no jury in civil trials. The judge takes a more active role in the trial, and because there is no jury, there is less need to conclude the proceedings in a short period. The proceedings can be adjourned if the need for additional evidence arises in the course of the trial. Because of this ability to suspend the proceedings, there is no pre-trial discovery in Germany.[92]

Bases of liability. German law, as well as the laws of other countries, employs two bases of liability. The basis of liability found in the Code is the traditional one of fault.[93] In addition, certain modern statutes use strict liability, although strict liability can be found as early as the Prussian Railroad Law of 1838.[94] The application of strict liability has been expanded to include railroads, automobiles, aircraft, water pollution, electric cables, gas pipelines, products, and, since 1976, pharmaceutical drugs.

Strict liability laws cover mostly insurable risks. Germany, for example, has had mandatory liability insurance for automobiles since 1939.[95] Strict liability, especially with respect to railroads and automobiles, can be found in the laws of other countries, including Austria, Denmark, Norway, Sweden (until 1975), Japan, Italy, and even in some socialist countries.

Size of awards. Damage awards in Germany are much lower than in the United States. The principal reasons are a more restrictive attitude in awarding damages and the availability of social benefits. In particular, damages for pain and suffering are lower than in the United States. Case law has established predictable amounts, and these have been compiled in tables. The highest award has been 360,000 DM (Deutsche Mark) for a paraplegic with other problems as well.[96] (The Deutsche Mark is currently valued at approximately $1.60.)

Caps on liability. In cases in which liability is based on strict liability, Germany and other countries employ caps to limit the amount of recovery. A typical cap for automobile and other cases of strict liability is 500,000 DM for personal injury to one victim and 750,000 DM if several persons are injured in a single accident.[97] A justification for caps in strict liability cases is that in the absence of fault, the defendant should not be exposed

to unlimited liability. In under strict liability addition to caps, damages for pain and suffering are not available. Because of these limits on recovery, plaintiffs often attempt to bring their cases in negligence, where there are not such limits on the amount of compensation.

Social benefits. Germany has an extensive social welfare system, which consists primarily of social security (old age and disability), mandatory health and accident insurance. Most Germans are covered by one or several plans. When a German wage earner is injured, he remains on the employer's payroll for six weeks, then receives sick pay from the medical insurer (up to 78 weeks within three years) practically until he receives a disability pension. His medical treatments are provided by medical insurance.

The social insurers have a statutory right of subrogation to the victim's claim against the tortfeasor.[98] The victim is awarded only the damages that have not been compensated by the social insurance carriers. Of course, in the typical case the social insurer is not paid by the tortfeasor himself but by liability insurers. Social benefits must be accepted by the victim under the principle of the victim's obligation to mitigate damages.[99] However, the victim can elect to use private medical treatment, but these costs will be awarded as damages only to the extent that they would have been incurred under social medical treatment, unless special circumstances justify the additional expenditures.[100] Private health insurance policies may provide for subrogation. Life insurance is not deducted from the award. As with the collateral source rule in the United States, the tortfeasor is not supposed to benefit from the victim's thrift.

Comparative fault. When the victim is partly to blame, his recovery is reduced but not eliminated. The respective faults of the victim and the injurer are apportioned in percentages. Comparative principles are applied regardless of whether liability is based on fault or strict liability.[101]

Joint and several liability. Each tortfeasor is liable to the plaintiff for the entire compensation only if one of two conditions are met: (1) the tortfeasors acted together with intent, or (2) it cannot be ascertained which of several tortfeasors caused the damage.[102] For example, if it cannot be established which of several polluters is responsible for the pollution damage, the victim can claim the entire compensation from each.

Payment of awards. Damages for loss of earnings and support of survivors are paid in the form of an annuity.[103] Annuity payments may cease, be suspended, or reduced when a widow re-marries or, in some cases, when she is able to support herself.[104]

Costs. The losing party pays the necessary costs of the winning party, including court costs, attorney's fees, and other expenses.[105] These costs are determined by a clerk of the court. In Germany, it is immoral and unethical to make the payment of the attorney's fee contingent on the success of the lawsuit.[106] German attorney's fees are based on statutory fee schedules.[107] Higher fees can be agreed between attorney and client, but only the statutory fees are awarded as costs. Indigent parties are not precluded from legal representation because of generous legal aid provisions and the widespread use of legal services insurance. Forty to fifty percent of German households have some legal services insurance coverage. Such insurance is not confined to Germany, but is popular in most European countries, and there has been some coordination in the European Economic Community.

ENDNOTES

1. See Cohen v. Petty, 65 F.2d 820 (D.C. App. 1933).
2. "[I]n the main the law started from those intentional wrongs which are the simplest and most pronounced cases, as well as the nearest to the feeling of revenge which leads to self-redress." O.Holmes, The Common Law 128 (M. Howe ed.1963).
3. I de S et Ux v. W de S (probable translation: John of Somerset and Wife v. William of Somerset), Y.B.Lib.Ass.folio 99, placitum 60(England 1348).
4. "The general principle of our law is that loss from accident must lie where it falls, and this principle is not affected by the fact that a human being is the instrument of misfortune." O.Holmes, supra note 2, at 76.
5. One can insure oneself and one's dependents through various lines of insurance against losses arising from personal injury, death, 7.
6. For example, Aid to the Blind, Aid to the Permanently and Totally Disabled, Supplemental Security Income program, Medicaid, Aid to Families with Dependent Children, General Assistance.

7. Of course, tort law can be calibrated so that it will provide compensation in a rather limited number of cases or in a rather large number of cases. Holmes stands for the traditional view that tort law should be restrictive: "The state might conceivably make itself a mutual insurance company against accidents, and distribute the burden of its citizens' mishaps among all its members. There might be a pension for paralytics, and state aid for those who suffered in person or estate from tempest or wild beasts ...The state does none of these things, however, and the prevailing view is that its cumbrous and expensive machinery ought not to be set in motion unless some clear benefit is to be derived from disturbing the status quo. State interference is an evil, where it cannot be shown to be a good." O. Holmes, supra note 2, at 77.

In contrast to Holmes is the mid-twentieth century writer Fleming James, who argued in favor of using tort law as a kind of social insurance: "It is the principal job of tort law today to deal with [human] losses. They fall initially on people who as a class can ill afford them, and this fact brings great hardship upon the victims themselves and causes unfortunate repercussions to society as a whole. The best and most efficient way to deal with accident loss, therefore, is to assure accident victims of substantial compensation, and to distribute the losses involved over society as a whole or some very large segment of it." 2F.Harper & F.James, The Law of Torts 762-63(1956).

8. District of Columbia v. Barriteau, 399 A.2d 563, 566 (D.C. App. 1979); see Moore's Inc. v. Garcia,604 S.W.2d 261, 266 (Tex. Civ. App. 1980) ("fully compensate the injured party").
9. "In contrast to the other main branches, accident insurance was a relatively late development: extensive underwriting of the risks of accidental damage to property or injury to persons, of sickness and legal liability, of burglary, and of other misfortunes or losses did not really occur until the second half of the nineteenth century ..." Supple, Insurance in British History, in The Historian and the Business of Insurance at 6 (O.Westall ed. 1984).
10. The New Zealand Accident Compensation Act 1972 provides for earnings-related compensation and other benefits for all victims of personal injury by accident. It eliminates the right to sue on account of such injuries. G. Palmer, Compensation for Incapacity: A Study of Law and Social Change in New Zealand and Australia 9(1979).
11. See generally G. Calabresi, The Costs of Accidents (1970); R. Posner, Economic Analysis of Law (3d ed.1986).
12. See Salevan v. Wilmington Park, Inc., 72 A.2d 239 (Del. 1950).
13. See Osterlind v. Hill, 160 N.E. 301 (Mass.1928); see also Yania v. Bigan, 155 A.2d 343 (Pa.1959).
14. Brown v. Kendall, 60 Mass. 292 (1850).
15. Gregory, Trespass to Negligence to Absolute Liability, 37 Va. L. Rev. 359 (1951).
16. Id. at 362-64.
17. See, e.g., Wabash, St. L.& P. Ry. Co. v. Locke, 14 N.E. 391, 393 (Ind.1887) (railway accident; reversing judgment for plaintiff, citing Brown). Boyd v. Boston Elevated Ry. Co.,112 N.E. 607, 608 (Mass.1916) (railway-automobile accident; no liability, citing Brown).
18. Restatement of Torts Sec. 519 & 520 (1938) ("ultrahazardous activities") and Restatement (Second) of Torts Sec. 519 & 520 (1977) ("abnormally dangerous activities").
19. See Siegler v. Kuhlman, 502 P.2d 1181 (Wash.1973).
20. The leading case on strict liability for ultrahazardous or abnormally dangerous activities is Rylands v. Fletcher, L.R. 3 H.L. 330 (House of Lords 1868). In that case the owners of a mill were held liable to an adjoining coal mining operation when the water from a reservoir the mill owners had had constructed burst through filled, abandoned mineshafts and flooded the plaintiff's mine. The House of Lords held the mill owners liable despite the absence of negligence because the plaintiff's damage arose from the defendant's "non-natural use" of the land. A traditional application of strict liability for ultrahazardous or abnormally dangerous activities is the use or storage of explosives. See Exner v. Sherman Power Construction Co., 54 F.2d 510 (2d Cir. 1931).
21. Greenman v. Yuba Power Co., 377 P.2d 897 (Cal. 1963)(judicially adopting strict liability for defective products); Smith v. Fiber Controls Corp., 300 N.C. 669, 678, 268 S.E.2d 504 (1980)(because of recent legislation--1979 Products Liability Act--court not inclined to adopt judicially strict liability in products liability cases). See Restatement (Second) of Torts Sec. 402A (1965) (adopting strict products liability).
22. In cases involving explosives, for example, the plaintiff need not show that there was any defect with the explosive or any error in its use. Exner v. Sherman Power Construction Co., 54F.2d 510 (2d Cir. 1931). Similarly, in workers' compensation, the injured employee must show only that his injury arose from and in the course of his employment. 1A. Larson, The Law of Workmen's Compensation Sec. 2.20 (1931).
23. See, e.g., De Lair v. Mc Adoo, 188 A. 181, 184 (Pa. 1936) (Negligent to drive on tires worn through to the fabric); Lubitz v. Wells, 113 A.2d 147, 147 (Conn. 1955) (not negligent to leave golf club lying on ground in the yard).
24. See, e.g. Martin v. Herzog, 126 N.E. 814, 815 (N.Y. 1920) (driving without lights in violation of statute is negligent; "jurors have no dispensing power").
25. Underwood v. Fultz, 331 P.2d 375 (Okla.1958) (excessive speed not necessary component of automobile hitting child); Texas & Pac. Ry. v. McCleery, 418 S.W. 2d 494 (Tex. 1967) (train's excessive speed not necessary component).
26. See Berry v. Sugar Notch Borough, 43 A. 240 (Pa. 1899).
27. See Winterstein v. Wilcom, 293 A.2d 821 (Md. App. 1972); see also Williams v. Nationwide Mut. Ins. Co., 5 N.C. App. 632, 169 S.E. 2d 12 (1969) (assumption of risk applicable in action to recover under uninsured motorist coverage for injuries suffered by mechanic when car he was repairing fell on him).
28. See Butterfield v. Forrester, 103 Eng. Rep. 926 (K.B. 1809).
29. Smith v. Fiber Controls Corp., 300 N.C. 669, 268 S.E.2d 504(1980).

The victim's own negligence would not bar recovery if the defendant had the "last clear chance" to avoid the accident and negligently failed to avoid it. The classic case involved an ass left fettered at the edge of the highway which was run down and killed by the defendant's wagon, which was going down an incline at a "smartish pace," drawn by a team of three horses. Davies v. Mann, 152 Eng. Rep. 588 (Exchequer 1842). In the North Carolina case of Exum v. Boyles, 272 N.C. 567, 158 S.E. 2d 845 (1968), the plaintiff's decedent was changing a tire on the shoulder of the highway when struck by defendant's vehicle. The court stated: "[T]o bring into play the doctrine of last clear chance, there must be proof that after the plaintiff had, by his own negligence, gotten into a position of helpless peril (or into a position to which he was inadvertent), the defendant discovered the plaintiff's helpless peril (or inadvertence), or, being under a duty to do so, should have, and, thereafter, the defendant, having the means and the time to avoid the injury, negligently failed to do so. The only negligence of the defendant may have occurred after he discovered the perilous position of the plaintiff." Id.at 576.

The AMA Council on Scientific Affairs

HENRY N. WAGNER JR., MD

Medicine is an art based on science. Since its inception, the AMA has promoted the advancement of public health and biomedical science in order to be better able to care for patients as individuals.

Established by the House of Delegates in 1976, the Council on Scientific Affairs (CSA) consists of 11 physicians and one medical student. The elected members may have terms of three years up to a maximum of nine years. The members represent a broad spectrum of physician scientists from different medical specialties. The Council meets four times a year at AMA headquarters in Chicago beginning on Sunday mornings at 11:00 a.m. and continuing through the evening, with a final session from 8 a.m. - 12 noon or later on Mondays. Council meetings also are held at the time of the House of Delegates meetings.

Acting as a group and after considerable discussion, Council members identify, delineate, analyze, and recommend AMA policy with respect to scientific issues that affect medical practice and public health. The Council works closely with the AMA Group on Science and Technology, headed by William R. Hendee PhD, an AMA Vice-President, who with his colleagues attend Council meetings. The Group has three divisions: Drugs and Toxicology, Basic Science, and Clinical Science. Together the Group and the Council try to ensure that developments in the science and technology of medicine are brought in timely fashion to the attention of the members of the House of Delegates, all physicians, other health care professionals, and the public.

A fundamental principal of the AMA, the Group, and the CSA is that patient care can be improved only by continually assessing the most current and accurate information with physicians and other health professionals.

A high percentage of the reports are submitted for peer review and publication in the Journal of the American Medical Association (JAMA). Since 1976, the Council has prepared 215 reports, 85 of which have been published in JAMA. Over the past three years, 42 Council reports concerned AMA policy and were transmitted via the Board of Trustees to the House of Delegates which then determined what action, if any, should be taken. Fifty-one reports were informational only and did not involve policy issues.

Dr. Wagner is Professor of Medicine and Radiology and Environmental Health Sciences and Director of the Divisions of Nuclear Medicine and Radiation Health Sciences at the Johns Hopkins Medical Institutions.

Examples of recent reports are four concerning magnetic resonance imaging (MRI) and four on positron emission tomography (PET). A series of reports have been concerned with AIDS. Firearms as a public health problem, cancer risk from pesticides, smoking cessation, and the health effects of radon and ozone are other reports of the past year. The reports are generated by the staff of the Group on Science and Technology, by the appointment of ad hoc expert panels (from 6-10 persons) suggested from nominees made by members of the Council, by professional societies, or by specialty groups. The final approval of panel members is by the Council after nominations have been received.

In 1982 a program called Diagnostic and Therapeutic Technology Assessment program (DATTA) was instituted by AMA and incorporated into the activities of the Council on Scientific Affairs. The function of DATTA is to assess existing and new diagnostic and therapeutic procedures and technologies. Recommendations of topics to be addressed are accepted from all sources but come chiefly from individual physicians. Inquiries often involve controversial issues, the most striking recent example being thermography.

The AMA receives thousands of inquiries every year requesting information about medical practice, many concerned with technical or scientific issues. The staff handles many of these, but selected topics of sufficient importance and complexity are referred to DATTA. Questions selected by the DATTA Subcommittee of the CSA are prepared by staff for evaluation by panels selected from a group of more than 600 experts in various fields who have agreed to participate in the DATTA program. Highly specific questions are asked of the panel members, for example, whether a procedure, technology, or practice is well established, promising, doubtful, or unacceptable. The process usually takes from two to four months before the results are available.

After responses are tabulated, DATTA opinions are published in *JAMA* together with a narrative description of literature reports and panel findings. Each DATTA opinion is prefaced by the statement: "This report is not intended to be construed or to serve as a standard of medical care. If reflects the views of DATTA panelists and reports in the scientific literature as of [date of the report]."

In addition to publication in *JAMA* and other professionals journals when appropriate, DATTA opinions are presented to the AMA Board of Trustees and House of Delegates.

In 1985, the question was raised whether the present method of election of members of the Council by the House of Delegates after nomination by the Board of Trustees should be continued or be replaced by appoint-

ment of the entire Council or a fraction of the members by the Board. The delegates voted with great enthusiasm to continue the present method of election.

For American medicine to maintain its standard of excellence, it is essential that basic and clinical research continue to be the foundation of the practice of the art of medicine. The CSA helps insure that scientific research be given a high priority among competing federal programs.

Council members are important channels for communication between the AMA, political leaders, and the public with respect to scientific issues affecting medical practice, biomedical research, and public health. The CSA plays an important role in facilitating the transfer of technological advances into practice, as well as in the evaluation of the safety, effectiveness, and cost effectiveness of such advances. Its main vehicle is communication via JAMA, AMA-NET, and special publications (such as *AMA News* in which the AIDS reports appeared as a separate inserts). The discussion of science issues at the Reference Committee is another major communication link with delegates and others, such as Surgeon General Koop, involved in health care and biomedical science policy.

At the last meeting of the House of Delegates in June, I had the great honor of being re-elected for a second three-year term on the Council. During my campaign for re-election, I was asked: "What does the Council do for me as a member of Med Chi?" I have tried to begin to answer that question in this brief note and will periodically present CSA happenings of interest to the readers.

Practice Computerization: Hints and Suggestions

HAROLD E. McCRAY

Roughly 13 percent of United States physicians in private practice own microcomputers and use them to manage their offices. This is an increase of nearly 8 percent in just five years. At this rate, 20 percent of physicians will own computers by the end of the decade. The consensus is that the pressures of costs, regulations, and competition render a simple manual ledger ineffective. A ledger cannot provide an alert to recall a patient, summarize financial data, nor produce medical reports for regulatory agencies. Consequently, to remain successful in the 90s, more physicians are turning to microcomputers to "manage" their practices more efficiently.

What are the benefits you and your staff will gain in joining this trend? An automated Practice Management System (PMS) reduces time requirements for some repetitive routines: posting procedure charges, generating monthly bills, and completing insurance forms. It also allows you to see trends in your practice, for example, how many patients experienced a specific illness during a designated period, what changes are occurring in your patient demographics, or when to discontinue accepting assignment of benefits from a third party because of increased disallowances. You can use this information to alert patients or inform your colleagues. Although a PMS can provide some of the benefits of an office manager without the labor cost, it is only a partial solution to managing your practice cost effectively.

Computerization is not synonymous with cost savings. Although a large part of medical practice is information handling, researchers have found that automation alone can produce only about a 25 percent savings. This leaves roughly 75 percent of the medical office work untouched. To attack this 75 percent requires an additional strategy, a restructuring of your practice that lends itself to an improved use of automation.

Where do you start? You should begin by understanding how information flows in your office and how your staff interacts with it. Your staff's involvement is critical. Who else knows more about your practice? Hiring a consultant experienced in installing a PMS will save you time and frustration, but you must find one who will show you how to restructure your practice as well as to automate it. If you choose not to hire a consultant, there are some steps you can take to reshape and better manage your practice.

Start with a thorough analysis and documentation of office routines. Then you and your staff can decide what to streamline (for example, recording data once for different forms) and what to eliminate (for example, the time-consuming photocopying of ledger cards at the end of the month to send to patients as bills).

Develop a schedule, assign responsibilities, and maintain open communication during the analysis and planning process. Use the product of this analysis as your operations and training manual for new personnel. Keeping the manual current will eliminate the frequent complaint: "I don't know how it was done before I came."

Working with your staff in developing simpler office routines encourages their acceptance of these changes.

Goal Setting and Needs Determination

While analyzing your practice, identify your professional goals and appropriate strategies to achieve them. What sort of physician/patient relationship do you want? How do you wish your referring colleagues to view you? What are the critical items required to maintain a healthy practice? Have you identified your competitors? How do you plan to market your advantages? What are your growth plans? In short, determine where you are going before investing in a computer, which is merely a tool to help you and you staff reach your goals.

Having identified your goals and determined the routines needing change, you now must compare the costs with the savings and benefits of investing in an automated office system. Software to handle patient records, accounts receivable, and insurance forms ranges between $1,000 and $2,500 for a solo practice. Basic hardware costs start at $1,500 and can exceed $8,000 depending upon a combination of factors: brand name, operating system (MS-DOS, PC-MOS, UNIX, etc.), microprocessors (8088, 286, or 386), the number of terminals and printers, and whether you plan to electronically process insurance claims.

Expect to pay more for software that has the convenience of multi-tasking. Also, as the number of physicians and staff who will use the system increases, you will need additional capabilities for example multi-user (networking), more memory and storage (hard disk size). These items could easily add another $2,000 per work station. A "turnkey system" (a package that includes software, hardware, accessories and training) usually costs more.

Your savings, such as an improved cash flow and tax benefits (remember depreciation for equipment is over

Mr. McCray is an Automation Consultant.

seven years instead of five) are less easy to identify. It is even harder to give value to the intangible benefits:

(1) a boost in employee morale resulting from eliminating the hair-pulling, end-of-the-month billing crunch

(2) the ability to know the number of referrals from each colleague; or

(3) the capability of printing a "superbill" at the end of a patient's visit.

Software and Hardware Selection

Now you are ready to shop for a system. An important first step is giving proportionally less time to hardware comparison. Use that "extra" time for your analysis and documentation stages and for evaluating software. It is the software that makes the otherwise dumb computer useful and smart. Separate your software needs from your wants. Choosing a billing and collection package that combines word processing will raise the ultimate cost of the PMS. Buying a separate word processing program often proves cheaper.

It is no longer necessary to buy customized accounting packages for your practice. There is off-the-shelf software tailored for medical practice. Choose a package that "looks like" your manual system, yet performs the tasks you wish to automate and still allows you to modify it.

A *single-user system* is the common desk-top computer with one monitor and one keyboard. A single-user system is the obvious choice for a small practice. For larger practices and those in multiple locations, multiple single-user systems are still usually a better choice than multi-user systems (one computer with two or more monitors and keyboards) or local area networks (a cluster of computers connected together), barring special situations. Multiple single-user systems are less complex, have fewer compatibility problems, use cheaper software, and are easier to maintain and to repair than multi-user systems and networks. Only if real-time entry (rather than batch entry at the end of the day) at multiple stations is a necessity in your practice should a network be considered.

Generally speaking, batch processing (the ability to print many forms from a single command) is desirable as are screen formats that allow easy data entry and a logical movement among various "screens." Look for software that allows you to apply credit against a specific line item as opposed to the "balance forward" approach. Patients will want the detailed information. Although a software demonstration might be unavailable, it is always desirable.

Remember no vendor will demonstrate the bad side of software. A better source of information is another physician who uses the software.

Focusing on computer speed is a mistake when purchasing hardware. Speed in processing takes a back seat to speed in repairing or replacing a failed system. If the vendor talks in days, then leave immediately. You cannot afford "downtime" that puts the burden of catch up on your office staff. It is wise to buy all your hardware (printer, computer, monitor, surge protector) from the same vendor. Then, when any one item malfuctions, which is sure to happen, troubleshooting becomes the vendor's job.

Relative to your strategy, consider other applications you might subsequently add to your hardware system. Determine the cost of these enhancements. Two systems might be identical in price and performance, but future enhancements for one might be costlier than for the other. Also, you might consider buying two printers to save your staff time in changing between different types of forms when printing. The initial higher cost might prove cheaper over time. In any event, purchase software and hardware to meet your actual needs today and avoid buying promises that too often become tomorrow's disappointments.

Implementation

Identify where you will locate the system in your office. What about electrical outlets? Will you have enough? Four outlets is a good number to start with. Essentially, the implementation process is the junction where the computer adage "Garbage in, garbage out" takes on significance. Use this time to perform an office clean up.

You will be able to resolve and clear credit balances, identify outstanding claims, write off bad debts, and send collectable accounts to a collection agency. In addition, you will want to collect the following items: physician data (tax i.d., social security number, etc.) insurance carrier data, CPT codes (diagnoses and procedure codes and charges).

A frequently forgotten and time-consuming task, yet critical, is the transferring of data to a new office management system. Prior to this process, request on-site preliminary training for your staff. Also, design an input document that conforms to the screen format of your selected software. Your staff should complete a document for each active patient. For this project, set aside additional funds for overtime to allow your staff

ample time to review patient information before data entry. Ideally, the data-entry person should be someone on your staff because "ownership" often improves the accuracy rate.

Perform a "walk through" of an entire cycle: entering fictional patients for the test, performing reports, and printing forms. Identify and eliminate problems now because once you are working with real data, a computer will multiply an error at an alarming rate.

Phase in new tasks one by one to avoid overloading your staff. For at least two months, your staff ought to maintain the manual along with the automated system. This "parallel run" serves as an auditing feature to find and resolve problems. To skip this process often causes major headaches. Target a date, preferably at the beginning of a new month, when you will discontinue the "parallel run."

Review the duties your accountant performs, decide whether to expand or reduce them and request a new engagement letter to reflect changes. Notifying your insurance company of your equipment models and serial numbers is another often-forgotten administrative task. As an added precaution, take photos of your equipment and store them in a safe place.

Buying a service agreement (a form of insurance) for the hardware (preferably on site) and software is added protection. Purchasing your software locally provides you with another place to call when a telephone consultation cannot resolve your problem. Of course, no amount of protection can replace the need for good training: initial, follow-up, and on-going. Proper training builds staff confidence in the capability of the PMS to do its job and in your staff's ability to use the hardware and software. This confidence creates an easier transition to the new automated procedures and produces benefits that will flow to other areas of your practice such as happier patients, more timely payments, and faster alerts.

Conclusion

Automation involves considerable change, and change is difficult, which might mean incurring your staff's displeasure. Resignations or dismissals are possibilities. For the long-term, however, you will see improvements. The ease in automating your office depends on many variables, but its success depends largely on your ability to work with your staff in planning, managing, and using the new tool.

As the system's owner, allow computerization to work for you by reviewing it and learning how to "manage" it to help shape the changing structure and strategy of your practice. This will go a long way toward shaping up your practice to meet the demands of the 1990s.

Some food for thought. . .

There's much more to reducing nutritional risk factors than giving your patient a pep talk and a printed diet.

Now you can refer your high-risk patients for excellent professional nutritional guidance and support.

Highlights: Executive Committee and Council Actions

Executive Committee - September 22, 1988

Minutes The Executive Committee approved minutes of the following meetings as distributed:

Executive Committee, Thursday, August 18, 1988

House of Delegates, April 27 and 29, 1988

Insurance Committee Report Dr. Yosuico reported that the Med Chi Insurance Committee at its meeting on September 20, 1988 endorsed Medical Mutual as the recognized professional liability insurance carrier in State of Maryland. Following discussion of the issue, the Executive Committee agreed to forward its recommendation of endorsement of Medical Mutual to Council, subject to review by legal counsel.

Emergency Care - Prepaid Health Plans As a result of complaints raised by emergency room physicians and problems encountered in their relationship with HMOs, at the request of the Faculty President, the Committee on Third Party Carriers agreed to change its purpose and function to address the HMO matter. The designation of the committee will be changed to the Liaison Committee to Managed Care Programs. The Executive Committee concurred, and the issue will be forwarded to the Bylaws Committee for consideration and presentation at the House of Delegates meeting in April 1989.

Professional Ethics Committee The Executive Committee reviewed the following policy statement on "Discrimination" as requested by the Professional Ethics Committee:

Discrimination:

(d) The Faculty is unalterably opposed to the denial of membership privileges and responsibilities in component medical societies to any duly licensed or qualified physician because of race, color, religion, ethnic origin, a handicapping condition, sex, or national origin; and

(e) The Faculty calls upon all component societies and all individual members to exert every effort to end every instance in which such equal rights, privileges, or responsibilities are denied. (MC 7/12/65; Compendium Revision 1984)

(f) The component medical society is obligated to consider all applications for membership on an equal basis unless there is documented proof of the applicant's unworthiness for membership. (MC 3/12/68)

Following discussion, the Executive Committee adopted a motion to delete Item (e) of the statement and directed that this recommendation be forwarded to Council for approval.

PQAB - PBJ Ruling A petition of the Board of Physician Quality Assurance for a Declaratory Ruling regarding automatic suspension or revocation of a physician's license in PBJ (Probation Before Judgment) was presented and accepted as information by the Executive Committee.

Physician Rehabilitation Loan Program The Physician Rehabilitation Treatment Loan Agreement was reviewed by the Executive Committee, and staff reported that several physicians had begun to repay their loans acquired through the Physician Rehabilitation program. It also was reported that the Ad Hoc Committee will present its recommendations on the following issues to Council on September 24, 1988: (a) should physicians who are not members of Med-Chi participate in the benefits of the Physician Rehabilitation Committee functions? and (b) should such participation include receiving loan monies for treatment and other purposes?

Emeritus Members Voting Rights A recommendation that Emeritus Members of the Council be interpreted as having a vote on the Council was approved by the Executive Committee. This matter will be forwarded to the Council with a recommendation for approval for consideration at its meeting on September 24, 1988.

Med Chi Committee Chairpersons' Meeting Dr. Dobridge reported on the meeting of Med Chi's chairpersons held on September 10, 1988 for the purpose of improving communications between the committees and to discuss the goals for the coming year. Dr. Dobridge recommended this activity be continued during the next presidential term.

Emergency Medical Services Protocol A report of the Committee on Emergency Medical Services addressing the issues of state protocols and the involvement of the private physician in cases of prehospital care was reviewed by the Executive Committee. Following a lengthy discussion, it was agreed that further clarification from the EMS Committee was needed before involvement from Med-Chi is initiated. The issue was tabled until the October 20, 1988 meeting of the Executive Committee.

Princeton Advertising Update The Executive Committee was advised that the Harjes Insurance Agency had submitted an ad for Princeton Insurance to the *Maryland Medical Journal.* Harjes had been asked to clarify certain terminology used in the ad before its acceptance. A letter covering the points raised by the *Journal* was submitted. In addition, Harjes' attorney indicated that a refusal or delay in printing the ad would result in a suit against the *Journal* alleging restraint of trade. Following discussion, the Executive Committee directed that a letter be sent to the State Insurance Commissioner for comment as to whether Harjes appropriately responded to the questions posed by the *Journal.*

MMPAC The question of the inclusion of Auxiliary PAC dues as a line item on the physicians' annual dues bill was presented to the Executive Committee for consideration. Following a lengthy discussion, it was decided not to accept this recommendation for this billing year.

RCTS (Registered Care Technologists) An update on a recent meeting with the nursing community revealed that the nurses are pleased that Med Chi was not sponsoring the AMA RCT proposal. They were assured that Med Chi will continue to work with them

through the nursing crisis and were advised that a nursing resolution would be considered by the House of Delegates on September 24, 1988 in support of possible resolution of the nursing shortage.

Medical Waste Emergency Regulations The Committee was briefed on the medical waste emergency regulations which are scheduled to become effective October 1, 1988. The regulations would place a burden on physicians, that is, additional recordkeeping, arangement for transportation of medical waste to off-site locations, filing of reports to the appropriate environmental agencies. The Committee was assured every effort would be made to delay the implementation of the regulations.

Executive Session Review of the financial status of Med Chi was accomplished and role responsibilities clarified.

Addendum

Telecon 10/4/88 - Mandated Medicare Assignment

On this date, a telephone conversation was held with members of the Executive Committee to review the House of Delegates motion regarding polling the membership for a position on Mandated Medicare Assignment/means test. The Committee agreed on the wording of the motion and authorized correspondence to be sent to component medical societies, *et al.*, notifying them of a special meeting of the House of Delegates to be held at 9 a.m. on Saturday, November 19, 1988, at which time this singular agenda item will be presented to the House.

Council - September 24, 1988

Minutes Minutes of Council and Executive Committee were acted upon as follows:

Minutes approved: Council, Saturday, May 21, 1988

Minutes accepted: Executive Committee, June 16, 1988

Executive Committee, July 21, 1988

Executive Committee, August 18, 1988

Emeritus Membership Council approved the following members for Emeritus Membership, at the request of the component society indicated:

Allegany County
Martin M. Rothstein MD, Frostburg

Baltimore City
Thomas B. Connor MD, Baltimore
Sze-Jui Liu MD, Baltimore

Baltimore County
Thomas M. Holcomb MD, Timonium
Keith A. Manley MD, Lutherville
Lawrence F. Misanik MD, Baltimore
Geary L. Stonesifer MD, Baltimore

Carroll County
Richard Y. Dalrymple MD, Westminister

Harford County
Mary V. Barstow MD, Bel Air
Barry J. Plunkett MD, Aberdeen

Montgomery County
James R. Coleman MD, Wheaton
Jean Feys MD, Silver Spring
Vincent L. O'Donnell MD, Wheaton
Leonard T. Peterson MD, Bethesda
Nicholas G. Pistolas MD, Silver Spring
Norman H. Rubenstein MD, Silver Spring
Teresa S. Spindel MD, Rockville
Francis J. Troendle MD, Rockville
Yilmaz Yamaner MD, Potomac

Prince George's County
Carl J. Houmann MD, Riverdale
Bruno Kolega MD, Camp Springs

Wicomico County
Walter D. DeVault MD, Salisbury
Leonid V. Maldve MD, Salisbury
Raymond M. Yow MD, Salisbury

This information will be forwarded to the House of Delegates with a recommendation for approval.

Dues Waiver Council approved a 1988 dues waiver for the following physicians at the request of the component societies indicated:

Baltimore City
F. Joseph Dagher MD, Baltimore
Miles G. Harrison, Jr., MD, Baltimore

Baltimore County
C. Edmund Rybczynski MD, Baltimore

Montgomery County
Rolf Nieman MD, Silver Spring
T. James Waters MD, Towson

Professional Ethics Committee The following ethical and policy statements were presented by Dr. Louis C. Breschi, Chairman of the Professional Ethics Committee. After discussion, the Council acted on each policy as follows:

MD or DO Assistant's Fee - APPROVED It is ethically permissible for a physician to engage an MD or DO assistant, if the assistance of an MD or DO assistant is in the best interest of the patient. This principle applies whether or not a third-party payor covers this service. The attending physician should inform the patient in advance of the importance of a MD or DO assistant and the fact that the patient may be billed for the MD or DO assistant's fee. In circumstances in which there is an emergency and the informing of the patient is not possible, it would be appropriate for an assisting physician to bill the patient if the third-party payor denies the claim. It is ethically permissible in certain circumstances for a physician to engage other physicians to assist him in the performance of a procedure and to pay a reasonable amount for such assistance, provided the nature of the financial arrangement is made known to the patient. This principle applies whether or not the assisting physician is the referring physician.

Medical Partnerships Between Physician and Non-Physicians - APPROVED Partnership agreements may not be made between physicians and nonphysicians.

Bank Cards - APPROVED The Faculty recom-

mends the following principles be considered before developing a bank card plan:

a. The Faculty discourages participation in any plan exploits or capitalizes on participation by physicians in that plan.

b. Physicians are encouraged to continue the traditional practice of permitting patients of limited means to pay relatively large fees in installments without interest arrying charges. It is unethical for physicians using bank card plans to increase fees for medical services because of this participation, but instead to view such a bank card plan as a convenience for the patient.

c. Delete: The Faculty suggests that plaques or other devices indicating participation in the plan within the physician's office be kept to a discreet and dignified minimum.

Charging Interest on Past Due Accounts - APPROVED c. It is also recommended that prior to administering such an interest charge, the patient be given a reasonable time in which to make payment. Such reasonable time could be set at a 60-day period after receipt of the bill.

Status of "Precare" Program A booklet describing the "PreCare" (Physician Referral for Elder Care) was distributed Council members, and Dr. Lee- Llacer informed Council that a letter of support had been received from Governor Schaefer. Dr. Dobridge took this opportunity to inform the Council that the present budget figure of $50,000 for the total government relations program may be insufficient and will require review for the 1989 budget.

Membership Incentive Program On recommendation of the Executive Committee, the Council approved a motion to implement a two-year membership recruitment demonstration project that will provide monetary credit to Med Chi members who recruit physicians into the society.

Editor of Maryland Medical Journal Council approved the motion to elect Dr. Victor Hrehorovich to the position of Editor for the *Maryland Medical Journal* due to the retirement of Dr. James Zimmerly as Editor. A plaque will be presented to Dr. Zimmerly to commemorate his achievements as Editor.

Physician Rehabilitation Loan Program The following motions presented by Dr. Louis Breschi, Chairman of the Ad Hoc Committee charged with the responsibility to study the issues, were approved by the Council:

(a) Physicians who are not members of Med-Chi can participate in the benefits of the Physician Rehabilitation Committee functions; and

(b) Such participation will include receiving loan monies for treatment and other purposes.

Emeritus Members Voting Rights Dr. Dobridge stated that the Executive Committee had reviewed the issue of voting privileges of Emeritus Members on the Council and took the position that all councilors elected by their component societies should have voting privileges in the Council and, further, recommended that this issue be referred to the Bylaws Committee for action. The Council approved the recommendation of the Executive Committee, and the matter will be forwarded to the Bylaws Committee for review, action, and presentation to the House of Delegates in April 1989.

Insurance Committee Report (Medical Mutual) Dr. Jose Yosuico, Chairman of the Med-Chi Insurance Fund Committee, reported that the Executive Committee had adopted unanimously a motion to endorse Medical Mutual as the insurer for professional liability insurance for the physicians in the State of Maryland.

Discussion revealed that physician subscribers to Medical Mutual were pleased with the personal service provided by Med Mutual when questions arose regarding their professional liability insurance, and it was the consensus that communications had much improved during the past year. Following the discussion, Council adopted the motion of the Executive Committee, endorsing Med Mutual as the insurance company for the physicians of Maryland. Dr. Raymond Yow, Chairman of the Med-Mutual Board of Directors, and Mr. David Murray, President of Med Mutual, were introduced and expressed appreciation for the support of the Council.

Report on Past Resolutions Dr. Lee-Llacer reported on various resolutions adopted during the past year, stating that letters of support on the tobacco resolutions had been received from Governor Schaefer, the Boards of Education throughout the state, as well as other organizations. He also stated that Maryland's resolution adopted by the AMA on the physician discipline reporting issue will serve to clarify the distortion of information provided to the public through the Federation of State Medical Boards publication.

PQAB - PBJ Ruling Dr. Lee-Llacer reported that because the wording in the Maryland law (SB 508) on the Physician Quality Assurance Board required clarification, a petition had been filed with the Board for a declaratory ruling regarding automatic suspension or revocation of a physician's license in Probation before Judgment (PBJ) cases.

Publication of Discipline Commission Actions A letter recently received from a physician expressing his concern on the publication of "findings of fact" in the *Maryland Medical Journal* was discussed.

Dr. Lee-Llacer stated this issue had been before Council three times in the past, and each time Council supported the continuance of publication of disciplinary actions in the *Journal*. On recommendation of Dr. Lee-Llacer and there being no objection, the publication of disciplinary actions in the *Journal* will remain in effect.

Medicaid Program - Emergency Room/OPD Diversion of Services Plan Dr. Dobridge informed the Council on the status of Medicaid's plan to divert emergency patients, classified as nonemergency, to an outpatient setting or private physician's office for treatment. Hospitals will not be reimbursed for those visits not deemed "emergencies." The implementation date, originally targeted for October 1, 1988, has been delayed until January 1, 1989.

Mandated Medicare Assignment - Means Test Dr. Israel Weiner, Chairman of the Legislative Committee, addressed Council on mandated Medicare Assignment Means Test. After much discussion, the Council approved a recommendation to place this topic on the agenda for the House of Delegates' meeting this afternoon.

Medical Waste Emergency Regulations Gerry Evans reported on medical waste emergency regulations of the Department of Environmental Affairs received within the past week. In summary, private physician offices will be classified as "generators" and will be required to meet these regulations for the disposal of medical waste. The implementation date for these regulations is October 1, 1988; however, every effort will be made to delay its implementation.

Building Committee Report Dr. George Malouf, Chairman of the Building Committee, reported on the status and completion of the latest building project, specifically the rededication of the Faculty Library scheduled for today. He further stated that the Faculty is actively pursuing the possibility of purchasing office space in Annapolis.

Dr. Dobridge extended congratulations to the committee for their services and excellent job in the completion of the building project.

A tradition of home care excellence 'for over 90 years.

Providing a comprehensive range of home health care services.

Medicine in the 1990's, are you ready? Are you looking for new career challenges? George Washington University's Master of Public Health program serves the needs of clinicians entering a new era in medicine — an era in which skills in epidemiology-preventive medicine, administrative medicine, and occupational-environmental health are important for professional development. Set at the crossroads of academic clinical medicine, a major university, and the public health community of Washington, the program offers part- and full-time programs with weekday evening and Saturday morning classes.
For more information, write or call GWU-MPH Program, 2300 Eye Street NW, PO Box 32, Washington, DC 20037; (202) 994-2807.

Marketing That Means Business!

Hoover Anwar Associates is a full service professional marketing organization serving the Medical community. We design marketing programs to build and maintain your patient base and ensure the revenue you require.

We specialize in:
- Marketing Plans
- Public Relations
- Brochures, Newsletters, Direct Mail
- Demographic and Market Research
- Location and Competition Assessment
- Patient Satisfaction and Attraction
- Referral Development

MED PAY *Announces Insurance Processing Breakthrough*

"Physicians Receive Payment Today For Patients Seen Yesterday"

The **MED**ical **PAY**ment Services of Maryland, Inc. program has completely changed the way physicians receive their hard earned fees. The doctor turns over all insurance claims and patient billings for processing by **MED PAY. MED PAY** does all of the rest. In turn, the doctor receives payment today for patients seen yesterday. It really is just that simple.

We know that this may sound too good to be true. So let us prove to you how this unique program can make a dramatic difference to the physician, their practice, and their patients. To set up an appointment for more information, call **882-5050.**

MED PAY is cost effective — especially for smaller practices of 1–5 physicians

MEDical **PAY**ment Services of Maryland, Inc. -18 Stream Run Ct. • Timonium, Maryland 21093

Miscellaneous Meetings

Jan 21 Tenth Anniversary Conference: Daycare in the 90s: A Controversial Reality, sponsored by the Maryland Interdisciplinary Council for Children and Adolescents, held in the Ford Bldg of the Sheppard & Enoch Pratt Hospital from 9 a.m. to 12:30 p.m. (snow date is January 28). Registration requests: Dr. O.M. Taube, Program Chairperson, Greenspring Pediatric Associates, Sinai Hospital of Baltimore, 5105 Lanier Ave., Baltimore, MD 21215 (301-578-5800).

Feb 3-5 Advanced Trauma Life Support Instructor Course, Washington, DC. American College of Surgeons DC Committee on Trauma. Fee: $600; 26 Cat I credits. Info: D. Soto 202-784-2074.

Mar 6-8 NIH Consensus Development Conference: Therapeutic Endoscopy and Bleeding Ulcers, Warren Grant Magnuson Clinical Center, NIH, Bethesda. CME credit offered. Info: Endoscopy, Office of Medical Applications of Research, NIH, Bldg 1, Rm 216, 9000 Rockville Pike, Bethesdsa, MD 20892.

Mar 31 - Apr 2 Symposium: Psychiatry '89, Past Reflections - Future Visions, Stouffer Inner Harbor Hotel, Baltimore, sponsored by Taylor Manor Hospital. Info: 301-465-3322.

Apr 12-16 Third Annual Course in Critical Care Medicine, Center for Bio-Medical Communication in cooperation with Dept of Critical Care Medicine NIH, to be held at Crowne Plaza Hotel in Rockville, MD. Fee: $595 before Feb 1, $695 thereafter; reduced rates available to physicians-in-training and allied professionals. Info: S. Lisanti, Center for Bio-Medical Communication, 491 Grand Ave, Englewood, NJ 07631 (201-385-1808).

• • •

The Johns Hopkins Medical Institutions

All courses at the Turner Auditorium unless otherwise indicated. Sponsored Continued Education Activities for 1988-1989. Info: Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Baltimore, MD 21205 (301-955-5880).

Mar 6-8; Jun 19-21 An Advanced Pediatric Life Support Course. Fee: $445; 20 AMA Cat I credits. Enrollment will be limited. Info: C. Goodell 301-955-2959.

Mar 13-15 Spectrum of Developmental Disabilities XI - Dyslexia: Clinical and Research Issues, sponsored by the Society for Developmental Pediatrics, The Kennedy Fellows Association; The Kennedy Institute for Handicapped Children, and the Johns Hopkins Medical Insitutions. Fee: $350; 20 AMA Cat I credits, 20 Cat A credits for psychologists, 2.0 CEUs. Info: C. Kearney 301-955-2959.

Mar 16-18 PET: Imaging of Brain Chemistry with special emphasis on PET as a Clincal Tool in Neurology, Psychiatry, and Neurosurgery. Fee: $390 physicians, $290 residents; 14 AMA Cat I credits. Info: J. Liston 301-955-2959 or J. Buchanan 301-955-8582.

Apr 4-5 In Vitro Toxicology - New Directions. Fee: $250 before Mar 3, $300 thereafter; 14 AMA Cat I credits or 1.4 CEU. Info: C. Kearney 301-955-2959.

May 8-13 Topics in Clinical Medicine. Fee: $630 physicians, $450 residents/PAs and nurse practitioners; 40 AMA Cat I credits. Info: C. Kearney 301-955-2959.

Jun 11-15 VII ISIAN: International Symposium on Infection and Allergy of the Nose - Interational Rhinology Conference, Stouffer Harborplace Hotel, Baltimore. Fee: before Feb 1 - $425 physicans, $300 residents & fellows, thereafter - $475 physicians, $350 residents & fellows; AMA Cat I credit will be available. Info: Congress Secretariat 302-955-2959.

Jun 30 The Retinal Vascular Centyer 19th Anniversary Meeting - Macula, The Wilmer Ophthalmological Institute. Fee: $200, $100 (those in training); 8 AMA Cat I credits. Info: D. Heydinger 301-955-2959.

30th Annual Postgraduate Institute for Pathologists in Clinical Cytopathology, solely for Board Certified (or qualified) pathologists as a subspecialty residency. 152 AMA Cat I credits in two courses, **both of which must be taken**.

Feb-Apr Home Study Course A - personal reading and microscopic study at own lab in preparation for Course B.

Apr 24-May 5 In-residence Course B, lecture series, laboratory study, and clinical experience at The Johns Hopkins Medical Institutions, Baltimore.

Loan slide set with texts (Course A) will be sent each participant within the US and Canada for home study during Feb-Apr preceding Course B in Baltimore, Apr 25-May 5. Participants *outside* the US and Canada must make arrangements to study Course A before Course B. *The entire course is given in English.*

Application and preregistration advised ASAP: preregistration must be completed **before Mar 24, 1989**, unless by special arrangement. Info: J.K. Frost MD, 604 Pathology Bldg, The Johns Hopkins Hospital, Baltimore, MD 21205 USA.

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: C. Jarvic 301-955-8450.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $460; 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly

programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169.

University of Maryland

CME Courses: For each course additional informa Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, MD 21201 (301-328-3956).

Jan 19-20 Behavioral and Developmental Problems in the School-Age Child, Fee: $150; 11 AMA Cat I credits.

Jan 25 Dean's Conference #5: Psychiatry, UMAB. Fee: $25; 6 AMA Cat I credits.

Feb 23 Dean's Conference #6: TBA, UMAB. Fee: $25.

Mar 3-4 Third Symposium on Urologic Cancer and Surgery, Omni International Hotel, Baltimore. Fee: $175; 10 AMA Cat I credits.

Mar 23 Dean's Conference #7: Preventive and Family Medicine, UMAB. Fee: $25; 5.5 AMA Cat I credits.

Apr 26 Dean's Conference #8: Topics in Surgery, UMAB. Fee: $25; 5.5 AMA Cat I credits.

Jun 1-4 Second Annual Trauma Anesthesia and Critical Care Symposium, sponsored by the Maryland Insitute for Emergency Medical Services Systems. Info: MIEMSS, Dept of International Development, 11 South Paca St. - Ste 303, Baltimore, MD 21201 (301-328-2399).

Visiting Professor Program - Directory of speakers and topics available for area hospitals and other health care organizations. No administrative fee. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunity for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Direct all inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentation hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

In moderate depression and anxiety

- 74% of patients experienced improved sleep after the first *h.s.* dose[1]
- First-week improvement in somatic symptoms[1]
- 50% greater improvement with Limbitrol in the first week than with amitriptyline alone[2]

Protect Your Prescribing Decision: Specify "Do not substitute."

Limbitrol®

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) Ⓒ IV

Limbitrol® DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) Ⓒ IV

References: 1. Data on file, Hoffmann-La Roche Inc., Nutley, NJ. 2. Feighner VP, *et al: Psychopharmacology 61:*217-225, Mar 22, 1979.

Limbitrol®Ⓒ
Tranquilizer—Antidepressant
Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (*e.g.,* operating machinery, driving).

***Usage in Pregnancy:* Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.**

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: *Cardiovascular:* Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. *Psychiatric:* Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. *Neurologic:* Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. *Anticholinergic:* Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. *Allergic:* Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus. *Hematologic:* Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. *Gastrointestinal:* Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. *Endocrine:* Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. *Other:* Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: *Double strength (DS) Tablets,* white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and *Tablets,* blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

Meridian wants you to know

What you should know about Meridian Healthcare services and facilities.

Meridian Healthcare is Maryland's largest provider of long-term nursing care. We operate eighteen Meridian Nursing Centers throughout the state, including Meridian Multi-Medical, a unique nursing center with many sub-acute-care services.

We offer rehabilitative services, such as occupational, physical and speech therapy, short-term, or "respite" care, as well as long-term residency in bright, modern surroundings.

Meridian has prepared a referral information kit detailing our facilities and services. In it you will find a digest of our services and information on how you and your patients' families can take advantage of them. Each of our eighteen centers is profiled in a manner structured to aid you in helping your patients and families with selecting a nursing center.

This kit is available without charge to physicians and hospital administrations. To obtain a copy for your office, please call or use the coupon below.

Salmonella enteritidis and Grade A Shell Eggs

Salmonella enteritidis (SE) has become the second most common *Salmonella* serotype reported nationally. In the northeast and mid-Atlantic states, the isolation rates of SE have increased greatly over the past five to ten years (Figure 1). In Maryland, SE has gone from 6.2% of isolates in 1981, to 29.4%, and 26.5% in the years 1986, and 1987 respectively; SE was the most common serotype identified in Maryland in these years.

The Centers for Disease Control (CDC) analyzed data from 65 reported outbreaks of SE between January 1985 and May 1987. Twenty-seven (77%) of the 35 outbreaks with identified food vehicles were caused by Grade A shell eggs or foods that contained such eggs (JAMA 1988; 259:2103-7). Continuing association between SE and Grade A shell eggs has been documented in recent outbreaks in New Jersey and New York (MMWR 1988; 37:490,495-6). In Maryland in 1987 and 1988, five of 15 outbreaks of SE had eggs or egg-

FIGURE 1. Isolation rates of *Salmonella enteritidis*, by region — United States, 1976–1987

containing products as the epidemiologically implicated vehicle.

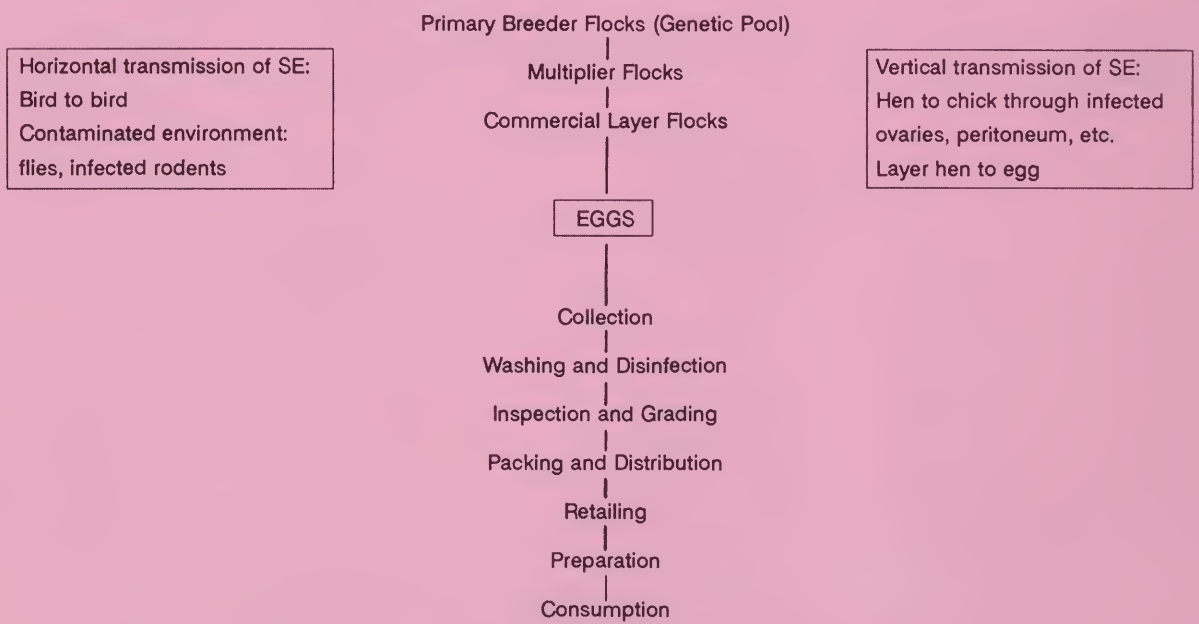

Figure 2 traces the path from the source of layer chickens at the Primary Breeder flocks, through the Multiplier and Commercial flocks, to freshly laid eggs, and to the final steps between egg production and the consumer. Infection of the layer chickens can occur through horizontal or vertical transmission. Infected eggs are still uncommon (1 infected egg of 200 eggs laid by an infected chicken, or an estimated 1 in 10,000 eggs, overall), but steps are necessary to lower the risk of transmission in order to protect the public.

Previous studies have documented that soft boiled eggs, soft poached eggs and "sunnyside" eggs do not reach high enough temperatures for sufficient time to kill *Salmonella.*

CONTROL MEASURES FOR FLOCKS AND EGGS PRIOR TO CONSUMPTION

A Joint Order signed by the Secretaries of the Maryland Dept. of Agriculture and the Dept. of Health and Mental Hygiene became effective on January 1, 1989. The Order requires that all eggs, hatching eggs, and birds for production that are produced, imported, distributed, or sold in Maryland must come from flocks whose owners have provided documentation of adequate testing or of approved origin. This certification may be based upon environmental testing, or serologic test-

Figure 2. *Salmonella enteritidis* **in Eggs: From Chicken to Consumer**

ing of a statistical sample of each flock or upon proof that the flock originated from breeder flocks meeting a similar testing standard. If antibody positive birds are found, the reactors' tissues are cultured for SE. Eggs from flocks found to be culture positive for SE must be pasteurized if they are to be offered for human consumption in Maryland. These Departments are now drafting additional standards aimed at controlling SE in eggs.

The Order and draft standards are consistent with a Model State Program for SE Quality Assurance that has been developed with the support of the FDA, USDA, and the CDC. The program provides for standardized testing, culturing, and control measures.

CONTROL MEASURES FOR FOOD SERVICE IN NURSING HOMES, HOSPITALS, AND FOR THE ELDERLY

The CDC has recently reviewed 18 reported outbreaks of SE infection which occurred in nursing homes and hospitals between 1985 and 1988 (CDC letter to State Epidemiologists, January, 1989). The outbreaks affected 658 persons with 24 deaths (3.6% case fatality rate). An egg or egg-associated vehicle was found in eight of the 18 outbreaks, accounting for 477 cases. Two outbreaks were associated with raw eggs (one used raw eggs in a mayonnaise substitute, and one added raw eggs to hot cereal), three were associated with undercooked scrambled eggs, and three were associated with pureed foods where cross-contamination with raw eggs in a blender was likely.

Menus, recipes, special diets, and food handling practices should be reviewed and modified to prevent the elderly from being exposed to raw and undercooked eggs. The following points merit special emphasis to reduce the risk of institutional outbreaks:

- The safest alternative to fresh shell eggs is to use pasteurized liquid egg products for all recipes calling for bulk pooled eggs. Pasteurized egg is commercially available in 10 pound containers.

- Foods in which eggs are eaten raw are particularly hazardous. These include "homemade" eggnog, mayonnaise, ice cream, hollandaise sauce, and Caesar salads which use raw eggs as an ingredient, or any cooked foods to which raw eggs are added.

- A large pool of eggs may become contaminated by a single infected egg. Practices which result in large pools of whole eggs, egg whites, or egg yolks, cracked ahead of time and held in a large container before cooking are of particular concern. Rapid bacterial growth may occur if the pool is held unrefrigerated. Careful attention to holding temperatures and times, and to thorough cooking is essential.

- Cross-contamination between raw eggs and pureed foods in blenders must be prevented by routine disassembly and

sanitization after blending raw eggs, or by using separate blenders for raw eggs.

CONTROL MEASURES FOR THE PUBLIC

Consumers should:

- Refrigerate eggs at home in their original carton as soon as possible. Do not wash eggs before storing them or using them.

- Cook eggs and egg-containing foods until well done. The yolk and white should both be firm, not runny.

- Avoid eating foods or drinks containing raw or undercooked eggs (home-made eggnog, home-made mayonnaise, home-made ice cream containing raw eggs, hollandaise sauce, Caesar salads, uncooked cookie and cake batter, etc.). Commercial forms of such foods are safe *if* they are made from pasteurized eggs.

- Use special care to thoroughly cook eggs or egg-containing foods served to the elderly, infants, or to other people at high risk of *Salmonella* infections.

- Use Grade AA or A eggs with clean uncracked shells.

- Use raw shell eggs within 5 weeks and hard-cooked eggs within 1 week. Use leftover yolks and whites within 4 days.

- Serve cooked eggs and egg-rich foods immediately after cooking, or refrigerate at once for serving later. Use within 3-4 days.

- (Pasteurized egg products are not available to the non-commercial consumer at this time.)

(Ref. "Consumer Bulletin," USDA, FDA, September, 1988)

SURVEILLANCE AND REPORTING

Patients with diarrhea in whom the physician suspects salmonellosis should be cultured and questioned about possible sources of infection. Cases of salmonellosis, regardless of serotype, are reportable to your local health department or to the state Surveillance Division (301-225-6712). Suspected or confirmed outbreaks of any type of *Salmonella* are also reportable to your local health department or the the state Division of Outbreak Control (301- 225-6677). Outbreaks are intensively investigated, and if eggs are implicated, the distributor of the eggs and the source flock are determined and investigated. Information from all such investigations is shared with the CDC as part of the ongoing national surveillance and control effort.

Baltimore Metropolitan Chapter American Diabetes Association

The new Baltimore Metropolitan Chapter of the American Diabetes Association serves the needs of Baltimore County and Baltimore City. Patients and family members are invited to join these functions:

- General Membership meetings, the second Friday of every month at 7:30 p.m. at Eastern Star Lodge, 3 Walnut Avenue, Overlea. Different topics are discussed each month.
- Child and parent support groups meet the fourth Friday of every month at GBMC. Children and parents meet separately for one hour (children 6 to 10 years and partnts at 7 p.m.; teens and parents at 8 p.m).

The Chapter would appreciate your input relative to patient or professional needs. For more information call 301-668-4829.

One Minute with Diabetes

Urine Testing vs Blood Glucose Monitoring

Doctor, my mother had diabetes for 20 years. She tested her urine for glucose regularly. Why is it that you do not want me to do urine testing but insist on self-monitoring of blood glucose? It is more expensive and more painful than urine testing.

There has been a considerable change of opinion as to what is adequate control of diabetes since your mother's era of treatment. In her day, self-monitoring of blood glucose was not available. Many clinicians and patients believed avoiding the extremes of ketoacidosis and hypoglycemia was the acceptable standard of care. Now, only patients who are unwilling or unable to do blood glucose testing should be taught urine glucose testing. Patients need to know that the renal threshold is variable, but as a general rule urine glucose will be positive when blood glucose is greater than 250 mg/dl.

For the urine test to provide the most useful information, patients should be taught to check second voided specimens. The bladder should be emptied, and then a glass or two of water should be drunk. After waiting 15 to 30 minutes, the urine specimen is collected and tested promptly.

It must be remembered that whatever method is used for urine glucose testing, it is only semiquantitative. For example, a 2 percent urine test cannot be accurately correlated with a specific blood glucose. Some tests are designed to be more sensitive than others, and blood chemicals excreted in the urine may affect the accuracy of one or another of the methods of testing for glucose.

The test for urine ketones should be taught as an emergency measure to be done whenever the blood glucose is 240 mg/dl or greater. Acetest Tabs or Ketostix may be used to test for ketonuria. The well-trained diabetic patient will need to use this test infrequently. The individually foil wrapped strips are preferable and have less risk of deterioration and damage. A finding of ketonuria plus hyperglycemia should be reported immediately to the physician.

For accuracy the urine glucose test vs blood glucose monitoring can be roughly compared to checking the temperature of water with a finger vs a thermometer. The instrument reading is certainly more meaningful.

Elder Love - A New Way of Caring

The middle-aged woman hesitates at the open door to the meeting room and glances nervously at the group of 12 men and women seated in a circle in the middle of the floor. A smile and a gesture from the group leader encourage her to enter and to take a seat.

She listens to the discussion, her eyes lowered, for several moments. Suddenly she is being asked to tell her story. She hesitates, then begins an emotional account of her life as caregiver to her aging mother and father. Tears flow, and a gentle hand is placed reassuringly on hers. She is overcome with relief and a feeling of being understood and accepted that she has needed for so long. Elder Love Support Group welcomes a new member.

This scenario, in varying detail, is repeated again and again in the library meeting room in Hagerstown. It is there that Elder Love holds its monthly meetings for caregivers of aging relatives. Organized in October 1986, the group continues to provide much-needed support for an ever-increasing segment of the population.

Washington County Auxilians Roberta (Mrs. Edmund) Niklewski and Marty (Mrs. Hugh) Talton are co-founders of Elder Love. The idea for such a group arose from a personal need. Marty was involved in the long-distance care of a widowed mother and was feeling the frustrations inherent in such an arrangement. "I always felt relieved when I could talk with someone who had cared for an aging parent and could give some perspective to the feelings I was having," Marty related. "If this kind of sharing of experiences could help me, I thought it might benefit others as well." She approached fellow Auxilian, Roberta (Bobbie) Niklewski, who had cared for her mother and mother-in-law, both Alzheimer patients, in her home and knew firsthand the problems and emotions of the caregiving situation. Together Marty and Bobbie agreed that a support group could be an invaluable service to a large number of people in the community; Elder Love was born.

The first task was to establish guidelines and objectives for such a support group. Once the groundwork for the group was laid, it was time to see whether it would work. An ad announcing the formation of the group and the date of the first meeting was placed in the local paper. Bobbie and Marty waited to see if anyone would come. Thirteen people attended that first meeting in October 1986, and many of them are still members of the group.

Caregiving takes many forms. Not all people care for their ill or aging parents in their own homes. Sometimes the parent lives alone, and the caregiver runs errands and looks in daily. In other cases the parent or relative is so ill or incapacitated that he or she must be placed in a nursing home. Some people are "long-distance" caregivers. The common thread is the responsibility and concern that all these caregivers feel for the relative they love. In the Elder Love group there are men and women, mothers and daughters, sisters and brothers, and professional caregivers who drop in occasionally to listen and to give suggestions. Meetings are open to anyone involved with an aging relative. A testimony to the success of the group is the fact that some members continue to attend even after the death of their loved ones because they have formed such close bonds with other group members.

The format of an Elder Love meeting is designed to carry out the objectives set forth for the group: to provide emotional support and practical information to caregivers. Of primary importance is the sharing of concerns and experiences among the members, and ample time is allotted for this exchange at the beginning of each meeting. At times people express anger, guilt, and frustration. Positive suggestions are offered for dealing with these emotions. The open and non-judgmental atmosphere at an Elder Love meeting encourages participation.

The topic is presented by a group facilitator or by a resource person brought in from the community. Resource people give a short presentation and then lead the discussion. Recent topics include: "Warning, Caregiver Needs Help!" "When Is a Nursing Home the Answer?" "Keeping Your Sense of Humor," and "How Would You Like to Be Old?" Resource people have included a lawyer, psychiatrist, social worker, and bereavement counselor. Program plans are published several months in advance. Ideas often come from the membership as they indicate subjects that would be helpful and informative to them.

With her experience in psychiatric nursing, Bobbie often acts as facilitator for the meetings. Marty enjoys the administrative details of the organization. Their individual skills have come together in a very efficient balance.

The Auxiliary to the Washington County Medical Society, The Washington County Commission on Aging, and a local Presbyterian Church are co-sponsors of Elder Love. They supply both monetary and administrative support. The Auxiliary, which has many nurses in its membership, offers respite care in the Elder Love members' home so that they can leave their relatives to attend meetings. Auxiliary members often attend meetings, and some have acted as group facilitators and resource people.

Community response to Elder Love has been encouraging. Attendance at meetings continues to grow and reached 35 or so at a recent meeting. Bobbie and Marty have spoken to several civic organizations in an effort to spread the word about Elder Love, and some of these groups have been most generous in their support of the program. The question the organizers are now facing is "Where do we go from here?"

Auxilary to the Medical and Chirurgical Faculty of the State of Maryland. Mrs. Eva Edmonds President; Mrs. Betty J. Molz Editor.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

The need for caregivers' support groups is certainly not limited to Washington County. Bobbie and Marty look forward to the establishment of new Elder Love groups in neighboring communities, other Maryland cities, and perhaps even nationwide. "We believe the Auxiliary with its superb organization and many capable members might be on vehicle for taking the Elder Love concept to other areas," says Marty. Toward this end, they are working on a caregivers kit that will provide information on a variety of topics from safety in the home to emotional changes in the elderly. They have just completed a slide presentation that gives an overview of Elder Lover and are designing a workshop on "How to Start and Elder Love Chapter in Your Community."

"Things don't always move as quickly as we would like," says Bobbie who has recently been appointed the Nursing Administrator for the newly created Alzheimers and Related Disorders Clinic in Hagerstown," but we will keep spreading the word and hope the program will continue to grow and to reach more people."

The closing of the slide presentation tells the story: Elder Love is meeting the needs of the caregivers and enriching the lives of the aging. For information on Elder Love, write Elder Love, PO Box 2737, Hagerstown, MD 21741-2737.

MARTY TALTON, President
Washington County Auxiliary

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

February 1989

PHYSICIAN PROFILE REVIEW

Recently the Faculty has received inquiries from physician members concerning their "profiles" under BCBS of Maryland. Any physician requesting such a review may write to Cynthia M. Stys, Manager, Professional Contracting and Reimbursement, 700 East Joppa Road, Towson, MD 21204 (301-494-5042). Physicians in Prince George's or Montgomery County who are served by BCBS of the National Capitol Area may call Becky McKay, Professional Services at 202-479-3576 for similar information.

MARYLAND MED SIG BULLETIN BOARD

Med Chi's Public Relations Committee in a cooperative effort with the Committee on Computers has recently designed a new communications service specifically for Med Chi Messages. The service, which will be available to all component societies and member physicians through the Maryland Med Sig computer bulletin board system, will provide announcements as well as updates on programs and events at Med Chi and around the state. In addition, questions or requests for clarification of any announcement may be entered directly into the system, allowing Med Chi to respond to any issue almost immediately. For more information regarding the Maryland Med Sig Bulletin Board System, contact Betsy Newman at 301-539-0872 or 1-800-492-1056.

AMA POLICY ON RBRVS

At its Interim Meeting in Dallas in December, the AMA House of Delegates adopted the position (Report AA), which states that the Harvard RBRVS would be an acceptable foundation for a Medicare indemnity payment system if it is sufficiently expanded and refined. The AMA is working in conjunction with the Physician Payment Review Commission (PPRC) who maintain that they hold the primary responsibility for developing a complete RVS approach for physician payment under Medicare.

WORKERS' COMPENSATION COMMISSION GUIDE

Effective December 15, 1988, the Maryland Workers' Compensation Commission has adopted "Guide for Evaluation of Permanent Impairment." The American Medical Association's "Guides to the Evaluation of Permanent Impairment" (AMA, 2nd ed., 1984) is incorporated into this document. Since the adoption, the AMA's "Guides" was revised (AMA 3rd ed., 1988). The Commission will be making a determination as to how to proceed with the incorporation of this new edition into COMAR.

FLU VACCINES

The Maryland State Health Department plans to educate the physicians and persons over 65 on the use of pneumococcal vaccine. Public health officials are encouraging physicians to offer pneumococcal vaccine along with the influenza vaccine in their offices. Medicare and Medical Assistance will reimburse the cost of pneumococcal vaccine but not the cost of the influenza vaccine. For more information contact Barry Trostel, Department of Health and Mental Hygeine, 301- 225-6677.

PRECARE

PreCare, jointly sponsored by Med Chi, component societies and the Maryland Office on Aging, is a statewide telephone referral service for seniors seeking care on assignment. The program is accepting the names of physicians who do not participate in Medicare assignment physicians but <u>are</u> interested in taking part in PreCare. Any interested physicians should contact Betsy Newman, (301)-539-0872 or 1-800-492-1056.

Farshad Paul Yazdani, MD

In addition, Med Chi wishes to thank the following medical personnel who also volunteered their services:

Ms. Gail Chapin, RN
Gary Fennel, PA
Jay G. Harper, PA
Tony Moreno, PA
Ronald Swain, PA
Rousan Travers, PA
Ms. Lorrick Wong, RN

Quality Practice Digest

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state.

The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

TREATMENT OF CONTAGIOUS PATIENTS

The following ethical opinion was adopted by the Faculty at its November 1987 meeting. The opinion addresses the ethical responsibility of a physician to treat a contagious patient, including AIDS or HIV positive patients.

> A physician may freely choose the patients he wishes to treat. However, fear of contagion should not be the sole reason a physician refuses care. A physician is obligated to render emergency care in situations where other adequate emergency services are not available.
>
> A patient is entitled to freely choose his physician. A patient may abrogate this right by contract.
>
> A patient must also be free to choose the specialist for his treatment. This right may be limited by hospital privileges.
>
> If a physician feels the need to refer a patient or feels incapable of providing adequate care to a patient, the referring physician has a duty to refer the patient to qualified specialists. Should a physician and patient disagree, the physician should explain his choice of referral. However, the choice is ultimately the patient's.

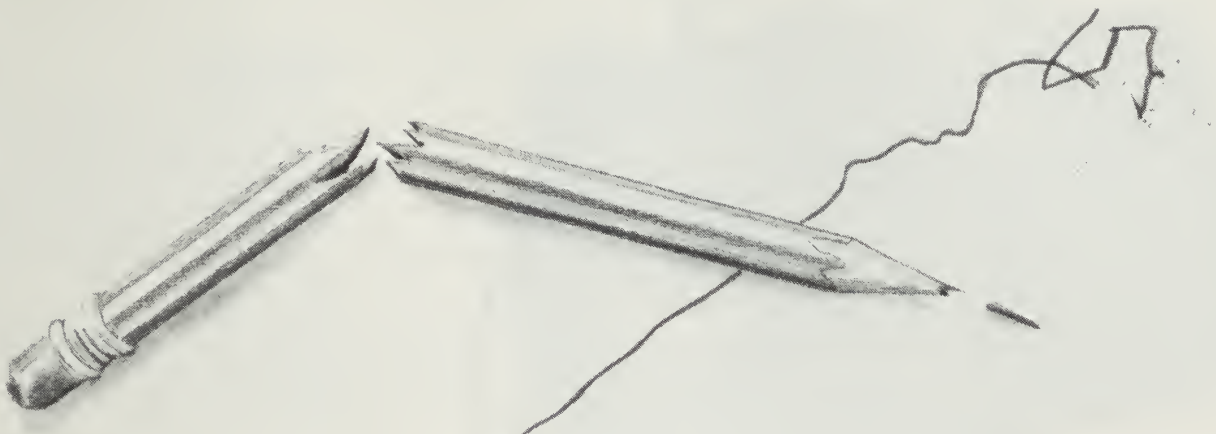
Also in November 1987, the AMA's Council on Ethical and Judicial Affairs released a report on the Ethical Issues Involved in the Growing AIDS Crisis. The report concluded that "A physician may not ethically refuse to treat a patient whose condition is within

the physician's current realm of competence solely because the patient is seropositive [to the AIDS antibody]. Persons who are seropositive should not be subjected to discrimination based on fear or prejudice."

The AMA Council on Ethical and Judicial Affairs also stated that the Council believes that:

- Physicians are dedicated to providing competent medical service with compassion and respect for human dignity.

- Physicians who are unable to provide the services required by AIDS patients should make referrals to those physicians or facilities equipped to provide such services.



- Physicians are ethically obligated to respect the rights of privacy and the confidentiality of AIDS patients and seropositive individuals.

- Where there is no statute that mandates or prohibits the reporting of seropositive individuals to public health authorities and a physician knows that a seropositive individual is endangering a third party, the physician should: (1) attempt to persuade the infected patient to cease endangering the third party; (2) if persuasion fails, notify authorities; and (3) if the authorities take no action, notify the endangered third party.

- A physician who knows that he or she is seropositive should not engage in any activity that creates a risk of transmission of the disease to others.

- A physician who has AIDS or who is seropositive should consult colleagues as to which activities the physician can pursue without creating a risk to patients.

Physicians also need to be aware that not only is there an ethical duty to treat an AIDS or HIV positive person, unless the physician lacks the expertise to do so, but also legally a physician may not discriminate against such a person. In May 1988, the State Commission on Human Relations concluded that the Commission had jurisdiction over dentists and physicians and would investigate allegations of discrimination against health care providers who refuse to treat AIDS patients.

Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors,and members of the ministering profession.

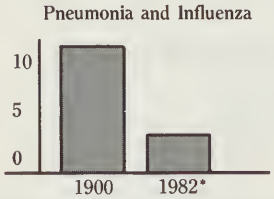
We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **(301) 465-3322 or (202) 621-4965**.

Taylor Manor Hospital

ELLICOTT CITY, MD 21043

(301)465-3322 / (202) 621-4965

CHE



Center for Health Education, Inc.

The Center for Health Education, Inc., a non-profit organization, was established on April 12, 1982 to be a resource to physicians in enhancing their disease prevention and educational skills. CHE originated as a joint venture of the Medical and Chirurgical Faculty of the State of Maryland (Med-Chi, the State Medical Society) and Blue Cross and Blue Shield of Maryland.

The concept for CHE began with Med-Chi physicians who recognize that traditionally, medical education does not emphasize the skills physicians need to successfully educate their patients. This concept was supported by Blue Cross and Blue Shield of Maryland, which acknowledges that successful patient education can have a positive impact on the utilization of health services.

Physicians and Disease Prevention

Physicians have been in the forefront of influencing the dramatic decline in premature deaths caused by infectious diseases.

Physicians can be just as effective today. Perceived by the public as the best and most reliable source of health messages, physicians can have a substantial impact on those lifestyle behaviors which, more so than ever before, significantly contribute to the causes of avoidable morbidity and premature mortality such as heart disease and cancer.

In addition, the physicians are in a position to personalize their advice for the individual patient, as well as reinforce those recommendations over time.

Source: National Center for Health Statistics.

Education for Health

Patient education is a process that provides people with information, encouragement and help in adopting healthful lifestyles and adhering to medical advice.

The use of patient education strategies and techniques can result in:

- increased compliance to medical advice
- positive changes in lifestyle habits
- improved patient satisfaction
- fewer broken appointments
- fewer complaints about medical care

Functions

RESEARCH: Assess physicians' needs in disease prevention and health promotion, their current practices and the obstacles they encounter in the educational process.

DEVELOPMENT: Design physician educational materials and programs to increase physicians' awareness, skills and expertise in patient education.

IMPLEMENTATION: Disseminate materials and conduct Continuing Medical Education programs to assist physicians in educating patients.

Accreditation

CHE has been found to meet the Essentials of Accreditation necessary to grant Continuing Medical Education credits for the American Medical Association's Physician Recognition Award.

Governing Body

CHE is governed by a Board of Directors.

Care of Older Adults

The Center for Health Education, Inc. (CHE) is pleased to present this issue of the *Maryland Medical Journal* on Disease Prevention and Health Promotion in the Care of Older Adults, developed in cooperation with the Geriatric and Gerontology Education and Research Program (GGEAR) of the University of Maryland at Baltimore and Med Chi's Long-term Care and Geriatrics Committee.

With the "graying of America," increased attention is being paid to a variety of disease prevention and health promotion activities including nutrition, dentition, exercise, vision, hearing, and immunization. Since these activities may enhance productivity into later years and extend functional lifespans, they present a challenge to the medical profession.

The implication for greater physician involvement in the education, treatment, and care of older adults is striking. Physicians are in a key position to intervene successfully with this population. While there are barriers to widespread incorporation of prevention in primary care, physicians have the capability to narrow the treatment-prevention gap.

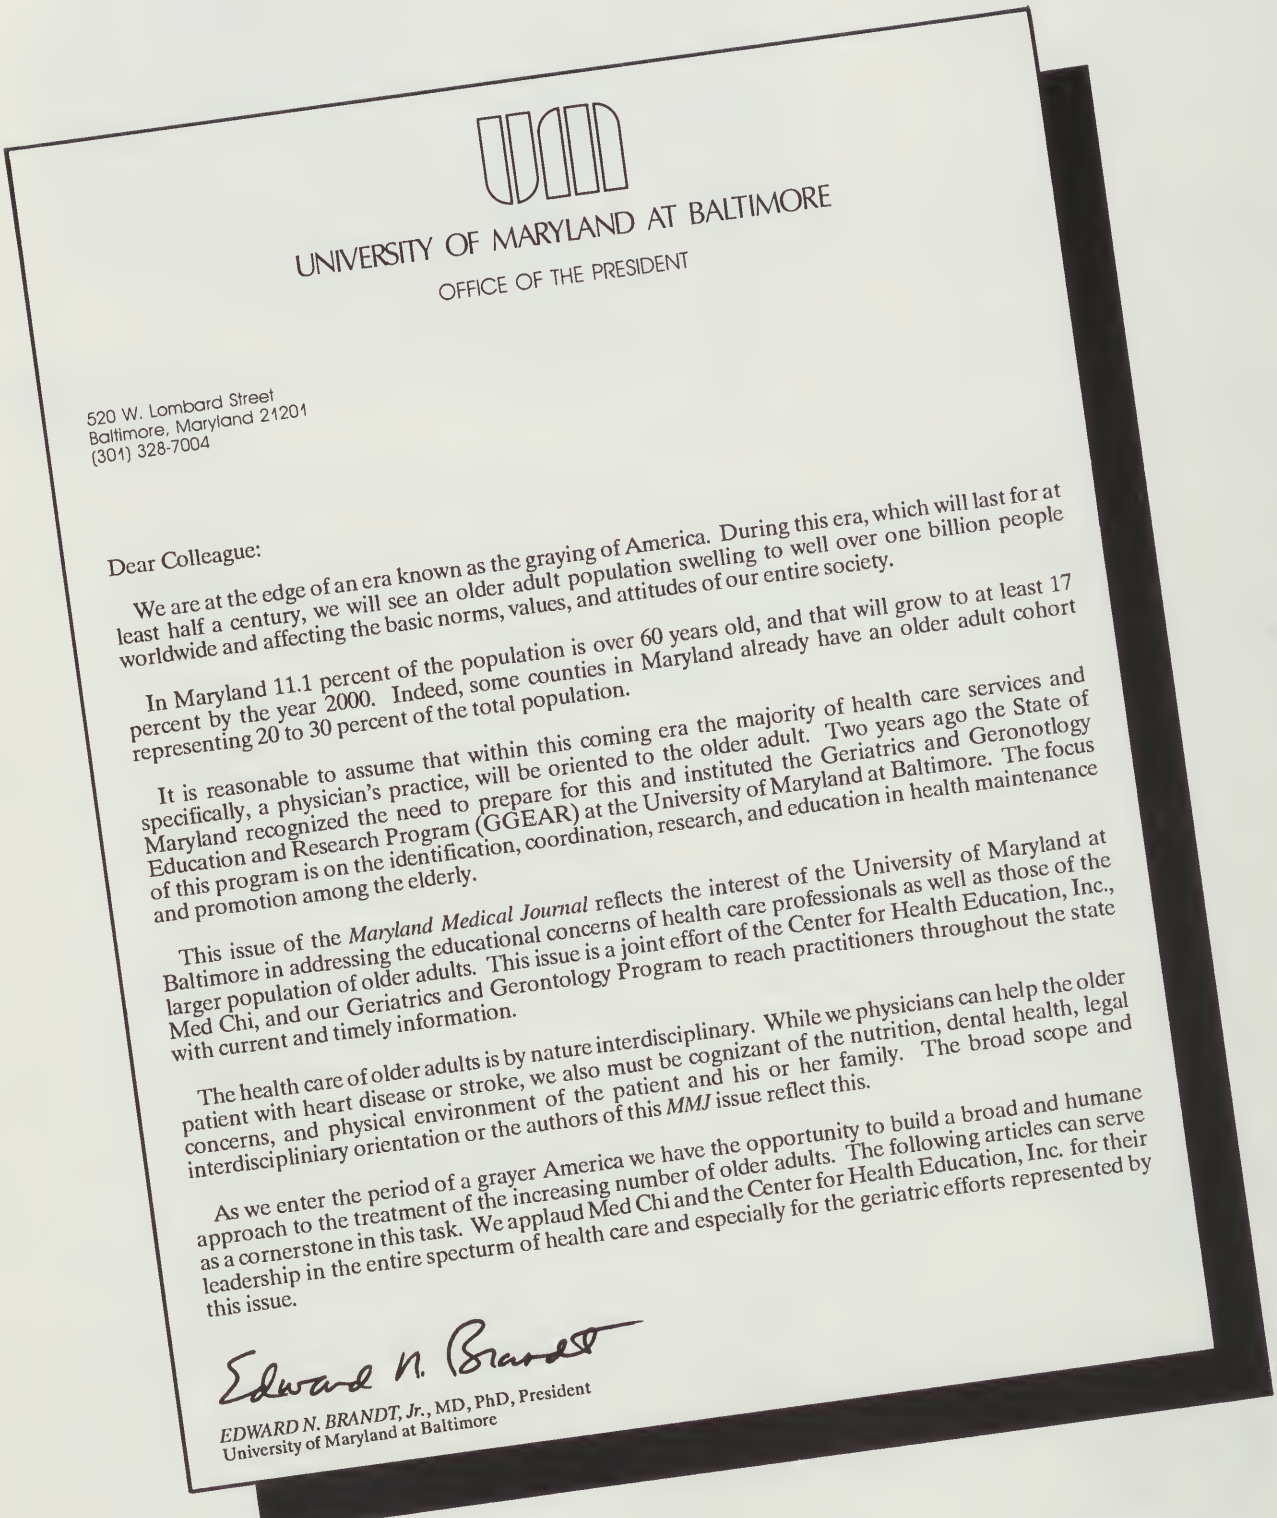
The opening article by Jay Magaziner PhD provides demographic and epidemiological data concerning older adults that highlight the need for community based prevention approaches. Linda P. Fried MD follows with an article on Preventive Practice in Primary Care. The components of recommended health care practice for older adults are reviewed.

A series of specific health maintenance issues with respect to the elderly follow as brief clinical updates.

Peter P. Lamy PhD, ScD follows with an article, "Pharmacotherapeutics in the Elderly," describing prescription drug use and drug use patterns, adverse consequences of polymedicine, types of drug interactions, and factors associated with compliance in the elderly.

The next article, by James P. Richardson MD and colleagues, deals with Rehabilitation in the Elderly.

The concluding article by Diane E. Hoffman JD provides an overview of the Maryland Life Sustaining Procedures Act and Durable Power of Attorney Act and describes their advantages and limitations.



We thank the authors for their contributions and the Geriatric and Gerontology Education and Research Program (GGEAR) for its interest and support in planning this issue. A special thanks to George A. Taler MD and Ann E.K. Page RN, MPH of the GGEAR and to Linda S. Martin, RN, MPH of the Center for Health Education, Inc. for their assistance in the planning and preparation of this issue.

UNIVERSITY OF MARYLAND AT BALTIMORE

OFFICE OF THE PRESIDENT

520 W. Lombard Street
Baltimore, Maryland 21201
(301) 328-7004

Dear Colleague:

We are at the edge of an era known as the graying of America. During this era, which will last for at least half a century, we will see an older adult population swelling to well over one billion people worldwide and affecting the basic norms, values, and attitudes of our entire society.

In Maryland 11.1 percent of the population is over 60 years old, and that will grow to at least 17 percent by the year 2000. Indeed, some counties in Maryland already have an older adult cohort representing 20 to 30 percent of the total population.

It is reasonable to assume that within this coming era the majority of health care services and specifically, a physician's practice, will be oriented to the older adult. Two years ago the State of Maryland recognized the need to prepare for this and instituted the Geriatrics and Geronotlogy Education and Research Program (GGEAR) at the University of Maryland at Baltimore. The focus of this program is on the identification, coordination, research, and education in health maintenance and promotion among the elderly.

This issue of the *Maryland Medical Journal* reflects the interest of the University of Maryland at Baltimore in addressing the educational concerns of health care professionals as well as those of the larger population of older adults. This issue is a joint effort of the Center for Health Education, Inc., Med Chi, and our Geriatrics and Gerontology Program to reach practitioners throughout the state with current and timely information.

The health care of older adults is by nature interdisciplinary. While we physicians can help the older patient with heart disease or stroke, we also must be cognizant of the nutrition, dental health, legal concerns, and physical environment of the patient and his or her family. The broad scope and interdiscipliniary orientation or the authors of this *MMJ* issue reflect this.

As we enter the period of a grayer America we have the opportunity to build a broad and humane approach to the treatment of the increasing number of older adults. The following articles can serve as a cornerstone in this task. We applaud Med Chi and the Center for Health Education, Inc. for their leadership in the entire specturm of health care and especially for the geriatric efforts represented by this issue.

Demographic and Epidemiologic Considerations for Developing Preventive Strategies in the Elderly

JAY MAGAZINER PhD

More than 29 million Americans are aged 65 and older, over 12 percent of the US population. This number is expected to increase to 35 million by the turn of the century and to 67 million by the year 2050. Growth is expected to be greatest among the oldest and most disabled members of this group, those aged 85 and older. Persons 65 and older are the largest consumers of medical care; their care needs will be even greater as we enter and move through the twenty first century. Most persons needing long-term care will reside in the community, not in nursing homes. In light of these projections, we must be concerned with community based prevention at all levels.

Older adults, the largest consumers of medical care, are certain to be even larger users in the years ahead. As a result, one of the most important challenges facing the medical community today is how best to serve this rapidly growing segment of the population. To meet this challenge it will be necessary not only to train and retrain health professionals from a wide variety of disciplines but also to determine, well in advance, the health care needs of those who will become old at the turn of the century and beyond. Preventive strategies to reduce illness onset and resulting disability and to assure that the most appropriate care is delivered in the most efficient manner will be required. Planning is based on information about the composition and growth of future cohorts of older adults as well as knowledge of their health and health care needs in the years ahead.

Assumptions

Demographic projections require analysis of the past and present as well as assumptions about the future. Accordingly, we will assume that no major life extension efforts will be realized in the next 50 years, that the prevalence of chronic illness and resulting disability in those who become old over the next half century will not change dramatically, and that disease onset will not shift substantially to older ages. While the last two assumptions are the topic of considerable debate,[1,2] the likelihood that these assumptions will be violated by the middle of the next century is small. While we may witness shifts among which diseases are most prevalent as a result of today's preventive efforts, our projections are based on the assumption that total disease and disability will not decline in the years ahead.

When Does Aging Begin?

It is generally agreed that the aging process begins at birth, continues until one dies, varying in rate by individual and physiological system.[3] The biological passing of time since birth (chronological age) is not a particularly accurate indicator of aging or when old age begins; it is objective and, consequently, an index that is heavily relied on. A more appropriate indicator might include aspects of functioning, though we are not yet able to agree on appropriate functional indicators of aging or the level of dysfunction that determines when old age begins. Most gerontologists acknowledge this difficulty and proceed by using age 65, give or take a few years, as the arbitrary beginning of "old age." By doing this we are actually relying on another concept of aging, one driven more by social, psychological, and public policy concerns than by biological processes. Events such as widowhood, government policies surrounding retirement, and receipt of social security and Medicare probably do more to influence our view of when old age begins than do physiological changes or health status. Clearly, social and historical circumstances shape our perception of when old age begins. [4] Acknowledging this, for statistical reasons we must rely on age 65 as the beginning of old age. However, it is important to point out that those aged 65 years and over are not a homogeneous group.

Historical changes in life expectancy have had a large influence on bringing this lack of homogeneity into focus. A person born in 1900 could expect to live 47.3 years; one born in 1985 could expect to live 74.7 years. Men reaching age 65 today can expect to live until age 79, women until age 83. With these dramatic changes, two groups of aged were identified in the early 1970s: a *young-old* (65 to 74 years) group who were recently retired, in good health, of reasonable means, and with a great deal of leisure time; and an *old-old* (75 + years) group who fit our stereotypic image of the older person whose health was declining and whose resources diminishing.[5] More recently, yet another group of elders have been identified. Referred to as the *oldest-old*, this group of individuals 85 years and older are the subgroup of aged in poorest health and greatest need of health and long-term care. [6] Hence, the stereotypic old person is now even older, and the focus of much medical and public policy attention has shifted to this growing segment of the population. The heterogeneity among those 65 years and older becomes even more clear when

The author is Assistant Professor and Director, Division of Gerontology in the Department of Epidemiology and Preventive Medicine at the University of Maryland School of Medicine, Baltimore. Reprints: Dr. Magaziner, 655 W. Baltimore St., Baltimore, MD 21201.

we consider three subgroups among them: 65 to 74, 75 to 84, 85 and older.

Demographic Trends

The 29.1 million Americans in 1986 represented 12 percent of the US population; those 65 to 74 represented 7 percent, those 75 to 84 represented 4 percent, and those 85 and older represented 1 percent. The numbers and proportions have not always been this way, nor will they remain this way as we move through the next century. In 1900, there were only slightly more than 3 million Americans 65 years and older, representing only 4 percent of the US population at that time. By the year 2050, 67.4 million, or 21.8 percent of the population will be in this group. The growth in the number and proportion of persons aged 85 and older is even more pronounced. In 1900, there were only 123,000 or 0.2 percent aged 85 and older. By the year 2050, this group will number 16 million and represent 5 percent of the US population. This 473 percent increase in the oldest-old (85+) from 1986 to 2050 contrasts with increases of 74 percent in those 65 to 74 and 135 percent in those 75 to 84.[7] This demographic shift, (the result of an increased life expectancy and decreased birth rate) will have a significant impact on the population's health and on the way health care is delivered in the years ahead.

Health and Functioning

While varying among individuals, aging is accompanied by declines in acute conditions, increases in chronic conditions, and increases in resulting disability from both acute and chronic conditions. Tables 1 and 2 show these trends in summary form using data from the recently completed National Health Interview Survey.[8] Table 1 shows declines in acute conditions from age 5 on. Also noted are marked increases in disability resulting from these conditions in the form of restricted activity and bed disability days from ages 45 to 64 to 65+. Table 2 shows age-related changes in prevalence and resulting disability for the 10 leading chronic conditions among persons aged 65 and older. Here, age-related increases in the prevalence of all chronic conditions (except sinusitis) are noted, as are increases in resulting disability from 45 to 64 to 65+. While not among the 10 leading chronic conditions, significant cognitive deficits are experienced by an estimated 4.9 percent of those 65 and older residing in the community.[9] This increases markedly with advancing age, going from 2.9 percent in the 65 to 74 year age group to 15.8 percent in the 85 and older group. Furthermore, the rate of major depression and affective disorders is estimated to be 3.2 percent in those 65 and older,[9] while approximately 15 percent of

SOURCE: US Dept. of Health and Human Services. Current Estimates from the National Health Interview Survey, United States, 1985. Series 10, No. 160, September 1986.

community dwelling persons aged 65 and older experience significant symptoms of depression.[10] The three leading causes of death for all those over 65 are heart disease, cancer, and cerebrovascular diseases.[7] Each year in the United States, three out of four persons 65 and older die of one of these diseases. With increasing age, the death rate from each disease also increases.

One way to evaluate health trends is to consider historical and projected patterns of mortality and life expectancy. General patterns of declining death rates are observed for all those 65 and older between 1950 and 1985.[10] During this period, marked declines are noted in heart disease and stroke. These are offset somewhat by increases in cancer deaths.[11] Heart disease accounted for 42.8 percent of all deaths in 1984 while cancer accounted for only 20 percent. Thus, even if cancer were eliminated, the average life span would be increased by only two years because of the prevalence of heart disease. If, however, heart disease were eliminated, an average of five years would be added to life expectancy at age 65, which would lead to dramatic increases in the number of older persons in the population .[7]

Table 3 shows historical trends in life expectancy for men and women at birth and age 65. Here, it can be seen that the life expectancy at birth, which has increased for men and women from 1900 to the present, will continue to increase over the next half century though at a somewhat slower rate. Increases in number of surviving years for those who reach age 65 are also expected through the middle of the next century. Although a subject of considerable discussion, [12] past trends suggest a projection in which women will continue to outlive men.

Table 3. Life Expectancy at Birth and Age 65 by Gender, United States, 1900 - 2050.

Year	At Birth		At Age 65	
	Male	Female	Male	Female
1900	46.3	48.3	11.5	12.2
1950	65.6	71.1	12.8	15.0
1960	66.6	73.1	12.8	15.8
1970	67.7	74.8	13.1	17.0

The Long-Term Care Population: How Many and Where Do They Live?

Long-term care is a widely used expression about which there is little agreement. Traditionally, long-term care referred to institutional care and the long-term care population to those residing in these institutions. This is a rather restrictive view of long-term care since the factors influencing the use of institutions (including health and functioning) are much greater and also include social and economic factors.[13] For our purposes, the long-term care population is defined broadly to include all those so functionally disabled that they require assistance in personal care (such as dressing, bathing, eating) and/or instrumental care for community living (such as telephoning, housekeeping, shopping) for a long or indefinite period of time. It is difficult to estimate the number of aged persons needing long-term care. Using a criterion of requiring assistance in two or more physical activities of daily living, it is estimated that 9.3 percent of those 65 to 74, 16.5 percent of those 75 to 84, and 36.1 percent of those 85 and older are in need of long-term care and thus, comprise the long-term care population. The distributions of persons 65 and older by the number of physical and instrumental tasks on which assistance is needed and age are shown in Table 4. As expected, the proportion with no difficulties in physical activities of daily living (PADL) and instrumental activities of daily living (IADL) tasks decreases with advancing age, while the proportion requiring assistance in four or more tasks increases with advancing age. Using the estimates based on requiring assistance in two or more physical activities, one million persons 85 and older required long-term care in 1986. Given increases anticipated in this oldest-old segment of the population in the years ahead, an estimated 1.8 million persons will require assistance at the turn of the century, and 5.8 million will require such care by 2050. Using this definition, 12.1 million Americans 65 and older will require long-term care in 2050.

In considering the care needs of these individuals, it is important to recognize that most do not reside in institutions at present and are not likely to in the future. In fact, it is estimated that between 70 and 80 percent of those needing long-term care reside in the community.[14] Those requiring long-term care in the community are expected to increase considerably over the next 50 years.

1. Includes bathing, dressing, eating, getting in and out of bed or chairs, walking, going outside, using the toilet.

2. Includes preparing meals, shopping for personal items, managing money, using the telephone, doing light housework, doing heavy housework.

Health Care Utilization

With greater populations of older persons having chronic conditions and requiring long-term care, the elderly, as a group, are and will continue to be the largest consumers of health care. On average, those 65 and older visit a physician eight times a year compared to five visits per year by the general population.[8] They are hospitalized more than twice as often as younger persons, and they represent 88 percent of all nursing home residents.[7,15]

Hospital use can be evaluated in terms of hospital discharges and the average lengths of stay per admission. The general pattern over the past 20 years has been an increase in discharge rates and a decline in average length of stay. In 1985, there were an estimated 10.5 million hospital discharges in the United States for those 65 years and older, more than twice the number (4.6 million) in 1965.[7] In addition, the discharge rate per 1,000 persons 65 years and older increased from 249.3 to 368.3 during that 20 year period. The early 1980s saw a downward shift in this trend: between 1983 and 1985, there was a 10.7 percent decline in discharge rates, most likely the result of DRG= based reimbursement and associated increases in the use of out-patient surgical procedures. The average length of hospital stay declined steadily from 1968 to 1985, from a high of 14.2 days per stay in 1968 to 8.7 days per stay in 1985. Discharge rates for those 85 and older are twice that of those 65 to 74 (563.6/1,000 vs. 294.9/1,000) and the average length of stay is 17 percent longer (9.6 days vs. 8.2 days).

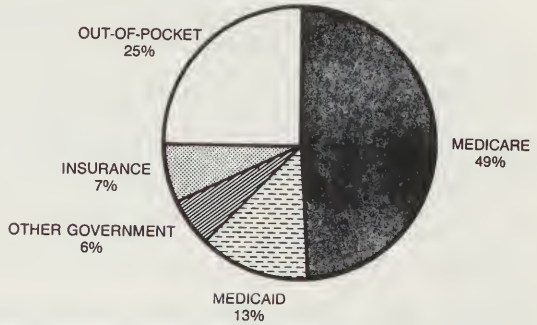
In 1986, the National Center for Health Statistics estimated there were 249.8 million office visits by non-institutionalized individuals 65 years and older in the United States, accounting for 19.6 percent of all office visits in this country. Use of physician services also increases by age among those 65 and older. In 1986, persons of all ages averaged 5.4 visits per year, while those 65 and older averaged 9.1 visits per year. As with hospital use, the older members of this group used more physician services (8.1 visits per year for those 65 to 74 vs. 10.6 visits for those 75 and older).

The number of persons 65 and older in nursing homes in 1985 totaled 1.3 million, more than twice the number in 1963 (0.45 million) but only slightly more than the number in 1977 (1.1 million).[15,16] Given the changing demography of the population and the rise in the number of oldest-old, we can expect dramatic increases in the numbers needing nursing homes in the next 50 years. While the numbers of individuals using nursing homes has increased and the need will continue to increase markedly over the next 50 years, at present only 4.5 percent of those 65 and older reside in long-term care institutions.[15] This is a critical figure as it indicates that the vast majority of older Americans reside in the community. The proportion institutionalized has remained essentially unchanged since 1977 when 4.8 percent of those 65 and older were institutionalized and since 1974 when 4.5 percent of those 65 and older were institutionalized.[16] Given that the proportion of elderly 85 and older is increasing and that this group is the largest user of nursing home care, this 4.5 percent figure is likely to change over the next 50 years. Whether it grows or shrinks relative to demographic expectation will depend on social and public policy issues, not biological capacity.

Use of other health care by those aged 65 and older varies by service; with few exceptions, the elderly use more of each service than do younger groups. For example, the elderly have made less use of dental services but significantly more use of prescription medications and assistive devices such as canes, walkers, eyeglasses, and hearing aids.

Health Care Expenditures

Those 65 years and older currently account for one third of this country's total personal health expenditures (total health care costs from all sources). Of the total ($4,200 in 1984), one third represented payments to providers or insurers. The total health care expenditure for all elderly in 1984 was $120 billion. On a per capita basis, most personal health care expenditures go to hospital costs, followed by physician and nursing home costs.[7] Private insurance pays hospital and physician costs while out-of-pocket funds pay for nursing home, physician, and other types of care. Medicare funds are used primarily to cover hospital expenses, while Medicaid funds are used primarily to cover nursing home costs.



The Figure shows the distribution of personal health care expenditures by source of payment. In 1984, Medicare covered 40 percent of personal health care expenditures for those 65 and older. These funds were distributed to hospitals (69 percent), physicians (29 percent), nursing homes (1 percent) and to other providers (5 percent). Medicaid funds, which accounted for 13 percent of personal health care expenditures, went primarily to nursing homes (68 percent). Hospitals received 15 percent of Medicaid funds, physicians received 2 percent, and other health care providers received 15 percent of these public funds. Twenty-five percent of health care expenses were paid from out-of-pocket funds. These went primarily to cover nursing home costs (42 percent), followed by physicians (21 percent) and hospitals (6 percent). Thirty-one percent of out-of-pocket funds went to all other forms of care.

These figures indicate that public funds going to other forms of care, such as medications, home nursing, and an array of other community services are quite limited; this category of care is paid for primarily by out-of-pocket dollars. Assuming that major shifts in public funding do not occur, the growing amount of community based long-term care we anticipate needing in the future will have to be financed through private funds. Experiments with various forms of long-term care insurance are under way, but it is too early to know how effective they will be in paying for long-term care services for the vast majority of older persons needing this care. While future trends in financing cannot be predicted, without major changes in government financing for health and long-term care, it is not likely that the increased burden will be financed through public funds.

Implications for Prevention

Demographic and epidemiologic descriptions provide evidence about the needs for preventive efforts.

PERSONAL HEALTH CARE EXPENDITURES FOR THE ELDERLY BY SOURCE OF PAYMENT: 1984

SOURCE: Waldo, Daniel R. and Helen C. Lazenby. "Demographic Characteristics and Health Care Use and Expenditures by the Aged in the United States: 1977-1984." Health Care Financing Review Vo. 6, No. 1 (Fall 1984).

FROM: Aging America: Trends and Projections, 1987-88 edition.

Projections clearly indicate the need to provide medical care for increasing numbers of older persons in the years ahead. With increases in the numbers of oldest-old persons, we will also find that increasingly larger numbers will require long-term care. If our projections are correct, most of those needing of long-term care will reside in the community, not the nursing home. Hence, it is here that we must focus greater planning efforts. Since public funds are most readily available for institutional forms of long-term care, alternative funding strategies need to be developed for providing this care for those in the community. While not a biomedical intervention, this represents a major challenge to the provision of health care to the aged in the future.

We have challenges at all levels of prevention. We need to expend considerable effort on tertiary prevention in the areas of disability reduction and rehabilitation because significant numbers of older persons experience chronic conditions and resulting disability. Given that most older persons in need of this care will live in the community, we need to give considerable attention to how such care can be provided in noninstitutional environments. Secondary preventive efforts in the form of screening programs need to be developed further and used more widely. Again, since most older persons reside in the community these preventive services should be delivered there as well. To prevent disease and disability in late life, we must not limit preventive efforts to those who are presently 65 and older. Primary prevention should target all age groups. Many preventive efforts directed at those of school age or in their young adult years will have their greatest payoffs in terms of a healthier older population by the middle of the next century. As medical professionals, it is our obligation to assure that effective health care becomes more readily available for all. Our challenge in

preparing for the future is to begin implementing preventive efforts now.

Health Promotion and Disease Prevention in the Care of Older Adults: Preventive Practice in Primary Care

LINDA P. FRIED MD, MPH

Prevention is an important and appropriate component of the primary care of older adults. Office-based approaches to prevention include routinely scheduled examinations for health maintenance and case finding for early disease and disability during visits scheduled for other purposes. The primary care clinician is the optimal person for effective preventive intervention in patients 65 years and older. The spectrum of preventive activities ranges from screening by history taking, physical examination, and laboratory tests to intervention by counseling and therapeutic intervention. Unfortunately, substantial barriers exist to widespread incorporation of preventive practices into primary care, including the need for information and the low level of third-party reimbursement in this area.

The large burden of illness for older people is due to chronic disease and to its acute complications, functional sequellae, and associated health care needs. The demographics of an increasingly larger older population demand an increasing practice of preventive measures to diminish this burden for both individuals and for society. Such prevention must be aimed not only at preventing the onset of new disease but also at minimizing the impact of disease already present by preventing unnecessary morbidity and disability, enhancing quality of life as much as possible. Such a broad role for prevention parallels the wide spectrum of health concerns in this older age group. Preventive health care in persons 65 years and older incorporates all three types of prevention: primary (prevention of the onset of disease), secondary (screening to detect early disease, and intervention to arrest the progress), and tertiary prevention (measures to minimize the effects of disease on the level of independence and activity). [1]

The minimal components of recommended preventive health care practice for older adults are a combination of the recommendations for the Periodic Health Examination for persons 65 years and older and the screening recommended clinically as optimal geriatric care.

This combined package, supported by clinical experience, will be tested among patients in eastern Baltimore over the next two years as part of the national Demonstration and Evaluation of the impact of reimbursing for preventive health services for medicare beneficiaries, funded by the Health Care Financing Administration. This randomized, controlled trial will test the feasibility of offering Medicare reimbursement for physician provision of preventive health care services to older Americans. It will also test whether such services lead to appropriate changes in health habits and earlier diagnosis of conditions benefiting from early treatment. The ultimate question of the cost effectiveness of such services and their impact on long term health outcomes, functioning, and health care costs for older persons remains to be assessed in future trials.

Dr. Fried is Assistant Professor in the Department of Medicine and Epidemiology, and is Director of the Geriatric Assessment Center at the The Johns Hopkins University School of Medicine, Baltimore. Dr. Fried is also a Henry V. Kaiser Family Foundation Faculty Scholar in General Internal Medicine.

Approaches to Prevention

The office setting offers two major types of opportunities for the practice of preventive care:

1. Periodic health exam, which involves screening on a pre-defined periodic basis for risk factors for the development of disease and identifying asymptomatic disease for which early treatment significantly improves outcome and
2. Case finding, defined as screening for problems responsive to preventive health care, done at an office visit scheduled for other illness, as well as the follow-up of such findings.

For example, cost-effective screening for persons 65 and older includes early identification and treatment of diastolic hypertension for prevention of stroke.[2] An example of effective primary prevention is influenza immunization in this age group. Case-finding strategies include early identification of geriatric conditions such as periodontal disease, urinary incontinence, falls, and hearing and visual impairment; these conditions carry a high morbidity, are generally underdiagnosed, but often are amenable to intervention.

Combined with the practitioner's longitudinal knowledge of the individual patient, these approaches provide unique opportunities in the primary care setting for developing preventive interventions tailored to the individual. In addition, given that older persons are known to turn to their primary care provider preferentially for medical and mental health care, [3] counseling (whether regarding mental health, major life changes, or regarding health habits and risks) is likely to be best received from that same provider.

The approach to prevention in the primary care of the older person varies, as in the younger, by the patient's characteristics. Preventive health care recommendations for the "young-old" (65 to 74 years) and the "old-old" vary to some extent, particularly in an increased focus on tertiary prevention of loss of functional autonomy with increasing age. Setting also influences risk assessment: environmental hazards place a vulnerable individual at higher risk of falls, and institutionalization increases the risk of both tuberculosis and influenza.[4] In addition, base-line health status changes risk: persons on multiple medications are at increased risk of drug interactions and some side effects compared with those on no medications.[5] Persons with multiple chronic diseases appear to be at increased risk of malnutrition compared to those without clinical disease.[6] Persons with specific diseases such as dementia or stroke and those dependent in their daily functioning are at increased risk of institutionalization.[7] These examples indicate risk characteristics that need evaluation in a preventive health care screening for older persons and stress that the spectrum of risk factors is broader for them than for younger groups.

Components of Prevention: Primary Care Setting

Periodic Health Examination Current recommendations for periodic health maintenance in the office setting are a result of reports from four different groups over the last 15 years[8-13] that have been summarized and discussed by the American College of Physicians; the latter report reviewed the specific screening intervals recommended.[14] In general, the areas currently recommended for routine primary prevention are:

Patient education for accident prevention; seat belt use; techniques for self-examination of the skin, oral cavity, breast, and testes; and to report post-menopausal bleeding.

Health habit promotion including counseling for smoking cessation, nutrition, weight loss, regular exercise, daily oral hygiene, proper medication use, and sleep.

Primary disease prevention including immunization for influenza (annually), pneumococcus (one time only), and tetanus booster (every ten years), cholesterol screening for risk of coronary heart disease, and techniques for prevention of periodontal disease and dental caries.

Secondary and tertiary prevention encompassing screening for early disease, such as for hearing impairment; hypertension; hypothyroidism; cancers of the breast, cervix, colon and rectum, oropharynx, and skin. Screening also is recommended in persons 65 and older for malnutrition and for functional impairment, and in persons at high risk, for tuberculosis and for cancer of the bladder.

Case Finding For geriatric conditions amenable to prevention, it is important to screen (during visits for other reasons) for evidence of cognitive decline or disorientation; functional decline or dependency; depression; drug side effects, overdosage, or interactions; environmental risks; falls or fall risk; unnecessary immobilization; incontinence; podiatric problems; and visual impairment. Early identification of these problems will aid in the prevention of unnecessary morbidity and/or disability.

Barriers to Prevention in Older Persons

In the past, a major obstacle to practicing preventive health care with older persons was the impression that it was not useful for this age group. With increasing recognition that appropriate preventive care is not only relevant but also necessary,[7] the major obstacles are in other areas. These barriers are, first, scientific. Not enough work has been done to define and evaluate the most cost-effective preventive strategies appropriate to the 65 years and older age group. Second, both patients and practitioners need to be educated as to the currently recommended strategies for prevention and their potential for maintaining or improving health status, functioning, and the quality of life. Increased emphasis on secondary and tertiary prevention, outlined above, is appropriate to these health objectives. Past focus only on primary prevention limits the potential benefit for preventive care in older age groups.

> *Patients, as well as practitioners, must understand the distinction between normal aging and pathology, and that the latter is not an inevitable consequence of the former.*

Finally, a significant obstacle is the lack of third-party reimbursement for most preventive health care. Medicare, in effect, does not include preventive care as a benefit and thus is a major inhibitor of the ability of practitioners to provide such care. We hope the current demonstration and evaluation program in progress in Baltimore will provide data supportive of changing this reimbursement policy.

In summary, there is an important and expanding role for the primary care practitioner in the provision of effective preventive health care for older adults. While many potential areas for prevention remain to be tested, there is a clear mandate for incorporating currently recommended prevention strategies into clinical care for patients 65 years old and older.

Nutrition

ELIZABETH L. ROGERS MD

Although we are on a steep learning curve as far as the exact relationship between nutrition and disease prevention is concerned, evidence is accumulating on the role of body mass index and mortality, protein deficiency and decreased ability to fight infection, effect of fiber intake on cholesterol and glucose metabolism, hyperlipidemia and atherosclerosis, and inadequate calcium intake in osteoporosis.

Screening for nutritional disorders includes identifying those with risk factors of being female, black, poor, or institutionalized. Evidence of weight change, dietary idiosyncracies, nutrient deficiency, and laboratory tests can be helpful. Treatment should be tailored to the individual and be specific for suspected deficiencies. Attention to calories, protein, and calcium are paramount.

The elderly differ from young adults in body composition, eating habits, biochemical makeup, socioeconomic approach to life, and ability to tolerate change or stress. Moderation and attention to the practicality of suggestions is important in giving nutritional advice to the elderly.

Social isolation, transportation difficulties, loss of dentition, arthritis, mobility problems, visual impairments, altered taste, and neurologic disorders result in dietary inadequacy. The high frequency of medical and psychologic disease processes also decrease appetite, alters gastrointestinal motility and absorption, and may change metabolism.

Role of Nutrition in Disease Prevention

Concern about weight is a major issue with the elderly. Media advertisements and discussions promote the thin and trim. While graded exercise can be associated with improvement in oxygen delivery and with loss of fat stores, there are no data that weight loss in nonobese, nondiabetic, and nonhyperlipidemic elderly extends human life. This is in contradistinction to rodent studies that have shown delayed maturation and delayed senescence with calorie protein restriction that does not result in malnutrition. Rather than reinforcing the need for weight reduction in the nonobese elderly, modern data suggests very thin people have a reduced life span. Improved longevity is found in those elderly who are 10 to 25 percent greater in weight than previously thought "ideal body weight" standards.[1]

As people age, they tend to consume fewer calories. A major effect of reduced calories is that intakes of many nutrients are liable to be consumed in smaller amounts. Yet, the elderly may require **more** protein per kilogram of body weight than do younger people to avoid a negative nitrogen balance.[2] It is not surprising that decrease in serum albumin, lean body mass, and total body protein is seen with aging. Protein deficiency is associated with decreased immune function ability to fight infections and decreased ability to mount appropriate neurohumoral responses to stress. Whereas infection with tuberculosis or histoplasmosis is more common in the malnourished elderly, survivors in longitudinal studies have been shown to be those ingesting fairly high quantities of protein throughout their life.

Increased fiber intake has been associated with decrease of constipation. In hyperlipidemics, increased fiber may lead to decreased cholesterol, while in diabetics one sees better glucose tolerance. Fiber has been associated with binding of potentially carcinogenic toxins.

Coronary heart disease death rates and peripheral vascular occlusive disease are higher in hyperlipidemic persons of all ages. Efforts should be continued to reduce elevated low density lipoproteins and to raise the protective high density lipoproteins by reducing saturated fats and substituting for them polyunsaturated fats.

Of recurring concern in the elderly are problems with water and electrolytes. Impaired thirst response, decreased ability of the kidney function and a decreased response to antidiuretic hormone all predispose the elderly to dehydration. If access to water is limited due to impaired mobility, confusion, drugs, or illness, dehydration quickly occurs. Hyponatremia and/or hypokalemia, associated with diuretics or prescribed diets, are also frequent problems.

Osteoporosis is a major cause of fractures, immobility, and death in the elderly. Risk of osteoporosis can be decreased by adequate calcium intake in middle life and continued adequate calcium intake with exercise by the elderly.[3] Other risk factors for osteoporosis include older age, female sex, lower than ideal weight, immobility, lack of exercise, lack of sunlight and vitamin D exposure, cigarette smoking, coffee drinking, a high phosphate/calcium ratio, and use of drugs such as corticosteroids, isoniazid, and aluminum-containing antacids.

Dr. Rogers is Chief of Staff, Baltimore VAMC, an Associate Professor of Medicine and Associate Dean of Graduate Medical Education and Veterans Affairs at the University of Maryland School of Medicine.

Iron deficiency, on the other hand, is rarely due to poor nutrient intake in the elderly. Iron deficiency anemia should not be considered to be of dietary origin until gastrointestinal blood loss has been ruled out.[4]

Screening for Nutritional Disorders

British surveys find malnutrition in 5 percent of those aged 70 to 80 and 12 percent in those over 80. As many as 50 percent of the elderly consume less than 66 percent of the Recommended Dietary Allowances(RDA). The most common problem found is protein-calorie malnutrition with deficiencies also found in calories, calcium, vitamin A, and thiamine.[5] Dietary idiosyncracies may lead to avoidance of one or more of the basic four food groups: fruits/vegetables, protein, dairy, or grains/complex carbohydrates. Brief questioning about the basic four food groups therefore may be useful. Based on food records from healthy diet conscious, relatively affluent senior citizens in Albuquerque, NM, Garry found inadequate protein intake in 11 percent of men and 14 percent of women. Despite vitamin and mineral supplements in 60 percent of this population, adequate intake of calcium and Vitamin D did not occur in women.[6]

A recent history of institutionalization, change of social circumstance, weight loss, financial problems, or altered mobility should raise the question of dietary adequacy. Social isolation due to loss of spouse and friends, decreased access to food because of visual or neurologic problems, altered ability to taste and smell food, and altered ability to chew food because of inadequate dentition also place the elderly at risk for inadequate intake.[7]

Simple weight measurements are invaluable as a gauge of weight change over time. Anthropometrics confirm clinical suspicions, despite the problems of height changes with age, altered skin-fold thickness with poor skin turgor, alteration in distribution of fat, and alterations in skin thickness.

Clinical signs of nutrient deficiency in the elderly are uncommon, but in 10 percent of the elderly population one can find filiform papillary atrophy and tongue fissures (niacin deficiency), absent knee and ankle jerks (thiamin deficiency), bowed legs (vitamin D), follicular hyperkeratosis (Vitamin A deficiency), and bleeding or swollen gums (ascorbic acid deficiency).[8]

Hypoalbuminemia, anemia, and lymphocytopenia yield supportive evidence for the presence of significant protein calorie malnutrition, although these can be findings associated with aging alone.[9] Biochemical nutrient levels tend to decrease before clinical signs are present. However, the correlation between intake and biochemical levels and between levels and clinical significance leave many questions. Yet low serum levels of iron, folic acid, or cobalamin should not be ignored.[4,10,11]

Maintaining Nutritional Adequacy

One of the main goals in treating the elderly is to maintain the patient's interest in eating and to tailor suggestions to fit the likes, habits, and economic views of the patient. Patients should be encouraged to consume recommended servings of the basic four food groups to yield 1200 Kcal daily, with as wide a variety as possible. Treatment should be specific for the suspected deficiencies and aimed at the maintenance of optimal physiologic function and the prevention of age-dependent diseases and disorders.[12]

Vitamins and minerals should be supplied as necessary to supplement an inadequate intake. Megavitamins have not been shown to be helpful and may enhance problems such as osteoporosis.[13] Osteoporosis studies have demonstrated reduced loss of bone mass with exercise and adequate calcium intake (1500 to 2000 mg/day), especially if phosphate intake (found in processed foods) is kept low. Several studies have shown increased bone density over six months with augmented calcium intake.[14]

To correct recent weight loss, calories should be 150 percent of basal energy expenditure or 2000-3500 Kcal daily. This can be in the form of frequent meals with supplements of foods that the patient wishes after meals. Because liquid supplements added to the meals may end up being consumed instead of solid food, packaged supplements may add cost without increasing total caloric intake. The help of clinical dietitians can be invaluable in helping the elderly patient find a palatable, affordable adequate diet.

Enteral alimentation through a small polyethylene feeding tube should be considered for those with impaired swallowing, those with altered gastrointestinal motility, those undergoing surgery or acute illness, or those who are acutely anorectic secondary to weight loss.[15]

Parenteral nutrition most frequently is reserved for those elderly who require rapid correction of calories, proteins, fluid, and electrolytes associated with surgical procedures or those with severe self-limited impairment of gastrointestinal function.[16]

Oral Health

LINDA C. NIESSEN DMD, MPH and GEORGE C. WILLIAMS DDS, MBA

The risk for the most serious oral disease, oral cancer, increases with age as does the prevalence of other oral soft tissue diseases. Tooth loss is not part of normal aging. As more elderly retain their natural dentition, they are at continued risk for tooth-related diseases such as caries and periodontal disease. Preventive dental programs, including an oral exam as part of the physical examination, will be indicated for adults.

At the recent Surgeon General's Workshop on Health Promotion and Aging, oral health was one of the nine working groups offering recommendations for health promotion and disease prevention activities.[1] We review changes in oral disease patterns among older adults and their implications for oral health promotion and disease prevention in this population.

Many generalizations exist about aging and the oral cavity, but longitudinal studies are contributing to the knowledge on age-related oral changes.[2] Expected tooth loss and decreased salivary flow are two examples of the myths surrounding oral health and age. It is now recognized that tooth loss is not a normal age change but the consequence of oral diseases such as caries or periodontal disease.[3] Similarly, recent work has shown that salivary flow in nonmedicated adults does not decrease with age.[4,5] What was thought to be age-associated was in effect a pharmacologic-induced decrease as a result of medications.

Table 1 lists types of medications that can cause xerostomia, characterized by symtoms of difficulty chewing, swallowing or speaking. Saliva has anti-bacterial properties, and persons without adequate salivary flow are at increased risk for developing caries and/or periodontal disease.

For patients with decreased salivary flow or with symptoms of dry mouth that do not appear to be medication related, appropriate referral for evaluation of primary salivary gland pathology is indicated. Saliva substitutes that reproduce the minerals found in saliva can alleviate the discomfort of oral dryness. They can be used ad libitum and are available at local pharmacies or dentists' offices.

Oral cancer is primarily a disease of older adults, and incidence rates increase with age.[6] The estimated incidence of oral cancer for men is 4 percent and 2 percent for women.[7] Mortality in the United States is high: less

Dr. Niessen is Director of the Geriatric Dental Program, Veterans Administration Medical Center, Perry Point, and Clinical Associate Professor Baltimore College of Dental Surgery, University of Maryland. Dr. Williams, is Assistant Professor, Baltimore College of Dental Surgery, University of Maryland, Baltimore.

than half the patients with oral cancer are cured. Most oral cancers are squamous cell carcinomas, and the tongue is the most common site. Use of tobacco and alcohol are risk factors associated with oral cancer.

Given the association of oral cancer with age, oral cancer may be a more frequent problem in the future. Elimination of risk factors and early diagnosis appear to be the most effective ways to improve morbidity and mortality associated with oral cancer. Physicians treating older adults will need to thoroughly evaluate the oral cavity during the physical examination.

The most striking change in the oral health status of older adults is the decline in edentulism in the past 20 years.[8] Table 2 shows the trends in edentulism: there are now more elders with than without teeth. A recent survey by the National Institute of Dental Research (NIDR) of employed adults and senior citizens found that only 4 percent of the employed population and 41 percent of seniors were edentulous.[9] The decline in edentulism is likely to continue as these employed adults age.

The downside of this good news in oral health status is that elders' natural dentition will continue to be at risk for dental caries and periodontal diseases. Dental caries can affect either the coronal portion of the tooth or, if the gingiva has receded to expose the tooth root, the root surface of the tooth. While coronal caries is not considered a problem in adults, recent epidemiologic surveys have shown that decay rates were higher in some adult age groups than in children.[6,10] Anecdotally, root caries is thought to be a greater problem in older adults. Several small studies have confirmed that certain elderly populations, such as nursing home residents, are at greater risk for root caries than community dwelling elders.[11,12]

Fluorides will play a continued role for adults in caries prevention efforts. Recent studies of caries in adults have shown that adults with lifelong residence in communities with fluoridated water have approximately 50 percent less caries than those living in nonfluoridated communities.[13] Self-applied fluorides as rinses or gels are indicated for those elders with high coronal or root caries rates.

Periodontal diseases includes gingivitis and periodontitis. Both are bacterially mediated. Gingivitis is an inflammation of the gingival tissue; periodontitis is an inflammation of the periodontium or supporting structures of the teeth. Gingivitis most often occurs in the presence of poor plaque control. In addition, medications such as phenytoin or nifedipine induce a gingival hyperplasia in the presence of plaque. Since use of these medications increases as patients age, persons taking these medications will need to be advised of potential adverse oral effects.

It is not clear that the severity of periodontal disease increases in older adults. Surveys in Iowa and North Carolina have shown that the prevalence of severe periodontal disease may range between 5 to 10 percent in older adults.[14,15] One hypothesis is that individuals lose periodontally diseased teeth before they reach age 65.

With caries and periodontal disease continuing to occur throughout one's lifetime, dental preventive efforts will be important for older adults. Brushing and flossing are valuable in the prevention of caries and periodontal diseases. Individuals with physical or mental disabilities that cause loss of neuromuscular or cognitive function (such as stroke, arthritis, or dementia) prohibiting daily oral hygiene may need assistance in toothbrushing. Severely impaired adults will be dependent on a caregiver to provide daily oral hygiene.

Little is known about the effect of the grinding of hard tissues on oral health.[6] The older one is, the more one's teeth have been exposed to factors that cause erosion or abrasion. Eighty years of chewing or brushing will wear away enamel, dentin, and cementum. However, the clinical significance of tooth erosion or abrasion is not known. Severely abraded teeth may be sensitive to cold. Occasionally the sensitivity can be decreased with the use of a desensitizing toothpaste or stannous fluoride gel. The use of a soft toothbrush can prevent some abrasion.

In patients wearing dentures, oral soft lesions and *Candida albicans* infections occur frequently. Oral soft tissue lesions can be denture related, tobacco induced (such as nicotinic stomatitis), or due to other causes (such as reactions to medications). Candidiasis can occur under dentures as denture stomatitis or at the corners of the mouth as angular cheilitis. Candidiasis under a denture often can be prevented by good denture hygiene. Removal of the denture and rinsing after eating and thorough cleaning of the denture at least once a day can prevent the accumulation of plaque in the denture. Antifungal agents including nystatin, mycelex troches, or ketaconizole are used to treat the candidiasis. If the patient wears a denture, the denture also must be cleaned with either sodium hypochlorite or nystatin.

Use of Dental Services

The elderlys' use of dental services is changing dramatically. From 1963-1964 to 1983, use of dental services by the elderly doubled.[8] In 1963-1964, approximately 20 percent of the elderly saw a dentist in a year; by 1983, this increased to 43 percent. Table 3 shows the percentage of the elderly visiting the dentist in a year by dentition status. These data show that approximately 60 percent of the elderly with teeth see a dentist in a year compared to 12 percent of the edentulous elderly, [8] suggesting it is very important for physicians treating older adults, particularly edentulous elders, to include an oral exam as part of the physical exam since the edentulous elder is unlikely to have recently visited a dentist.

For elders in a nursing home or those who are homebound, access to dental care will continue to be difficult. Dentists are beginning to affiliate with long-term care facilities as these facilities begin to recognize the oral health needs of their residents.

Table 3. Percent of Americans visiting Dentist within Last Year

Dental Visit Within Last Year Years	Edentulous (percent)	Dentate (percent)
35-44	17.8	61.9

Sleep

PHILIP L. SMITH MD

Our understanding of the effect of aging on normal sleep and specific sleep disorders in the elderly has increased significantly in the last decade.[1-3] Sleep complaints and the use of sedative hypnotics in the elderly are now more frequent than in younger patients.[5] It is important in the management of elderly patients to determine whether a formal laboratory evaluation of a patient needs to be undertaken to diagnose a specific sleep disorder prior to initiating drug therapy for nonspecific complaints of difficulty with sleep.

With aging, the normal four to five cycles of alternating continuous non-REM and REM sleep is replaced in older individuals by delayed sleep onset, decreased slow wave sleep, multiple arousals, and shortened periods of REM sleep.[6] This fragmentation of sleep may be responsible for a feeling of nocturnal insomnia that may be associated with fatigue or sleepiness during the daytime. The relationship between the normally fragmented sleep associated with aging (perceived

Dr. Smith is Associate Professor of Medicine, The John Hopkins-University, Baltimore.

as insomnia) and the level of daytime alertness (sleepiness, lethargy) is unclear since many individuals with similarly fragmented sleep do not necessarily complain of difficulties during the daytime.

Insomnia and Hypersomnolence

In general, the screening for significant sleep disorders centers around two major complaints.[1] First, elderly patients may complain of insomnia, an inability to initiate or maintain sleep. Insomnia may be transient or episodic due to short-lived symptoms precipitated by specific events or more persistent insomnia that may be due to either normal aging or a worsening of a lifelong history of anxiety. Other causes of insomnia include sleep apnea or movement disorders that cause frequent complete awakenings from sleep.[7-9] A common complaint of elderly patients is insomnia due to chronic pain, dyspnea, or other symptoms associated with a major medical illness. Depression can be associated with insomnia but usually is characterized by normal sleep onset accompanied by early morning awakenings. Medications taken for various medical illness can markedly disrupt the sleep cycle. For example, antihypertensive and seizure medications tend to be sedating during the daytime, thus causing difficulty with initiating sleep at night. One of the most commonly abused medications in the elderly are sedative-hypnotics that induce rebound insomnia when the drug is removed after tolerance has developed from prolonged usage.

The second major complaint in the elderly with sleep disorders is hypersomnolence.[1] Sleepiness may be more difficult to detect since napping is commonly ignored in older individuals in whom the tendency to sleep is assumed to be normal concomitant of aging. In fact, any evidence of change in the normal sleep-wake pattern, as manifested by either a tendency to nap during sedentary periods or difficulties in remaining alert during normal activities, suggests that nocturnal sleep is being disrupted. Two of the most common causes of daytime hypersomnolence are obstructive sleep apnea or periodic leg movements that lead to recurrent arousals and fragmentation of sleep. Other conditions associated with daytime hypersomnolence are not necessarily due to disrupted sleep. For example, narcolepsy is a frequent cause of hypersomnolence in young to middle-age individuals, but it is a rare cause of sleepiness in the elderly population.[8] Certain types of chronic underlying medical illness such as hypothyroidism, hyperglycemia, and acute carbon dioxide retention may depress central nervous system function and result in daytime hypersomnolence. In general, the degree of hypersomnolence usually correlates with the underlying severity of the medical illness. Acute and chronic affective disorders, especially depression, also lead to alterations in sleep pattern and daytime hypersomnolence. Finally, sedating medications, in particular the antihypertensives, antiseizure, and psychotropic drugs, may lead to significant daytime hypersomnolence.

Sleep Screenings and Studies

It has been suggested that screening tests prior to overnight sleep studies (polysomnogram) might identify patients with certain types of sleep disorders.[10] However, there is no evidence that screening tests are either sensitive or specific. Therefore, the confirmation of a specific sleep disorder requires a full-night study of sleep. These studies generally are carried out within a specialized sleep laboratory and include extensive monitoring with electroencephalographic, electroculoographic, and electromyographic recording to properly stage sleep. Simultaneous recordings of respiratory effort, airflow, and oxygenation are performed to quantitate the pattern of breathing as well as to document the level of arterial oxygen saturation during the night. An anterior tibial electromyogram is placed to diagnose periodic movement disorders. An electrocardiographic recording is routinely conducted to note the type and possible associated arrhythmias in the relation to sleep state and/or respiratory abnormalities.

While polysomnograms have become common within the community, it is not necessary to study all patients with insomnia or hypersomnolence. A general approach to the evaluation of patients should be a careful history and physical exam to document significant alterations in the sleep-wake pattern. Elderly patients presenting with a complaint of insomnia do not require an immediate evaluation in the sleep laboratory unless sleep apnea or periodic leg movements are suspected. Insomnia due to psychophysiologic factors or underlying psychiatric illness will benefit from initial clinical management and, possibly, judicious use of sedative hypnotics prior to the laboratory study. Particular attention should be paid to determining whether other medical factors are contributing to the insomnia, especially undiagnosed depression. If symptoms persist, a formal sleep evaluation to document the severity of insomnia may be undertaken. Patients who have obvious clinical hypersomnolence due to an underlying medical condition, psychiatric illness, or medication do not need a sleep study initially. However, patients who are suspected of having sleep apnea, periodic movements, or narcolepsy will benefit from the polysomnogram that will document specific sleep disorders.

Summary

The treatment of insomnia or hypersomnolence is directed at the underlying etiology of the disorder. A short course of sedative hypnotic medications can be used in the treatment of transient insomnia until precipitating factors have resolved. Chronic insomnia will require a more experienced individual versed in the various behavioral techniques now being used. In general, therapy for sleep apnea and periodic leg movements is less tolerated in the elderly since the side effects of various treatment options are often as bothersome as the sleep disorder.

Incontinence

JOSEPH OUSLANDER MD

Urinary incontinence, a prevalent and costly health problem that can have adverse effects on a patient's physical health and psychosocial status, often influences decisions for institutionalization.[1-3]

The financial cost of managing urinary incontinence has been estimated by the Surgeon General of the United States to be as high as $8 billion per year. With recent advances in the diagnosis and treatment of incontinence, this condition now can be cured or substantially ameliorated in the vast majority of patients. [4] Recent reviews have detailed current knowledge of the pathophysiology of urinary incontinence and have provided plans for diagnostic evaluation and treatment.[5-7]

Numerous anatomic and physiologic changes associated with aging, as well as pathologic conditions that become more prevalent with aging, can affect lower urinary tract function and continence.[8,9] In women normal aging is associated with a loss of estrogen effects on the tissues of the lower urinary tract, resulting in symptoms of atrophic vaginitis and urethritis and in weakening of the periurethral tissues. Normal aging in men is associated with enlargement of the prostate. In some cases, however, this enlargement may lead to the development of urinary retention with overflow incontinence and detrusor instability with irritative voiding symptoms.

Dr. Ouslander is Assistant Professor, Division of Geriatric Medicine, University of California at Los Angeles, School of Medicine, and Medical Director, Jewish Homes for the Aging of Greater Los Angeles.

Types of Incontinence

Acute urinary incontinence begins suddenly and usually is related to an acute medical problem. Any patient who abruptly develops urinary incontinence should be evaluated for urinary retention with overflow incontinence, which may be caused by immobility, fecal impaction, or anticholinergic agents, narcotics, alpha- and beta-adrenergic agonists, and other drug side effects.

Although the relationships of bacteriuria and pyuria to the pathogenesis of urinary incontinence is unclear,[8] any acute inflammatory condition in the lower urinary tract causing frequency, urgency, or polyuria (for example, uncontrolled diabetes, venous insufficiency, or congestive heart failure) can precipitate incontinence.

There are five basic types of **persistent incontinence**: stress, urge, overflow, functional, and a combined

pathological condition called detrusor hyperreflexia with impaired contractility.

Stress incontinence This type of incontinence generally is described as the involuntary loss of small amounts of urine with increases in intra-abdominal pressure, such as occur in laughing, coughing, or exercising. Stress incontinence is far more common in women than men and often is seen in conjunction with detrusor instability and symptoms of urge incontinence.

Urge incontinence This form of incontinence is manifested by leakage of urine, usually in larger amounts, because of an inability to delay voiding after perceiving a sensation of bladder fullness. This incontinence also often is associated with detrusor motor instability or hyperreflexia.

Overflow incontinence Patients with significant urinary retention may develop overflow incontinence due to anatomic obstruction as opposed to an inability of bladder to contract. Obstructive voiding symptoms often are present, or the patient may experience frequent losses of small amounts of urine without warning. The most common causes of overflow incontinence in men are prostatic enlargement and urethral stricture. In some women, overflow incontinence can occur when a large prolapsed cystocele obstructs the urethra and retains urine.

Functional incontinence Urinary leakage happens because of a person's inability to get to a toilet in time as the result of either impaired physical or mental function. This type of incontinence is especially prevalent among institutionalized patients.

Detrusor hyperreflexia with impaired contractility (DHIC) Catagorized as a subtype of urge incontinence, DHIC recently was reported to be the most common urodynamic abnormality in a very elderly institutionalized incontinent population.[10] This condition is characterized by involuntary bladder contractions and incomplete emptying of the bladder in the absence of anatomic or neurogenic obstruction.

Diagnostic Evaluation

Hilton and Stanton[11] have developed an algorithm for the diagnosis and management of incontinence in elderly women based on results of a urine culture, history, and physical examination with emphasis on palpating the bladder after the patient has voided and on examining the patient standing with a full bladder for stress incontinence. The usefulness of this algorithm has been validated both retrospectively and prospectively.[11,12]

Ouslander and colleagues[13,14] have designed an algorithm for the diagnosis and management of incontinence in both men and women. This algorithm includes a history, focused physical examination, urinalysis with cultures, and a series of simplified "bedside" diagnostic tests that can be performed and interpreted without any special expertise in urodynamics.[13]

Treatment Options

Acute incontinence in acutely ill patients is likely to resolve with subsidence of the underlying illness. This type of urinary incontinence should be managed by scheduled toileting, toilet substitutes, and/or pads with careful attention to skin care.

Mild to moderate stress incontinence may be treated by means of pelvic floor (Kegel) exercises and use of appropriate drugs (for example, alpha-adrenergic agonists, which increase the tone of the smooth muscle around the bladder outlet, and estrogen, which has a trophic effect on the tissues around the bladder outlet and also may have effects of periurethral blood flow and alpha-adrenergic activity). Up to a third of women with stress incontinence also have detrusor motor instability.[10,15,16] Severe stress incontinence unresponsive to these treatments or associated with prominent anatomic abnormalities may be treated by means of surgical procedures involving suspension of the bladder neck.[17]

Urge incontinence is the most common type of incontinence in the elderly; it rarely is associated with a pathologic lesion in the lower urinary tract.[18,19] Women with urge incontinence and other irritative voiding symptoms may benefit from treatment with estrogen, especially if atrophic vaginitis and urethritis are present.

Overflow incontinence due to urinary retention is best treated with surgery for removal of the obstructing prostatic tissue, or in women, repair of a large cystocele. In several studies of male patients with incontinence and other voiding difficulties, over half the patients had both obstruction and detrusor motor instability.[20-22] In most cases, symptoms and detrusor instability resolved after prostatectomy.[23] Some incontinent men who undergo a transurethral resection for obstruction will continue to have symptoms of urge incontinence postoperatively due to persistence of detrusor motor instability. Although this problem usually resolves over time, patients with persistent symptoms may benefit from treatment with a bladder relaxant drug. Patients with acontractile neurogenic bladders generally require chronic indwelling or intermittent catheterization to prevent the complications of chronic urinary retention.

Functional incontinence is often accompanied by other problems, for example, detrusor motor instability or hyperreflexia. Treatment generally involves a be-

haviorally oriented toileting schedule with appropriate use of special undergarments, pads, and external collection devices, as well as environmental manipulations.

Detrusor hyperreflexia with impaired contractility (DHIC). Theoretically, patients with DHIC might respond better to bladder relaxants, but they may be at greater risk for the development of urinary retention from these drugs. The optimal approach to this previously unrecognized but apparently very common problem must be explored.

Exercise

LINDA S. MARTIN RN, MPH; CARMINE M. VALENTE PhD; and ALBERT M. ANTLITZ MD

If ever there were an antidote to the decline associated with aging, it might be physical exercise. Older people who exercise regularly tend to be those at whom we marvel: they live longer, more vigorous, independent lives. Exercise has provided them with keys to a better quality of life and cardiovascular fitness, strengthened muscles, a well-functioning nervous system, good mental health, and improved functional capacity.[1,2]

It's never too late to begin. Sedentary older individuals can improve their lives by embarking on a routine of regular exercise.[1] Primary care physicians are in an excellent position to act as counselors for good health by encouraging and instructing older patients to begin and continue exercising. However, it may not be easy to persuade older patients to be more active. Most probably have long-standing habits of inactivity, some physical disabilities, and perhaps fears of falling or having a heart attack while exercising. We suggest a brief approach to plan an individualized exercise program and effectively advise your patient. A checklist to guide and document your advice is provided (Figure 1).

Begin convincing your patient by using these steps:

1. Recommend increased activity Determine your patient's current activity level by inquiring about his or her usual type of activity, frequency, and duration.

From the Center for Health Education,Inc. Martin is a Health Education, Dr. Valente is the Executive Director, and Dr. Antlitz is Chairman of the Board of Directors.

Physicians are in a unique position to recommend more routine activity (such as walking to the store instead of riding), as well as planned exercise sessions for patients.

2. Emphasize the benefits (and defuse concerns) Explain why exercise is so important for physical and mental health. What does the patient perceive as possible benefits? Try to elaborate on those that seem most important to the individual patient: more energy, better relaxation and sleep, less anxiety, easier everyday movement, strengthened heart, weight loss, or vigorous and attractive appearance. Elicit perceived obstacles to regular exercise. Defuse concerns about injuries by emphasizing that they can be prevented with a sensibly planned, gradually implemented exercise program.

3. Evaluate patient's physical status A thorough history and physical should precede exercise as the first step in preventing injury. Particular disabilities that may affect the type or amount of exercise recommended include cardiovascular, musculoskeletal, or sensory deficits. The existence of conditions such as orthostatic hypotension or insulin-dependent diabetes mellitus also will affect your advice. Certain categories of medication interact with exercise and should be considered and perhaps adjusted (diuretics, insulin, glycemic agents, beta blockers, tranquilizers).[3] A stress test should be administered to those with any significant cardiovascular symptoms or physical findings.[4]

Help Your Patient Get Started

4. Assist with choosing an activity There are several important factors in the choice of an activity. Probably the most important, however often overlooked, is pleasure. If the activity promises to be enjoyable for an

Promotion of Continued Exercising
_____Praised patient
_____Encouraged support of family and friends
_____Recognized physical improvements
_____Helped patient anticipate excuses

individual, it is more likely to be tried or continued. Activities that are convenient, safe, and provide opportunities for social interaction also promote the exercise habit. Various types of activities tend to accomplish different physical goals. For example, gardening promotes flexibility, calisthenics promote muscular strength, continuous movement of the large muscle groups (as in brisk walking or bicycling) promotes endurance and cardiovascular fitness. The best exercise program includes all three types of movement. Recommendations should be tailored to individual abilities. For example, stretching exercises for flexibility may be a good start for a completely sedentary person.

Walking is probably the simplest, safest[5] activity and has the potential to meet all these criteria. Brisk walking, preferably with a partner, would be a good choice for most patients.[6]

5. Ask patient to make a commitment to exercise at least three times per week for 20 minutes according to an agreed schedule Encourage your patient to make exercise a part of a daily (or three times weekly) routine. To get the benefits, it's important to exercise at least three times a week for a minimum of twenty minutes. Decide together the times and days that will work in the patient's routine. A written "exercise prescription" that you (and perhaps the patient) sign strengthens your message (Figure 2). Keeping track of exercise with a written record helps establish the routine.

6. Provide information and written materials about exercising safely and effectively Issues to address include:

Warming up Begin exercise gradually and gently. Stretch muscles or walk slowly for ten minutes.

Cooling down Taper off rather than stop abruptly.

Intensity of exercise Encourage the older patient to go at his/her own pace, making very gradual increases in intensity. Intensity can be guided by the "talk test:" it should be possible to carry on a normal conversation. Or you can show your patient how to check his/her heart rate during exercise to be sure it is in an effective but safe range:

- Have patient stop briefly, check carotid or radial pulse for ten seconds, multiply by six.
- The effective but safe heart rate for an individual can be determined by: (220 - patient's age) x .60 {for 60 percent of maximum heart rate} or see Figure 3.
- The target heart rate should be 60 percent of the maximum heart rate initially; it never should exceed 75 percent of maximum heart rate.

Warning signs The patient should be cautioned to avoid overdoing it. Stop (gradually) for breathlessness, rapid pulse, or pounding heart. Contact physician for chest discomfort, extreme shortness of breath, dizziness, nausea, or persistent joint or muscle discomfort.

Extreme weather In hot or humid weather, exercise in air-conditioned facility or during coolest part of day. Dehydration is the biggest concern. Drink water before, during, and after exercise.[7] Wear loose, porous clothing. In cold weather, layer clothing rather than wear a few bulky items.

Shoes Insist on good quality shoes that provide stability and minimize strike impact.

Vision: Age-Related Macular Degeneration

SUSAN B. BRESSLER MD

Age-related macular degeneration (AMD) is the leading cause of irreversible severe visual loss in the United States among persons over 50 years old. The majority of patients who develop severe visual loss from AMD have exudative disease. Treatment for AMD has been shown to be effective for only a small portion of patients who have well-defined choroidal neovascular membranes (CNVM) outside the foveal center. Even when successfully treated, severe visual loss is postponed for only about 18 months because of the high rate of recurrent CNVMs extending through the fovea. Presently, low-vision aids are the only treatment available for the majority of patients with exudative disease.

Age-related macular degeneration (AMD) is the leading cause of severe visual loss in the United States in people over 50 years of age.[1,2] Despite its health importance, relatively little is known about its etiology, and specific treatment is possible only for selected patients with the neovascular stage.[3]

There is no universally accepted definition of AMD. Clinical manifestations of AMD include drusen and geographic atrophy of the retinal pigment epithelium (RPE), as well as retinal changes associated with choroidal neovascularization, in an individual over 50 years old. Since drusen are present in over half the population over 70 years old,[2,4] some investigators prefer to reserve the term AMD for people who have these clinical features and *some* degree of visual loss.

Clinical Features

Drusen are the earliest detectable feature. Patients generally are asymptomatic and retain excellent visual acuity; however, mild metamorphopsia and decreased central acuity may be present. Ophthalmoscopy demonstrates small yellow excrescences beneath the RPE, clustered in the posterior pole (Figure 1). Histopathologically, drusen are localized deposits lying between the basement membrane of the RPE and the remainder of Bruch's membrane. Their pathogenesis is unknown. Clinically, they vary in number, size, shape, distribution, pigmentation, and degree of elevation.[3]

One or several areas of well-demarcated atrophic RPE accompanied by choriocapillaris atrophy may be present.[5] This is termed geographic atrophy. The photoreceptors are metabolically dependent on the RPE; therefore, areas of geographic atrophy usually are accompanied by loss of the overlying photoreceptors.[6] Consequently, the development of geographic atrophy is one way in which visual loss can develop in macular degeneration. Geographic atrophy may appear *de novo* or as a result of regressing drusen[7] or following collapse of a serous detachment of the RPE.[8]

Although most patients with AMD manifest drusen only, the majority of patients who experience severe visual loss from AMD do so from the development of neovascularization and related exudative complications.[2,9] These neovascular features include choroidal neovascularization (CNVM), serous or hemorrhagic

Dr. Bressler is Assistant Professor of Ophthalmology at the Wilmer Ophthalmological Institute, Retinal Vascular Center, Johns Hopkins University School of Medicine, Baltimore.

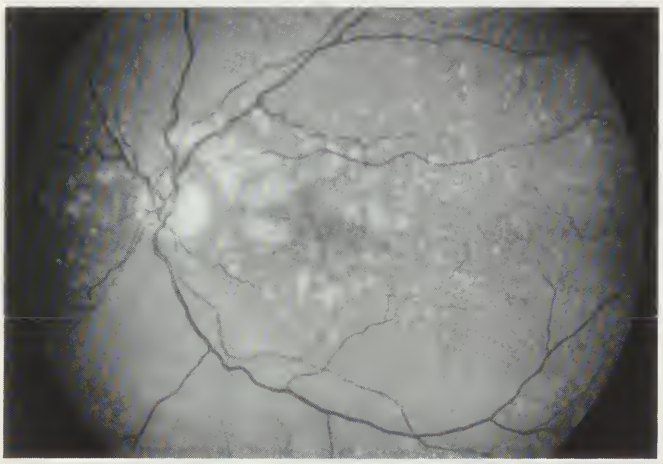

Figure 1. Ophthalmoscopic appearance of drusen. Seventy year old woman with 20/25 vision.

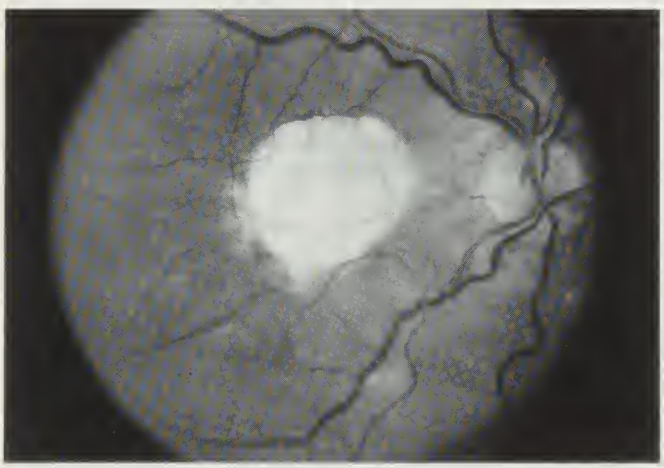

Figure 2. Ophthalmoscopic appearance of disciform scar. Seventy-five year old man with 20/400 vision.

detachments of the RPE, fibrovascular disciform scarring, and vitreous hemorrhage. Ophthalmoscopically, a CNVM appears as a round to oval, greenish-grey lesion associated with subretinal blood or lipid, and a neurosensory retinal detachment. The pathogenesis of the development of choroidal neovascularization is unknown.

The ophthalmologist or primary care physician responsible for any AMD patient must maintain a high index of suspicion that neovascularization is present whenever the patient has sudden or recent central vision loss, including blurred vision, distortion, or a new scotoma. A fluorescein angiogram should be obtained promptly (one to three days) to determine if a treatable lesion can be identified.

Most cases of untreated choroidal neovascularization progress to a fibrovascular scar that replaces most of the outer sensory retina and RPE lying between the choroid and retina. These scars are white, to yellow, or black and may be associated with subretinal fluid, hemorrhage, and/or lipid (Figure 2).

Epidemiology and Treatment

The prevalence of AMD is strongly age related. In the Framingham Eye Study 28 percent of subjects age 75 and older had AMD.[2] Other potential risk factors include a positive family history, lifetime sunlight exposure, cigarette smoking, light iris color, hyperopia, and cardiovascular disease.[1,9,10]

Currently no specific treatment has been shown to alter the natural course of nonexudative macular degeneration (drusen or geographic atrophy). Since approximately 10 to 15 percent of patients with drusen eventually may develop exudative manifestations of AMD over their lifetime, periodic ophthalmic examination is warranted. In addition, daily monitoring of the central visual field including the use of an Amsler grid chart (Figure 3) should help the patient recognize the early symptoms of subretinal fluid caused by a CNVM. Any central visual disturbance should prompt a semi-emergent reevaluation.

Laser photocoagulation can reduce the likelihood of severe visual loss in patients with well-defined CNVMs outside the central fovea. The benefit of photocoagulation is greatest one year after treatment. In the Macular Photocoagulation Study (MPS), 43 percent of untreated eyes as compared to 21 percent of treated eyes progressed to severe visual loss 12 months after treatment.[11,12] The MPS has ongoing clinical trials evaluating laser photocoagulation of CNVMs involving a portion of or the actual center of the fovea.

Unfortunately, a large proportion of patients

manifesting CNVM associated with AMD have angiographically poorly defined neovascularization.[13] To date, no specific laser therapy has been shown beneficial in this group of patients.

Once a disciform scar has developed, laser treatment is of no proved benefit.

Patients with central visual impairment bilaterally should be advised about the availability of a variety of low-vision aids, and a thorough low vision evaluation should be conducted. Patients also should be advised of the community resources available to assist people with visual impairment.[3]

Hearing

STEFFI B. RESNICK PhD, CCC-A

Estimates of the prevalence of hearing impairment in individuals over 65 years old are on the order of 30 percent.[1] Although the psychosocial consequences of hearing impairment may be profound, less than 20 percent of hearing-impaired adults use hearing aids to compensate for their hearing loss. Primary care physicians play a vital role in identifying hearing impairment in the elderly and in assisting the older adult in obtaining rehabilitative services, including hearing aids. Screening tools, which are inexpensive, simple to use, and valid, are available for use in the primary care setting.

Presbycusis (progressive hearing impairment affecting older adults) reflects the combined effects of aging, noise exposure, ototoxic medication, systemic medical disorders, and genetic susceptibility.[2] The hearing loss typically is bilateral, mild to moderate in degree, and affects hearing in the high-frequency region (above 1000 Hz) to a greater extent than hearing in the low frequencies.[3] As a consequence, the patient's complaint often is "I can hear people talking but I cannot understand what they are saying." Family members frequently report that the hearing-impaired individual "can hear when he/she is paying attention and looking at me." Thus the patient's communication difficulties may be ascribed erroneously to inattention and decreased cognitive abilities, rather than to a peripheral hearing impairment.

The management approach for a patient who presents with hearing loss is, in large part, determined by the type of hearing impairment (conductive, sensorineural, or mixed) the patient manifests.

Conductive and Sensorineural Hearing Loss

Conductive hearing loss is caused by inefficent transmission of sound from the pinna through the external auditory canal and middle ear to the inner ear. Thus, it may be caused by simple obstruction of the external auditory canal by impacted cerumen or by pathology of the middle ear such as otosclerosis, glomus body tumors, or otitis media.[4] Medical and/or surgical intervention may be indicated and may reduce the extent of the conductive hearing loss.

Sensorineural (neurosensory) hearing loss refers to hearing loss caused by lesions of the cochlea or the VIII cranial nerve.[4] In cases of sensorineural hearing loss, the patient typically reports difficulty in understanding speech in the presence of background noise and has a decreased tolerance for loud sounds. Mixed hearing loss is when both sensorineural hearing and conductive hearing loss are present.

Presbycusis is a sensorineural hearing loss reflecting primarily degenerative changes in the sensory and neural stuctures of the inner ear and, to varying degrees, degenerative changes in the central auditory pathways.[5]

The findings of an audiological evaluation can assist the physician in the differential diagnosis of the hearing impairment. The basic tools of the audiologist's repertoire are pure-tone and speech audiometry.[6] Pure-tone thresholds (the minimum intensity at which pure tones are audible to the patient) are determined and compared with the normative values for young adults to estimate the degree of hearing loss. Further comparison of the air-conduction thresholds (obtained when the tones are presented via earphones) with the bone-conduction thresholds (obtained when the tones are presented via a vibrator behind the ear to stimulate the inner ear, bypassing the middle ear) permits assessment of the degree of conductive involvement. The sensitivity of those measures for distinguishing between conductive and sensorineural pathology is enhanced by the audiologist's use of tympanometry.[7] Tympanometry permits assessment of the efficiency of the middle ear system by introducing systematic changes in air pressure in the ear canal. Tympanometry is of assistance in the identification of middle ear disorders such as otosclerosis and Eustachian tube dysfunction.

Speech audiometry is used largely to determine the patient's ability to identify single syllable words when the words are presented at a level that is clearly audible. Word identification scores (speech discrimination scores) may be used to predict the patient's ability to benefit from use of a hearing aid.

Screening

The traditional approach to identifying hearing impairment was to screen hearing at levels of 40 dB above normal hearing threshold at selected frequencies. Thus, hearing screening required use of trained person-

The author is an audiologist in independent practice and a Fellow of the American Speech-Language-Hearing Association.

nel and an audiometer and was too costly and time consuming to be practical within a primary care setting. Two recent developments have made screening in the primary care setting cost effective, simple, and practical: (1) the formulation and validation of a ten-item self-report questionnaire (the HHIE-S);[8] and (2)the manufacture of the Welch-Allyn audioscope, a hand-held otoscope that incorporates a signal generator and automatically delivers a tonal sequence at the prescribed screening level. The sensitivity, validity, and reliability of both the self-report questionnaire and the audioscope as screening tools for identifying hearing impairment in elderly patients has been demonstrated.[9]

Counseling the Hearing-Impaired Patient

Physicians play a vital role in the identification of hearing loss in the elderly and in encouraging use of a hearing aid when warranted.[10] Despite the psychosocial consequences of hearing impairment,[11] hearing aids are obtained by fewer than 20 percent who need them.[12] The limited use of hearing aids is, at least in part, a reflection of the advice patients receive from their physicians and other health care professionals.[13]

Technological advances in the manufacture of hearing aids and research on hearing aid selection have made it possible to meet the needs of the majority of hearing-impaired older adults. The extent to which a person may be anticipated to benefit from the use of a hearing aid depends on the extent and characteristics of the hearing loss, as well as on the communication needs of the patient and on his or her motivation to use amplification.[14] Common misconceptions persist regarding the use of hearing aids by individuals with sensorineural hearing loss, however those with poor speech understanding or with limited tolerance for loud sounds can benefit from use of a hearing aid, provided the instrument is selected appropriately, the patient is adequately counseled regarding its use, and follow-up services are provided. The patient who is not in a position to use a personal hearing aid may benefit from the use of other assistive listening devices, such as a telephone amplifier, a personal infrared system, or closed caption device for use with TV.

Two sources of consumer information for the hearing-impaired patient are the National Association for Hearing and Speech Action, Rockville, MD (301-897-8682) and Self-Help for Hard of Hearing People, Bethesda, MD (301-657-2248).

Sexuality

PAUL H. EPHROSS PhD

Empirical research, clinical experience, and greater sophistication about the interaction of social, psychological, and biological factors have produced marked changes in the appreciation of the importance of sexuality in older persons. An earlier view linking sex exclusively with reproductive function has given way to a holistic view of sex as vital to self-concept, the maintenance of healthy interpersonal relationships, and a sense of integrity. Older adults often have difficulty communicating sexual problems, concerns, and questions because of their conflicting attitudes and perceptions. Sexual problems often are presented covertly, expressed in vague terms, or masked by embarrassment. Physicians need to be aware of the possibility of covert sexual dysfunctions, clear about their own attitudes and expectations to avoid stereotyping the elderly, and knowledgeable about pharmacological, organic, and psychosocial bases of sexual problems in older patients.

Views of geriatric sexuality have undergone profoundly meaningful changes over the past 50 years. Earlier views related sexuality so thoroughly to reproductive function that sexual activity of older adults was viewed as either unimportant or as aberrant. Stereotyped views of the elderly as "dirty old men" or as "old witches" not only pervaded folklore but also made their way into purportedly scientific literature in the health sciences.[1] Other reasons for the comparative neglect of the sexuality of older persons have included an association of sexual attractiveness with youth, psychological resistance to viewing older persons as sexual active, the unfashionable views of geriatric sexuality as a topic for research, and the resulting lack of high quality empirical research.

Advances over the past two decades, however, have produced a consensus about the complexity and importance of sexuality in the later years of life that may be summarized as: (1) sexual expression continues throughout life and is inextricably intertwined with both physical and mental health; (2) sexual expression includes much more than merely erectile and orgasmic potency; (3) sexual dysfunction is not an inevitable concomitant of aging but rather should be viewed as treatable; and (4) sexual function, as well as dysfunction, involves a complex and interactive system of social, psychological, organic, and biochemical variables.[2]

Today's older adults have lived through major changes in societal attitudes. As a result, they often manifest reticence, embarrassment, and ambivalence regarding their own sexual concerns. It is the physician's responsibility to recognize that concerns about sexual function and dysfunction may underlie complaints about ill-defined symptoms, vague and sometimes meandering reports of interpersonal tensions and difficulties, and other seemingly unfocused communications. Sexual concerns also may be expressed covertly through anxious and sometimes poorly expressed questions about the possible side effects of medical or surgical treatments, by resistance to cooperating with medically prescribed regimens, and by demands for the physician to meet directly with spouse or partner to explain findings.

Preliminary evaluation of sexual dysfunctions requires effective communication: careful use of words that are comprehensible to elderly patients. Words with which a physician is comfortable may be outside a patient's vocabulary or may have unintended connotations for patients of a particular racial/ethnic background. One should not assume understanding but should probe for it. Physicians need to be aware that they may themselves hold negative attitudes toward subjects with which patients are uncomfortable (masturbation, for example) and also should be aware that the elderly, like other segments of the population, are not monolithic but vary considerably in the intensity of their sexual interests and behaviors.[3]

Though gaps still exist in research on the sexuality of older persons,[4] it is clear that careful evaluation of sexual dysfunction in older persons should include consideration of at least the following factors:[5]

1. The availability of a desirable partner in the light of the total social situation of the patient
2. The general level of mental health of the patient, with particular emphasis on the presence of depressive symptomatology
3. Gynecological and urological evaluation, sometimes hormonal studies
4. The presence of disease processes that are known to have negative effects on sexual function of some persons, such as diabetes and various neurological

The author is Professor, School of Social Work and Community Planning, University of Maryland at Baltimore.

conditions, as well as the presence of debilitating symptoms, such as chronic pain
5. The effects of disfiguring surgery and of chronic symptoms, such as limited mobility, that interfere with self-image of the elderly person as sexually desirable
6. The potential effects of the use and abuse of "recreational" drugs, most notably alcohol, on sexual function
7. The potential effects of prescription drugs, several classes of which can have negative effects on one or more phases of the sexual desire-arousal-orgasm progression[4]
8. For patients living in congregate or institutional settings, the effects of sex-negative and often personally degrading policies and procedures that can dehumanize and therefore desexualize older persons
9. Specific dysfunctional cognitive, attitudinal, or behavioral patterns that operate to prevent healthy and satisfying sexual expression

An essential element of sexual counseling that can be provided by virtually all physicians who come in contact with elderly is permission giving; that is, giving the older person permission to be sexual, to have sexual concerns, and to seek sexual fulfillment. Past this, referral to a skilled sex counselor or therapist should be undertaken.

Finally, particular note should be taken of the sexual needs and concerns of older persons who are recovering from acute illness, such as myocardial infarction, or are chronically ill. Within very broad limits, no condition should be viewed as eliminating sexual concerns or interest. Where a younger person confined to a wheelchair, for example, may raise sexual concerns directly, an older patient whose mobility is limited may not. If this is this case, it is usually appropriate for the physician to raise the issue, bringing into focus the concerns that almost always exist for the patient.

Immunization

ALAN LEVITT MD

The elderly are frequently underimmunized against vaccine-preventable infectious diseases. Comprehensive immunization of patients for vaccine-preventable diseases represents a major challenge for physicians treating the elderly. The healthy elderly should be specifically targeted since they are most likely to mount an appropriate immune response to the vaccine. Programs to identify inadequately immunized patients should be widely implemented.

Childhood vaccination programs nearly have eradicated vaccine-preventable childhood infectious diseases. Despite widely accepted and published guidelines,[1-3] immunization programs in adults, specifically the elderly, have been much less successful in disease eradication. Three targeted immunizations for the elderly are tetanus toxoid, influenza vaccine, and pneumococcal vaccine (Table).

Tetanus Toxoid

Seventy percent of the reported cases of tetanus (less than 100 cases yearly) occur in adults over 50.[4] The case fatality rate is eight times higher (42 percent) for tetanus patients over 50 than for younger patients. Despite this,

Dr. Levitt is Assistant Professor of Medicine, Division of General Internal Medicine, University of Maryland, Baltimore.

Table. Immunization Schedule for the Elderly*

Immunization	Schedule
Tetanus-diphtheria toxoid (Td) (0.5 cc IM dose)	Primary: 2 doses 4-8 weeks apart; 3rd dose 6-12 months after 2nd dose Booster: 1 dose every 10 years
Influenza vaccine (0.5 cc IM dose)	Annual vaccination with updated vaccine
Pneumococcal vaccine (0.5 cc IM/SQ dose)	Single vaccination

*See ACIP guide[1] for other immunization recommendations in adults.

primary immunization with tetanus toxoid in the elderly is highly effective; development of protective antibody levels in healthy elderly outpatients approaches 100 percent.[5]

Inadequately immunized adults should complete a primary series of three doses of toxoid, the first two doses given 4 to 8 weeks apart and the third given 6 to 12 months after the second.[6] Adults with adequate prior immunization should receive booster doses at 10-year intervals. Giving the booster doses routinely at the mid-decade ages (55 years, 65 years, etc.) may improve compliance. Prophylaxis for tetanus in wound management is guided by the prior immunization status of the patient and the severity of the wound.[6] The recommended toxoid is the combined tetanus and diphtheria toxoids adsorbed (Td). Mild local reactions commonly occur at the injection site. Severe Arthus reactions may occur in adults receiving frequent toxoid doses. Systemic complications or neurologic reactions are rare; contraindications are prior severe reactions.

Influenza Vaccine

Eighty to 90 percent of the estimated 20,000 annual influenza-associated deaths occur in the elderly.[7] Elderly patients who are institutionalized or who have chronic health problems are at a substantially increased risk for complications.[8] Antibody response to the influenza vaccine in the elderly may be delayed with a diminished peak response and an earlier decline in protective levels.[9] Vaccine efficacy in the institutionalized elderly is decreased; patients are protected from lower respiratory complications, hospitalization, and death rather than from actual clinical illness.[10] In the healthy elderly, however, vaccine efficacy appears to match that of the younger patients.[11]

Because inactivated trivalent influenza virus vaccine is updated yearly based on circulating worldwide influenza virus activity,[12] it needs to be given intramuscularly every fall. Side effects include localized soreness and erythema or, occasionally, mild constitutional symptoms. Immediate hypersensitivity reactions occur rarely, usually in patients with severe egg allergy; thus the vaccine should not be given to patients with known hypersensitivity to eggs. The vaccine contains only killed virus and cannot cause influenza, nor is there increased risk for developing Guillain-Barre syndrome as was seen with the swine influenza vaccine. Chemoprophylaxis with amantadine can be given during outbreaks of influenza A (for discussion of current chemoprophylaxis recommendations, see reference 12).

Pneumococcal Vaccine

The incidence of pneumococcal disease is increased twofold in those over 60[13] with fatality rates ranging from 17 to 40 percent.[14] The efficacy of the pneumococcal vaccine in the elderly in preventing disease has been controversial. While the vaccine has a 70 percent effectiveness in preventing disease in a healthy elderly population,[15] the efficacy of the vaccine in high-risk elderly patients has been disappointing.[16] Efficacy is most likely related to the patient's ability to mount an appropriate immune response to the vaccine.

Despite the controversy, routine pneumococcal vaccination is recommended in both the healthy and "high-risk" elderly (those with cardiovascular disease, chronic pulmonary disease, splenic dysfunction, or other conditions associated with immunosuppression).[13] The current pneumococcal vaccine contains the capsular polysaccharides of the 23 types of *Streptococcus pneumoniae* that cause 87 percent of pneumococcal bacteremia in this country. A single vaccination provides persistent antibody titers for at least three to five years. Revaccination is not recommended due to Arthus and systemic reactions seen with "booster" doses. Patients who received the older 14-valent vaccine should not be reimmunized. Side effects from single vaccination include pain and erythema at the injection site. Fever and myalgias occur in less than 1 percent, and anaphylaxis is rarely seen. Pneumococcal and influenza vaccination can be given during the same visit in separate sites without increasing adverse reactions.

Immunization Strategies

Despite the documented efficacy of adult immunization, most elderly persons are not properly immunized. Almost half of all adults older than age 60 lack protective levels of antibody.[5] Less than 20 percent of high-risk individuals receive the influenza vaccine, and only 10 percent of adults with recommended indications report having received the pneumococcal vaccine.[17]

Congress has mandated a two-year study of Medicare coverage for influenza vaccination. Financial reimbursement for pneumococcal vaccination by Medicare since 1981 has not significantly improved vaccine use.[17]

Strategies and programs, both on an inpatient and outpatient basis, have been developed in an attempt to increase vaccination rates. Routine assessment of the immunization status of every elderly patient should be

done at each office visit and hospital admission. Adult immunization records should be part of the permanent patient record. Immunizations can be successfully given at hospital discharge[18] or in conjunction with influenza vaccination.[19]

NOW
MAGNETIC RESONANCE IMAGING
AT ST. AGNES HOSPITAL

Inpatient and Outpatient Service Offered

New MR MAX System provides clinical flexibility and quality to image all parts of the body. The Program is under the direction of John N. Joslyn M.D., and Lyle T. Saylor, M.D., Chairman of the Department of Diagnostic Imaging.

MRI Service available Monday, Wednesday, Friday —7 A.M. to 6 P.M.

Physician referrals for appointments call 301-368-3039.

St Agnes Hospital

900 Caton Avenue, Baltimore, Maryland 21229
The Science of Medicine—The Art of Caring

What is PDS?

PDS is a professional service company for physicians. PDS helps the physician obtain the best benefit for the disabled patient who is applying for Social Security Disability Insurance benefits or seeking vocational rehabilitation.

- **Team up with PDS** and help disabled patients get benefits sooner. You examine the patient, order tests, and furnish results to a nurse from our directory.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

PdS

PHYSICIANS' DISABILITY SERVICES, INC.

Professional Support to Physicians of Social Security Disablity Applicants

Only physicians may employ PDS.

Pharmacotherapeutics in the Elderly

PETER P. LAMY PhD, ScD

Drugs are the most cost-effective modality of chronic care, and older adults with multiple illnesses often need multiple drugs. Because this may lead to drug interactions, adverse drug effects, and problems with compliance, drug regimens should be individualized and as few drugs as possible used. When a new drug is indicated, it is important for the physician reassess the appropriateness and continued need for the existing regimen. Patients and providers must agree on a particular regimen, its goals, promises, and limitations.

According to the National Institute on Aging (NIA), the elderly probably take between four and five drugs, at any one time. Women use more drugs than men. Drug use increases with age, but declines among the very old.[1] Both the number of drugs and the amounts given have continued to increase. It has been established that elderly patients may receive between 17 and 20 prescription drugs annually. Nursing home residents receive an average of 6 to 7 drugs daily, but one-third of them receive between 8 and 14 daily. Those cared for in the alternate care sector, for example board and care, receive close to 6 drugs daily.[2]

According to the National Medical Care Utilization and Expenditure Survey conducted in 1980, 50 percent of patients over 65 are classified as "heavy users" of prescription drugs (8 or more Rx/year) with a mean of 15 Rx/year. Significantly, 20 percent of the elderly are classified as nonusers. Those 60 and over (17 percent of the population) account for 39 percent of all prescription drugs dispensed, and those 65 and over (12 percent of the population) for 32 percent.[3,4] It is estimated that 70 percent of all prescription drugs dispensed to elderly are chronic care drugs. Prescription drug use and drug use patterns are described in Tables 1-3.

Statistics on nonprescription drug use by the elderly are scarce. An estimated 60 percent of elderly patients use these drugs, and it has been predicted that their use will increase sharply as a cost-saving measure and as more prescription drugs (for example, cimetidine, ranitidine) are switched to over-the-counter (OTC) status. In general, OTC drug use closely parallels prescription drug use. Unfortunately, physicians do not appreciate the potential interactions of OTC and prescription drugs.

Consequences of Polymedicine

Concern has been expressed about the possibility of adverse drug reactions (ADRs) among the elderly. The American College of Physicians reported that the cost of ADRs to society is "substantial." Those 65 and over face twice the risk of iatrogenic disease that younger

people do. Admissions to hospitals due to ADRs vary between 12 and 15 percent, but when other factors are considered, almost 27 percent of those using multiple drugs are admitted at one time or another due to adverse reactions. In one study of a geriatric population, 31 percent of hospital admissions were associated with undesired drug effects.

An increased prevalence of ADRs in the elderly has been documented, from 10.8 percent (those taking one drug) to 27 percent (those taking six). The 1987 FDA ADR report shows that people over 60 were associated with 33 percent of all hospitalization reports due to ADRs and 50 percent of all death reports. Importantly, 80 percent of all ADRs occur with well-known drugs and involve toxic reactions to their usual doses. Major factors are multiple drug use, poor supervision of chronic drug use, patient nonadherence to an agreed regimen, and lack of application of current knowledge on the part of the provider.

Yet there is still a relative uncertainty as to the probability and magnitude of adverse drug effects in the elderly. The problem may be more serious than indicated.

Drug Interactions

Drug interactions often result in adverse drug effects. They occur most often in long-term care institutions, in patients with multiple pathology, receiving multiple drugs. Most interactions(about 75 percent) are predictable and avoidable by adjustment of dose or administration times, or by selection of an appropriate alternate drug.[5,6] The drugs most often involved are not necessarily new and exotic drugs but old and well-known chronic care drugs.

Few data are available on this type of drug interaction, perhaps because the outcome may be confused with loss of effectiveness of a drug which had previously controlled a particular disease. It could also be confused with a worsening of a disease previously controlled. For example, hepatic dysfunction, severe CHF, and acute pulmonary edema can decrease theophylline clearance and clearance can again be altered when these diseases start to respond to treatment. Patients most at risk are those with an acute exacerbation or unstable disease, kidney or liver dysfunction, and those seeing more than one prescriber. The frequency of drug interactions rises and falls with the number of drugs prescribed. Clinically important interactions may occur in about 6 percent of patients at risk.

There are many different types of drug interactions as shown in Table 4. Most attention has been focused on drug-drug interactions, to the exclusion of the more serious types often encountered in long-term care. Cumulation of side effects is a serious hazard to many elderly patients receiving multiple drugs. Many drugs, prescribed for different therapeutic purposes, may have the same side effect, and their total may lead to serious adverse effects. For example, many drugs are capable of causing transient cognitive disorders, such as delirium, as well as anxiety, depression, insomnia, or undue sedation. Among them are diuretics, analgesics, antihistamines, antiparkinson drugs, antidepressants, beta blockers and other cardiovascular drugs, antipsychotics, cimetidine, and digitalis.

Drugs can alter food metabolism, which in turn can alter drug action. Foods may alter the bioavailability of many drugs. Long-term administration of drugs to elderly with subclinical malnutrition can deplete the patient of specific nutrients, and the deficit may manifest as a disease or problem, such as pseudosenility or difficulty in walking. About 2 percent of the elderly are affected.[7]

Discontinuing Medications

Once chronic care drug therapy has been initiated, it is often, but perhaps mistakenly, believed that permanent drug maintenance will be needed. In view of the facts that drug use may adversely affect a patient's quality of life and that multiple drug use is the major factor responsible for adverse drug effects, there have been more suggestions that chronic drug therapy may not be needed in some instances for some patients and may be undesirable.

Inappropriate duration of use has recently been documented for H-2 blockers and benzodiazepines. As long ago as 1970, it was suggested that most old people on maintenance digoxin did not need the medication and would not relapse into heart failure when it was withdrawn.[8] The US Congress, in passing OBRA 1987, manifested its concern about the inappropriate use of psychotropics; and the Joint National Committee, in its most recent guidelines for the treatment of hyperten-

sion, suggested that providers consider "step-down" therapy.

In considering discontinuation of a medication for an elderly patient, one must remember that abrupt withdrawal may be dangerous and that the most common syndrome associated with discontinuation of any drug is a rebound phenomena of some type. Furthermore, few guidelines are available for withdrawal of drugs from an elderly patient's multiple drug regimen.

Benzodiazepines There is consensus that these drugs are not effective long term, either as sedatives/hypnotics or as antianxiety agents.[9,10] The elimination half-life, duration of treatment, and dose used affect the appearance, manifestation, and duration of withdrawal effects. When two benzodiazepines have similar dependency/tolerance potential, the shorter acting one will cause withdrawal symptoms to manifest more quickly.[11] Delayed onset of sleep and frequent awakenings may occur, as may psychological, physiologic, and perceptual disturbances. They may resemble the insomnia or anxiety originally treated and may be confused with return of these problems. Withdrawal symptoms, which may last from a few days to a few weeks, may be ameliorated by slow, tapered withdrawal. Substitution of a longer-acting benzodiazepine prior to withdrawal has been recommended.

Anticonvulsants The number of seizures a patient had before control was achieved, the type of seizure, the number of drugs tried as single-drug therapy, and the type of treatment all influence withdrawal outcome. Withdrawal can be considered for patients free of seizures for two years. In general, the relapse rate is higher in adults (about 34 percent) than in children. Complex partial seizures carry a good prognosis, and partial seizures indicate a lower risk of relapse. Relapse is perhaps more likely on withdrawal of sodium valproate than of carbamazepine. The risk of relapse is reduced if treatment is withdrawn over three months, although a withdrawal period of from six to twelve months has been suggested.[12]

Antidepressants Discontinuation of antidepressant therapy after remission of depressive symptoms is an attractive idea but should be considered carefully.[13,14] The discontinuation of tricyclic antidepressants can produce symptoms suggesting cholinergic overdrive. If unsuccessful, further episodes of depression are usually more severe and more treatment resistant. If there is a history of relapse, withdrawal may not be effective.

It has been suggested that for six months after symptom remission, maintenance treatment be continued, either at the treatment dose or half. Two-thirds of the treatment dose also has been proposed. Another recommendation is that the patient should be maintained on the treatment dose for four to six months after remission of symptoms. That dose should then be reduced to half the initial dose for another four months, then the remaining dose should be gradually tapered off during another four months. Some suggest that initial maintenance on the treatment dose may significantly reduce the relapse rate. Patients should then be carefully followed to identify prodromal symptoms indicative of relapse. Patients whose initial episode of depression responded rapidly to tricyclic therapy may be the best candidates for withdrawal.

Digitalis Recently 16 studies (487 patients) addressing digitalis withdrawal were evaluated. These studies, for various reasons failed to answer the questions on methodology and effectiveness of withdrawal. Most authors agreed that digitalis, given over time is not clinically beneficial to patients with stable CHF.[15] Overall, it is agreed that a cautious trial of digitalis withdrawal may be warranted in selected elderly patients with stable congestive heart failure, particularly in view of the fact that probably 20 percent of elderly receiving this drug may suffer from unrecognized digitalis toxicity.

Antihypertensives The suggestions that antihypertensive treatment may be successfully withdrawn stem from the hypothesis that the "barostat" mechanism in the carotid sinus might be re-set to a lower, more effective level by treatment. The literature varies widely in describing the effectiveness and dangers of withdrawal. In the Netherlands, it has been estimated that only 6 percent of community living hypertensives may be suitable candidates for withdrawal, with a final figure of 3 percent remaining treatment free after one year.

Another report finds that perhaps 15 to 50 percent of patients may remain normotensive after treatment withdrawal. Of patients willing to "give up" the medication, those most likely to remain normotensive are nonoverweight women with normal ventricular mass and untreated blood pressure in the mild hypertension range, well controlled by treatment, and treated for several years. These are patients at low risk of cardiovascular events who might have responded to dietary manipulation and elimination of other risk factors. Those unlikely to respond favorably are males with a high level of pretreated blood pressure, marked obesity, short duration of treatment, and left ventricular hypertrophy.[16]

Patients with end-organ damage are not suitable candidates for withdrawal. Old people on long-term diuretic therapy without an obvious current indication should have these drugs withdrawn under careful supervision, because of the risk of heart failure, especially left ventricular failure. Thus, supervision is important and the degree of supervision necessary may not be available in the home care sector.[17]

Abrupt withdrawal of clonidine (a centrally acting drug) or beta blockers may result in severe hypertension due to enhanced sympathetic activity or "upregulation" of adrenergic receptors.[18] Patients with ischemic heart disease may develop acute coronary artery syndrome within weeks after abrupt withdrawal of beta blockers. Those without ischemia may complain of palpitations, tremor, sweating, and discomfort associated with tachycardia and a rise in blood pressure.[19] After propranolol withdrawal, the rise in blood pressure is more rapid in younger than in older patients.[20] Withdrawal should be phased, with a reduction of dose by 50 percent over the first four days and consecutive 50 percent reductions at four-day intervals.[18]

Nonadherence to a Regimen

The patient's adherence to an agreed regimen results from a complex interaction between the patient, the caregiver, the provider, the disease, and the treatment. While this complex structure still is not being satisfactorily understood, attempts to apply compliance measures, although successful in acute care, have failed in the outpatient care sector. As many as one-third of elderly patients may commit drug administration errors that could lead to serious clinical consequences. For those found to make frequent errors, the physician should pay particular attention to possible cognitive impairments. Drug discontinuation may occur up to 50 percent of the time, particularly within the first year of the initiation of a chronic care regimen. Almost 25 percent of the elderly may be taking drugs not currently prescribed, and it is most likely that many patients alter drug regimens to conform to their own activities.[3]

Characteristics of patients who may take their medications unreliably have not yet been identified, but it is known that those living alone make more medication errors than do others. Estimates indicate that only 55 percent of tuberculosis patients, 48 percent of diabetics, 46 percent of asthmatics, and 42 percent of glaucoma patients use their medication properly.[22] Yet patients and physicians often overestimate adherence.

Patients continue to be far from candid, possibly trying to avoid embarrassment or an argument with an "authority" figure or simply believing the issue is not important. Factors associated with nonadherence are alcohol abuse, child-proof containers, inconvenience/inability to get appointment, life-style changes, long waiting times, obesity, poor social support, poor general health, and treatment duration, complexity, or cost.

*For those found to make frequent errors, the physician should pay particular attention to possible cognitive impairments.

Patients must understand a particular regimen, its goals, promises, and limitations. In turn, the provider must understand the patient and his or her motivation, health beliefs, and social, economic, and health status. The provider must understand whether the patient can and will follow an agreed-on regimen. Patient satisfaction has been related to technical and interpersonal competence of the provider, more partnership building, more immediate and positive nonverbal behavior, more positive and less negative talk, and more communication overall. The following behaviors and actions may augment the patient's ability and willingness to actively participate in long-term chronic therapy.

Good provider-patient (caregiver) relationship
Continuity of care (same provider)
Increased supervision
Explicit verbal and written instructions
Feedback to patient (caregiver)
Tailor medication to patient's daily schedule
Negotiated (written) contracts
Heightened family, social support
Patient appointment reminders

GOOD MEDICINE FOR YOUR GERIATRIC PATIENTS, NOW AVAILABLE IN TWO CONVENIENT FORMS.

KESWICK ADULT DAY CARE

Providing a welcome break for the elderly and their caregivers, the Adult Day Care Center is:
- an affordable, high-quality alternative to early institutionalization and costly home care.
- for people with Alzheimer's, senile dementia, Parkinson's, stroke victims, and seniors who live alone or need care during the day.
- open weekdays, 9:30 a.m. to 3:30 p.m., with extended hours available.
- an enriching environment designed to meet participants' physical and psychological needs, and preserve their sense of dignity. **For more information, call (301)235-8860, ext. 311.**

At both the Domiciliary Care Center and the Adult Day Care Center, the Keswick staff of geriatric specialists works with each patient's private physician to ensure that proper medical care and support services are provided.

Patients requiring care appropriate to these institutions are admitted without regard to race, color, creed, sex or, national origin.

KESWICK DOMICILIARY CARE

A warm, homelike facility for the independent elderly who need a safe, supervised environment, The Domiciliary Care Center features:
- beautifully decorated, all private rooms.
- 24-hour security.
- daily housekeeping services.
- three nutritious meals a day in the Garden Dining Room.
- a wide variety of planned social and recreational activities.
- daily monitoring of residents' general health and well-being.

For more information, call (301) 235-8860, ext. 255.

Rehabilitation in the Elderly

JAMES P. RICHARDSON MD, MEL P. DALY MB, ChB, and ALAN M. ADELMAN MD, MS

Prevention of disease should be every physician's goal, however, when primary or secondary prevention fail, rehabilitation of the patient becomes an additional goal. Elderly patients can be as successfully rehabilitated as younger patients, but their special needs are most successfully met by a multidisciplinary team. Almost every patient with a disability warrants a trial of rehabilitation aimed toward placing the patient in the least restrictive environment possible. Rehabilitation is especially useful in patients with arthritis, and following stroke, joint replacement, and amputation.

While prevention of disease always should be the goal of physicians, many patients, especially the elderly, will first present to the physician with long-established functional impairments and chronic diseases. In these patients, additional goals are prevention of progressio of disease and restoration of function, that is, rehabilitation.

Rehabilitation has been defined as "the process of helping an individual with a significant disability to achieve his or her highest potential from physical, psychological, social, and vocational/economic standpoints."[1] When applied to the care of the elderly, the concepts of rehabilitation, which emphasize patients' functional abilities rather than their diseases, can help a bedbound patient to regain some mobility, a chairbound patient to walk, and housebound patient to become a more active part of his/her community. The principles of rehabilitation medicine should be known to all who provide primary care to the aged. Caring for elderly patients within the traditional medical model (which focuses on the diagnosis of disease, rather than on function) shortchanges those whose impairments are their principal concern.

As the US population ages, the number of disabled persons increase because many disabling conditions are age-related (for example stroke, amputations) and because many younger people with disabilities now survive to the senium.[1] Excluding institutionalized elderly, the percentage who need help doing everyday activities doubles with each successive decade up to age 84 and triples between ages 85 and 94.[2]

Assessment

When an elderly person suffers a catastrophic and disabling event, hospitalization is usually necessary to stabilize the patient and to begin treatment. As soon as the patient is stabilized, the assessment process should begin. Functional assessment evaluates the patient from the standpoint of what the patient can and cannot do in all spheres: physical, mental, social, and psychological. The patient's particular diagnoses and functional abilities must be noted in relationship to his/her home environment, family relationships, desires, and social services available. Medical diagnosis alone often falls short; a diabetic man with an above-knee amputation and an able-bodied spouse, for example, may not have the same needs as a similar patient who lives alone.

Where possible, geriatric patients with disabilities re best evaluated using a team approach. The team may consist of only a physician, a nurse, and a social worker, or may include members of virtually all health care disciplines, including the primary care physician, physical and occupational therapists, speech therapist, recreational therapist, dentist, psychiatrist, and a physiatrist (a specialist in rehabilitation medicine). The assessment process guides the rehabilitation team in formulating an appropriate rehabilitation plan and establishes a baseline to judge future progress. After each discipline has evaluated the patient, all team members meet to decide on short- and long-term goals. These goals are then monitored every one to four weeks.

Assessment consists of several components, not all of which have to be performed by the physician. The components of a good initial assessment are (1) history and physical, (2) functional assessment, (3) mental assessment, and (4) social assessment.

Physical assessment serves three purposes. First, the functional deficit is identified. Second, concomitant medical conditions such as pulmonary and heart disease and arthritis, which may impede the rehabilitation process, are scrutinized. And third, physical assessment seeks to identify previously unrecognized problems such as visual difficulties and swallowing dysfunction following a stroke.

Functional assessment evaluates the patient's ability to perform such functions as dressing, transferring (moving from the bed to a wheelchair), bathing, and grooming. The patient's ability to ambulate and to maintain continence also is examined. These functions are referred to as activities of daily living (ADL). Function is usually rated on a three point scale: independence, assistance of an adaptive device or person, and total dependence. A commonly used functional

The authors are with the Division of Geriatrics, Department of Family Medicine, University of Maryland School of Medicine, Baltimore. Dr. Richardson is an Assistant Professor of Family Medicine and Assistant Medical Director, Deaton Hospital and Medical Center. Dr. Daly is Head of the Division of Geriatrics. Dr. Adelman is Assistant Professor in the Division and Medical Director, Supportive Care Unit, Kernan Hospital.

assessment tools is the Barthel Index, first described in this journal.[3] Other frequently used instruments are OARS Physical ADL[4] and Kenney Self-Care Assessment Tool.[5] Another part of the functional assessment involves grading the patient's ability to perform more complex activities such as cleaning, meal preparation, shopping, and managing finances. These activities are rated similarly, using a three-point scale. Ability to perform these activities may determine whether an individual can live independently in the community. The OARS Instrumental Activities of Daily Living (IADL) is an easily administered instrument to assess these activities.[4]

Mental assessment centers on the evaluation of cognitive and psychological function. The presence of dementia in a patient is a strong predictor of poor outcome from rehabilitation. There are numerous tools for assessing cognitive function. Several short instruments are available such as Kahn's mental status questionnaire (MSQ).[6,7] A longer instrument such as the Folstein Mini-Mental State Examination (MMSE)[8] is a more comprehensive screen, yet can be completed in less than ten minutes.

Conditions leading to rehabilitation usually involve a loss of function (stroke, hip fracture) or loss of limb (amputation). Depression or feelings of sadness often are associated with this loss and can hinder the rehabilitation process. Instruments such as the Beck,[9] Zung,[10] or CES[11] depression scale are good screening tools and can provide a baseline for future measurements of the patient's affective state. The Yesavage scale has been validated in elderly populations.[12]

Social assessment includes evaluation of the physical environment, social support, and financial resources. Early in the rehabilitation process, discharge planning is initiated with the goal of placing the patient in the least restrictive environment possible. In the case of the frail elderly, a visit to the patient's home is essential if the patient will be returning there. The physical layout and safety of the home environment should be evaluated. For example, if there are stairs in the home, training in stair climbing should be included in the rehabilitation program. Modifications of the home (especially the bathroom) to accommodate a disabled senior are often overlooked. The patient's social support network (family and friends) are an important resource for the rehabilitation candidate. There may be many adjustments by the patient and his/her family as a result of the deficit, so the family and/or caregiver must be involved in the rehabilitation process from the beginning.

Finally, the patient's financial resources must be considered. Finances may determine the location of rehabilitation, whether inpatient or outpatient. Likewise, the purchase of adaptive equipment and modification of the home environment may be affected by the individual's financial resources.

Rehabilitation of Patients with Specific Disease Processes

Stroke Cerebral vascular accidents constitute the third leading cause of death in the United States and are among the leading causes of morbidity. Two-thirds of completed strokes occur in over 65 years old.[13] The functional consequences are often serious. Rehabilitation produces its best results when started within 48 hours of the event.

The goals of rehabilitation for stroke patients are to prevent further complications, to compensate for physical loss, and to minimize social and economic loss by restoring or maximizing functional ability. The major determinants of functional prognosis are the degree of early recovery, the patient's functional status before the stroke, the presence of supportive caregivers and environment, the patient's ability to learn, and the patient's motivation.

It is estimated that with the help of rehabilitation, 90 percent of patients can be taught to get out of bed, 60 percent can become self-sufficient, and 30 percent of those in the employable age group can return to work.[14] Rehabilitation efforts are less successful in the very elderly, in those with severe underlying cardiac or pulmonary disease, and in patients with underlying cognitive deficits. Patients with left-hemispheric lesions tend to have better functional outcomes although aphasia, alexia, and apraxia may severely limit rehabilitation efforts. Severe sensory loss and the presence of "neglect" are also poor prognosticators for independence. Incontinence of bowel and bladder are common early on, but few patients with otherwise good potential will suffer prolonged incontinence. Prolonged bowel incontinence is a particularly poor sign, probably because the cerebral lesion necessary to create this condition is quite large.[15]

Emotional lability and depression are common but if recognized and treated properly usually respond to therapy. Poststroke depression usually meets DSM-IIIR criteria for a major depressive episode and is not merely a reactive phenomenon, as Robinson, Price, and their coworkers have shown.[16] The antidepressant nortriptyline has proved effective in improving poststroke depression in one placebo-controlled trial.[17]

All patients deserve a trial of rehabilitation. Even in the presence of the poor prognosticators noted above, a significant number of patients will benefit from rehabilitation. Almost all stroke victims should have at least a two week trial of therapy.[18]

Arthritis Chronic forms of arthritis are extremely prevalent in the elderly. Perhaps 30 to 40 percent are significantly symptomatic from their diseases.[19] Pain, muscular weakness, and limitation of joint function may limit functional independence. While treatment with nonsteroidal antiinflammatory drugs and physical therapy may restore the patient to his/her former functional status, this modest accomplishment during an acute flare-up of disease activity may permit an elderly person to manage his or her needs. Rehabilitation can relieve pain, restore function, and improve independence. Avoidance of the wheelchair is important because these patients often exhibit reduced upper body strength.. Ambulation can be preserved with protective devices and splints. Uninvolved parts of the body may be exploited to substitute for disabled limbs.

The goals of treatment should be to maintain and improve joint range of motion and to relieve pain. The patient also is assessed for the need of assistive devices for ambulation and performance of ADLs and IADLs. Treatments that may be helpful are heat (ultrasound, paraffin baths), exercise, and Transcutaneous Electrical Nerve Stimulation (TENS, see below).

Patients with severe arthritis tend to become psychologically dependent, which may affect motivation for rehabilitation. The multidisciplinary team assessment and rehabilitation environment do much to encourage motivation and independence. Elderly patients with rheumatoid arthritis are just as responsive to rehabilitation as are younger patients.[20]

Hip Fractures and Arthroplasty Joint replacement surgery is becoming increasingly common. In 1982, some 75,000 total hip replacements[21] and 40,000 knee replacements[22] were performed in the United States. It is estimated that one in three elderly women and one in six elderly men will ultimately experience hip fracture.[23] Surgical treatment is valuable in patients who will benefit from early mobilization. In order to benefit not only must older patients be fit enough for the operation itself, but also they must be fit enough to undergo the rigorous rehabilitation necessary after the operation. Early weight bearing does not seem to increase the risk of complications, while prolonged nonweight bearing often is associated with increased morbidity in the elderly.[24] Most orthopedists now favor prosthetic hip replacement for fractured hips, especially in elderly debilitated patients, since they can be mobilized almost immediately postoperatively. It may take 6 to 12 weeks before the patient returns to his or her previous level of function.

Amputation The rehabilitation potential of the elderly amputee is most often limited by the associated high incidence of cardiovascular disease, the compromised blood supply to the "good" limb, psychological adjustment to loss of limb, motivation and other medical complications in the early postoperative period.[25] Congestive heart failure and severe coronary artery disease may prevent the use of a prosthesis, as the energy necessary for amputees to ambulate with prostheses increases drastically relative to the able-bodied (a 40 percent increase with a below-knee amputation and a 90 percent increase in a patient with an above-knee amputation).[26]

Rehabilitation can be enhanced greatly by preoperative counseling, balance training, early postoperative mobilization, and prevention of contractures and pressure sores. Appropriately evaluated and motivated elderly can do quite well and often regain independence.

Parkinsonism After stroke and dementia, Parkinson's disease is the third most common disabling neurological disease in the elderly.[27] Even moderately afflicted individuals will benefit from therapy to improve weakness, range of motion, faulty posture, and coordination. Since fear of falling is especially common, directing patients to walk with their hands clasped behind their backs or asking them to take longer strides may help, but often a wheeled walker is necessary.[28] This assistive device should be spring loaded so that the patient can stop by putting pressure on the rear wheels. Thus a patient is helped with forward motion without the added motion of picking up the walker each time. The typical low-volume speech, usually delivered in a monotonous tone, can be aided with speech therapy.[29]

Physical Treatments

Although often relied on in the past to the near exclusion of therapeutic exercise, physical agents such as heat, cooling, or TENS therapy may be helpful in many circumstances, as noted above. However, a few caveats about their use in the elderly apply.

Deep or prolonged application of heat should be avoided in elderly patients with impaired circulation, because an intact blood supply is necessary to carry heat away and avoid a burn. Microwave or shortwave diathermy must be used with caution in patients with cognitive impairment, as there is no objective way of measuring how much energy is delivered to tissues by these modalities.[30] Prolonged application of heat may overload an elderly patient's cardiovascular or pulmonary systems. Nonetheless, local heating may be useful for pain relief, to improve blood flow, and to accelerate a suppurative process. Moist heat (hydrocollator packs, hot towels) is preferable to dry heat provided by electric pad.

Cooling is helpful in reducing swelling, especially if it is inflammatory in nature, in producing analgesia, and may reduce spasticity. The only contraindications to cooling are hypersensitivity to cold, Raynaud's phenomenon, previous frostbite, cryoglobulinemia, and paroxysmal cold hemoglobinuria.[1]

TENS also can be useful for pain control, especially when combined with other therapies.[31] Patients with neurogenic pain, cancer pain, arthritis, and musculoskeletal pain syndromes have found partial to nearly complete relief with TENS, though there is a tendency for this relief to wane with time.

Assistive Devices

While comprehensive review of assistive devices and adaptive equipment is beyond the scope of this article, a brief listing may familiarize the provider with some basic and practical information.[32]

Canes are prescribed for those patients with minimal ait impairment and are probably the most commonly used ambulatory aid. However, patients often use canes incorrectly. The cane should always be placed in the hand contralateral to the affected lower extremity. This allows partial weight bearing relief, as the cane is in contact with the ground at the same time as the affected limb. The length of the cane should be checked to ensure comfort and efficiency. The cane is of a proper length when the elbow is flexed about 30 degrees with the cane tip 6 inches lateral to the forefoot. Canes may be used by patients who no longer need crutches because of improvement in strength and stability (for example, a patient recovering from hip arthroplasty). Four-footed canes (quadripod or "quad" canes often are useful in patients ecovering from strokes.

Walkers are helpful for those patients with moderate to marked instability, such as often occurs after a stroke. Attachments for the forearm may help patients with rheumatoid arthritis. Hemiwalkers are often used in stroke patients who cannot use the upper extremity on the affected side.

Crutches provide more complete relief of weight bearing than walkers (if used as a pair). Their use may be limited in the elderly by reduced upper-arm strength in some individuals and by limited sense of balance. Again, proper fitting is important. The elbow should be flexed at 30 degrees when the hand is on the grip, and there should be enough room between the top of the crutch and the axilla for two fingers. In addition to providing relief from weight bearing, crutches may be useful for patients with mild ataxia or neuromuscular weakness.

Assistive devices are not limited to ambulatory aids. Adaptive equipment has been developed to help the disabled to dress, eat, maintain personal hygiene, perform household chores, and enjoy sports. Long-handled shoe horns are an example of a simple device that may help a patient who has difficulty with flexion of the trunk or lower extremities.[1] Bathroom modifications such as a raised toilet seat, grab bar and shower chair will help ensure the safety and independence of an elderly stroke patient. A rocker knife with its sharp curved blade can help a hemiplegic or amputee patient cut food with only one hand, because the food is simultaneously cut and held in place by the knife's rocking motion. Occupational and physical therapists are invaluable resources for both patients and physicians for suggestions regarding adaptive equipment and ambulatory aids.

Conclusion

Rehabilitation can restore function and reduce dependence in the elderly. Efforts should start as soon as possible after the precipitating event, with emphasis on what the patient can do not on the disease. Because of the multiplicity of problems often present in the elderly, a team approach is very helpful. Comprehensive assessment, while not necessary in every case, can help the older patient with a multitude of problems to get the most from therapy. Age alone is never a contraindication to efforts at rehabilitation.

Planning for Medical Decision Making: Living Wills and Durable Powers of Attorney

DIANE E. HOFFMAN JD, MS

The enactment of living will and durable power of attorney statutes in most states, including Maryland, provide individuals with a mechanism for setting forth their preferences for medical treatment in the event of their inability to make treatment decisions on their own behalf. Although still under used, these mechanisms are becoming more common, and physicians will be confronting them more frequently. The following overview of the Maryland Life Sustaining Procedures Act and the Durable Power of Attorney Act and discussion of their advantges and limitations is from the perspective of patients and their physicians.

At age 77, John Adams, a widower, was in a serious car ccident. His spinal cord was injured leaving him paralyzed from the neck down. He also suffered a head injury that left him unable to speak. Although he could hear and move his head, he did not appear to comprehend the questions posed to him and often did not recognize his friends or relatives. Unabe to care for himself, John was placed in a nursing home. Not long after he arrived at the home, John refused to accept food and seemed to have difficulty swallowing. The nursing home physician diagnosed John as having throat cancer. The physician told John's son, Mike, that there was a 60 percent chance he could successfully remove the cancerous tumor with surgery. Without the surgery the physician predicted John could live for six months, with the surgery his life would be extended two or three years. As the closest surviving relative, Mike was asked if he would consent to the operation. Mike was torn. He hated seeing his father this way, but he had no idea what his father would have wanted done under these circumstances.

This problem could have been avoided if John had set forth his wishes, in advance, regarding the type of medical intervention he would have wanted in such a situation. While many people make plans to protect their relatives financially in the case of their disability or death by purchasing insurance and preparing a will, few plan for the possibility of incompetence or inability to make medical decisions because of mental impairment or loss of consciousness.[1] Physicians can assist their patients in this type of planning by becoming familiar with the types of "advanced directives" now available for health care decision making and by asking their patients if they have made any provision for making medical decisions should they become incompetent.

This type of planning is important for at least three reasons. First, it ensures that the patient's own desires will be followed if and when the patient becomes incompetent. Second, it provides assistance to a patient's family members who are often left with the emotionally charged decisions regarding a loved one's health care. Third, it provides guidance to health care professionals who otherwise may be unsure if a particular course of treatment is what the patient would have wanted under the circumstances.

Until fairly recently, there was no assurance that even if one did specify guidelines for health care decision making in the event of incapacity that those guidelines would be followed. Physicians, uncertain of their own liability, were apprehensive about following such guidelines. Now, however, many states have adopted legislation that either immunizes health care providers from liability for complying with such guidelines or alternatively mandates that they follow such guidelines or face criminal or civil penalties.

This legislation includes two mechanisms for specifying advanced directives: the living will and the durable power of attorney. This article will discuss both of these mechanisms with a particular focus on Maryland law.

Living Wills

In general, a living will is a legally executed document that sets forth an individual's wishes not to receive "life prolonging" medical treatment in the event that the individual becomes incompetent to make treatment decisions on his or her own behalf and the individual has a "terminal condition."[2] Thirty-eight states and the District of Columbia now have "living will" statutes, or, as they are alternatively called, Natural Death Acts or Life Sustaining Procedures Acts. [1]

The Maryland Life Sustaining Procedures Act,[3] first enacted in 1985, is somewhat unique. It not only allows a legally competent individual to execute a declaration directing the withholding or withdrawal of life-sustaining procedures but also allows an individual to execute a declaration authorizing the initiation or continuation of such procedures. [2]

In Maryland, as in most states, any individual qualified to make a will may execute a living will, that is, the individual must be at least 18 years old and competent. The declaration must be voluntarily made. Furthermore, it must be written and signed by the person making it or by another in the presence and at the direction of the declarant. The signing must be attested to by at least two adult witnesses not closely related to

The author is an Assistant Professor, University of Maryland School of Law, Baltimore.

the declarant by blood or marriage. To avoid conflicts of interest, a witness may not have any financial interest in the declarant or be responsible for the declarant's medical care or an employee of someone responsible for his/her medical care.

For the will to be effective, if the will is to request the withholding or withdrawal of treatment, the language of the document must be substantially similar to the language provided in the statutory form (see below). Furthermore, the declarant must provide a copy of the document to his or her attending physician. The physician, upon receipt, must place the document in the patient's medical records.

These are the necessary prerequisites for a valid living will. The document does not become effective, however, until the declarant becomes incapable of making medical decisions on his/her own behalf and two physicians who have personally examined the patient (one of whom is the patient's attending physician) certify the patient has a "terminal condition" and death is "imminent and will occur whether or not life-sustaining procedures are utilized."

Unless the attending physician knows or has a reasonable basis for believing that the declaration has been revoked, the physician is then responsible for im plementing the declaration. If, for some reason, the attending physician is unable to comply with the patient's requests as specified in the living will, the physician must make reasonable efforts to transfer the patient to another physician who will carry out the patient's wishes.

Under the Maryland statute, physicians who take actions based on a patient's living will must include a statement in the patient's medical record setting forth the basis for their belief that the patient had a valid and unrevoked living will. A copy of the will with a statement that the physician was not informed of any revocation would be sufficient. Likewise, physicians who fail to comply with a patient's living will because of knowledge or a belief that the will has been revoked must provide the basis for this knowledge or belief in the patient's chart. Although not specifically required by the statute, physicians who are unable to carry out the directions set forth in a living will because of ethical or other reasons should document their efforts to transfer the patient in the patient's medical record.

Physicians who in good faith comply with the directions of a patient as set forth in the patient's living will will not be civilly or criminally liable or subject to professional discipline for their actions. Physicians may, however, be

Statutory Form for a Living Will

DECLARATION

If at any time I should have an incurable injury, disease, or illness certified to be a terminal condition by two (2) physicians who have personally examined me, one (1) of whom shall be my attending physician, and the physicians have determined that my death is imminent and will occur whether or not life-sustaining procedures are utilized and where the application of such procedures would serve only to artificially prolong the dying process, I direct that such procedures be withheld or withdrawn, and that I be permitted to die naturally with only the administration of medication, the administration of food and water,* and the performance of any medical procedure that is necessary to provide comfort care or alleviate pain. In the absence of my ability to give directions regarding the use of such life-sustaining procedures, it is my intention that this declaration shall be honored by my family and physician(s) as the final expression of my right to control my medical care and treatment.

Declaration made this_____day of_____(month, year), I, _____, being of sound mind, willfully and voluntarily direct that my dying shall not be artificially prolonged under the circumstances set forth in this declaration.

I am legally competent to make this declaration, and I understand its full import.

Signed_____
Address_____

Under penalty of perjury, we state that this declaration was signed by_____in the presence of the undersigned who, at_____request, in presence, and in the presence of each other, have hereunto signed our names and witnessed this_____day_____of 19____ and declare: The declarant is personally known to me, and I believe the declarant to be of sound mind. I did not sign the declarant's signature to this declaration. Based upon information and belief, I am not related to the declarant by blood or marriage, a creditor of the declarant, entitled to any portion of the estate of the declarant under any existing testamentary instrument of the declarant, financially or otherwise responsible for the declarant's medical care, or an employee of any such person or institution.

_____Address_____
_____
_____Address_____
_____

*Although not part of this statutory form, if desired the following language may be added: *Notwithstanding the above statement, I direct that my life not be prolonged by the artificial administration of food and water.*

liable if they know of the existence of a living will and fail to comply with its directions or fail to make reasonable efforts to transfer the patient to another physician who will comply with the declaration.

Although the living will is a useful mechanism for patients to make clear their desires for medical treatment should they become incompetent and terminally ill, the mechanism as provided for in Maryland, has several shortcomings of which physicians should be aware. First, the statute is limited to patients who have a terminal condition and whose death is imminent. Although "imminent" is not defined by the statute, under a strict interpretation of the language, the statute would only apply to individuals whose death will occur in a relatively short time. Thus, the statute would not apply to patients in a persistent vegetative state or to elderly patients with numerous debilitating and chronic diseases who may live for years.

A second major limitation of the statute is its ambiguity regarding the withholding or withdrawal of food and water needed for patient comfort. Although the statutory form appears to prohibit the withholding or withdrawal of such sustenance, a separate section of the Act provides that the provisions of the Living Will law are "cumulative and may not be construed to impair or supercede any legal right or responsibility that any person may have to effect the initiation, continuation, withholding, or withdrawal of life sustaining treatment." [4] Based on the premise that a person has a constitutional right to refuse to consent to the insertion or continued presence of a feeding tube, in a recent opinion[4] the Maryland Attorney General has interpreted the law to provide that if a person so chooses, "he or she may incorporate in a living will an express, specific directive that artificially administered sustenance is not to be used when the person is terminally ill." Alternatively, if a person simply completes the statutory form, and makes no amendments to it, the opinion states "that person's living will is **not** sufficient to direct the withholding of artificially administered sustenance."

The result of this interpretation is consistent with the view of the Council on Ethical and Judicial Affairs of the American Medical Association. The Council has taken the position that life-prolonging medical treatment includes nutrition and hydration and may be withdrawn or withheld from a patient in an irreversible coma if the burden of such treatment outweighs the benefits.[1,5] Similarly, a recent AMA poll indicates that 78 percent of physicians favor the withdrawing of food or water from hopelessly ill or irreversibly comatose patients if they or their family request it.[6]

A third problem with the statute is that it does not specify under what circumstances a physician may refuse to comply with a living will and therefore transfer the patient. Nor does the statute specify what constitutes "reasonable efforts" to transfer or what the physician must do if he/she has attempted to transfer the patient but is unable to do so.

Durable Powers of Attorney

In light of the limitations on the use of the living will in Maryland, patients may want to consider the more flexible durable power of attorney. The Durable Power of Attorney (DPA) is a fairly recent innovation on the centuries-old legal instrument, the Power of Attorney. The Power of Attorney is simply a written authorization for someone to act as the agent of a principal for whatever purposes the principal sets forth in the writing.[7] The principal must be competent when he/she drafts the power of attorney and the power terminates when he/she becomes incompetent. In contrast, the DPA endures or begins when the principal becomes incompetent.

Although the DPA has been used most often for financial and property management, it is increasingly being used for medical decision making. All 50 states and the District of Columbia have enacted durable power of attorney legislation,[5,7] and at least eleven states have enacted durable power of attorney statutes that explicitly allow for medical decision making.

Although the Maryland DPA statute[8] is silent with regard to medical decision making, the Maryland Attorney General has interpreted the law to apply to decisions concerning medical treatment.[4]

To create a DPA in Maryland, an individual need only appoint an agent, set forth in writing what decisions the agent is authorized to make on the principal's behalf, and include in the writing the following or similar language:

> 1. This power of attorney shall not be affected by the disability of the principal, or
> 2. This power of attorney becomes effective upon the disability of the principal.[8]

In appointing an agent, individuals should avoid anyone with a possible conflict of interest. For this reason, physicians and other health care providers should not agree to serve as agents for their patients. Also, patients should be advised to specify more than one agent, in case of the death or incapacity of the agent initially selected.

There are no formal requirements for executing the DPA in Maryland, that is, the document need not be witnessed or notarized. However, because statutes in other states may require witnesses or notarization, these formalities are recommended so that the document would be valid outside of Maryland. Also, witnesses are

recommended so that they can testify as to the competence of the principal at the time of executing the power if it is ever questioned.

Thus, the Maryland DPA is a relatively simple document to execute and has a great deal of flexibility as an advanced planning tool for medical decision making. Individuals who want to insure that their medical treatment preferences are followed, however, must provide explicit instructions to their agents and may want legal and medical assistance in drafting a document that is likely to be honored by third parties.

Although the Maryland DPA statute does not explicitly provide health care providers with immunity from liability for complying with a patient's wishes as expressed by the patient's agent or proxy, physicians who comply with a DPA should be relatively insulated from liability. No health care provider to date has been held liable for treating a patient in accordance with a written directive signed by the patient. To the contrary, given the recent trend in the courts to recognize patient autonomy in these matters, physicians who knowingly take actions that are at odds with an explicit directive of the patient may be successfully sued for negligence or battery.[1]

If a physician is presented with a DPA by a patient prior to the patient's incapacity, the physician should discuss the document with the patient. Physicians who are willing to comply with the directive should include a copy of the document in the patient's medical record. Physicians who are uncomfortable with the directive should inform the patient so he or she has an opportunity to look for another physician or health care provider who will comply with the directive. Alternatively, if a physician is confronted with someone who claims to be an agent for the principal acting under the provisions of a DPA, the physician should request a copy of the DPA and place it in the patient's chart. Although not required by statute, if at that point, the physician determines that he/she could not comply with the agent's requests, the physician should attempt to transfer the patient to another physician who would comply.

In drafting a usable and effective DPA, principals may want to include language specifying when the power will go into effect. The general language that the power will be effective on the disability of the principal leaves much to be desired. A more useful directive would be one stating that the power will become effective when one or two physicians or psychiatrists, certify that the principal is no longer capable of making informed medical treatment decisions on his/her own behalf.

In addition, a principal should be explicit about the medical treatment decisions he or she wants to authorize. A decision based on a blanket authority to an agent to make all treatment decisions on behalf of the principal without specific guidance from the principal may not be valid if challenged. The decision made by the agent is much more likely to be upheld if it is one that the principal would have made or agreed with. Specific authorizations a principal may want to consider include the following:

- access to all medical records
- ability to employ or discharge medical providers or authorize admission to medical facilities
- ability to grant releases of liability to medical providers
- ability to make anatomical gifts
- ability to consent to measures for relief of pain
- specific wishes to initiate, continue, withhold or discontinue treatment, food and fluids or life-sustaining procedures under specified conditions[7]

The "open-endedness" of the DPA in Maryland offers individuals a great deal more flexibility than does the living will mechanism in drafting directives that closely fit the individual's preferences. The lack of statutory guidance, however, can result in questions about an individual's preferences. As a result, some state statutes provide sample language, such as the following, to assist principals articulate their preferences:

> If I suffer a condition from which there is no reasonable prospect of regaining my ability to think and act for myself, I want care directed to my comfort and dignity and I also want artificial nutrition and hydration if needed, but authorize my agent to decline all other treatment, the primary purpose of which is to prolong my life.[9]

These directives are a step in the right direction but leave much room for interpretation. The medical profession can assist patients be more specific in their directives by providing them with certain scenarios regarding terminal illnesses and medical interventions they might want to consider addressing. The more explicit the directive the easier it will be for family members and health care providers to decide how to treat a patient when he or she is unable to speak for himself or herself.

Conclusion

Recent legislation in Maryland and most other states now provides two statutory mechanisms for individuals to exercise their fundamental right to make their own health care decisions after they become incompetent: the living will and the durable power of attorney. Although these legislative initiatives are extremely important, they are but a first step in an area of law that is still

UROLOGIST Private Practice Opportunity

Excellent opportunity for a Board Eligible / Board Certified urologist to join a busy private group practice in the mid-Atlantic region. The practice serves a growing community supported by a 500+ bed tertiary care hospital. The contemporary office setting, located just five minutes from the hospital, is part of a newly built Medical Center and provides a supportive medical and administrative staff. Salary plus percentage compensation arrangement. Send CV to Box 292, 370 Morris Ave., Trenton, NJ 08611.

evolving. So far, no Maryland courts have decided any cases under the state's Life Sustaining Procedures or Durable Power of Attorney Acts. Thus, several questions about the application and interpretation of the Acts remain unanswered. Despite these uncertainties, there is a trend nationwide to support and encourage the use of these advanced directives. Physicians can increase their use by educating themselves and informing their patients about them.

Featuring a variety of physician speakers and topics and hosted by John Stupak, the programs will consist of a short discussion of the topic followed by call-in questions from listeners.

For a list of scheduled topics and speakers contact the Faculty Office, at 539-0872.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

Ninth Annual Med Chi Photo Contest

Enter Early -- Deadline For Entries: March 15,1989
Two Categories: Black & White Or Color
Open to Med Chi Members and Auxiliary Members
All Photographs on Display at the
Turf Valley Country Club
During the 1989 Annual Meeting
First and Second Prizes Awarded in Each Category

Eligibility

All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

Contest Rules

1. Photographs may be submitted in two categories-- Black and White or Color.

2. Limit: three entries per person

3. Entries must have name address, and telephone number attached to the back of each photograph.

4. Prints only, no smaller than 8x10 or larger than 11x14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.

5. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on March 15, 1989.

6. Entries must be matted or dry mounted. No framed photographs will be accepted.

7. Photographs entered in the contest will be on display at the Annual Meeting in April of 1989.

8. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 12 thru 14, 1989.

9. Photographs will NOT be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting on Friday, April 14, at noon or at the Faculty Building thereafter.

10. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

11. Prizes will be awarded to the FIRST AND SECOND place winners. Additional information about the prizes will be published in the Journal.

Board of Physician Quality Assurance Actions

In the Matter of
John J. Shigo MD
Before the
Maryland State Board of
Physician Quality Assurance

Findings of Fact,
Conclusions of Law, and Recommendation

Based on information received regarding the recent hospitalization of John J. Shigo MD (the Respondent), the Commission on Medical Discipline[1] (the Commission) ordered that the Respondent's license to practice medicine in the State of Maryland be summarily suspended. This order of June 21, 1988 further required the surrender of certain documents certifying the Respondent's entitlement to practice medicine in Maryland. He was also directed to submit to a psychiatric evaluation conducted by Jonas R. Rappeport MD. Finally, the Commission ordered that a hearing be held within thirty (30) days of the date on which the Commission received a written request for such a hearing from the Respondent. The Respondent's request for a hearing was received on July 1, 1988, and a hearing was held on July 14, 1988.

By letter dated August 25, 1988, Respondent's attorney was forwarded a copy of the Hearing Officer's proposed Findings of Fact, Conclusions of Law, and Recommendation (proposed order). Respondent chose not to except from the Hearing Officer's proposed order. On Wednesday, October 12, 1988, the Board of Physician Quality Assurance (the Board) considered the entire record and the Hearing Officer's proposed decision. By a unanimous vote of the Board members considering this case, the Board makes the following Findings of Fact, Conclusions of Law, and Order.[2]

Findings of Fact

1. Prior to June 21, 1988, the Respondent was engaged in the practice of medicine in the State of Maryland.
2. In March 1986, the Respondent's parents were found dead in their home as a result of accidental asphyxiation.
3. Since graduating from medical school in 1969, the Respondent has been married and divorced twice, the latest in 1987.
4. In 1985, following the Respondent's separation from his second wife, considerable and costly litigation ensued regarding a settlement agreement, child support and related matters.
5. In or about April 1987, the Respondent sought relief from the stress and pressures of domestic strife and litigation by giving up his medical practice of 16 years and moving to Bermuda for approximately two (2) months.
6. In or about July 1987, the Respondent returned to the Washington Metropolitan area and retook the family practice specialty medical board examinations.
7. After taking his specialty board examinations, the Respondent attended a medical meeting in India with his girlfriend.
8. The Respondent extended his stay in India to avoid the stress of litigation and further argument surrounding his divorce.
9. In September 1987, the Respondent returned to the United States and attended a California meeting of the American Academy of Family Practice.
10. In October 1987, the Respondent visited his daughter in Charleston, South Carolina.
11. While in Charleston, the Respondent was arrested on a fugitive warrant issued in Maryland because the child support arrearage.
12. Upon his return to Maryland, the Respondent was incarcerated for ten (10) days.
13. When released, the Respondent lived in an apartment constructed in a house jointly owned with Mr. J. P. Rickett CPA, Respondent's accountant.
14. Mr. Rickett and the Respondent had a business association with regard to the Respondent's medical practice in Bowie, Maryland.
15. The Respondent gave Mr. Rickett his general power of attorney under which Mr. Rickett had arranged for other physicians to manage the Respondent's medical practice in Bowie while he was away from the Washington Metropolitan area.
16. The Respondent did not return to his medical practice in Bowie because it appeared that some patients believed he had deserted them.
17. The Respondent then worked as a physician for Kaiser Permanente in Kensington, Maryland, but left the position after one (1) month because he believed there was inadequate staff support.
18. At that point, the Respondent felt anxious and depressed for a number of reasons. In addition to the recency of his parents' deaths, he had to go back to court for the final settlement of his divorce, he was in arrears on child support, he had given up a 16-year medical practice in Bowie, he did not want to go into court without a job, Mr. Rickett indicated he was "washed up" in Bowie and wanted him to take over a practice in Accoceek, and the Internal Revenue Service was investigating the withdrawal of funds from his pension plan.[3]

1. The Commission on Medical Discipline was the disciplinary authority for physicians in the State of Maryland prior to July 1, 1988. As of that date, the Board of Physician Quality Assurance assumed the powers and duties previously held by the Commission on Medical Discipline and the State Board of Medical Examiners.

2. Prior to the Board's considering the record, Respondent, through his attorney, agreed to be examined by Jonas R. Rappeport MD, and have the Board's Chair, Israel H. Weiner MD, report to the Board orally regarding Dr. Rappeport's finding. The Board considered this information.

3. The Respondent alleged that his former wife "embezzled" about $150,000 from his pension plan and that he had been providing her with $3,850 a month for support.

On instruction of the Council of the Medical and Chirurgical Faculty of the State of Maryland, "Findings of Fact, Conclusions of Law, and Order" will be published in the Maryland Medical Journal.

19. On or about January 21, 1988, at around 6:00 p.m., the Respondent was found unconscious in his home at 11800 Galaxy lane, Bowie, Maryland, by a friend. Four (4) syringes were found next to the Respondent.

20. The Respondent had attempted suicide by injecting significant quantities of Tramxene, Phenergan, and Demerol IV into his body.

21. On or about January 2 was transported via medic unit to Prince George's Hospital. Throughout the transport and upon his admittance to the Hospital's Emergency Room at approximately 10:17 p.m., the Respondent remained comatose, exhibited pinpoint pupils bilaterally, and was unresponsive to deep pain stimuli.

22. In connection with the Respondent's admission to Prince George's Hospital on or about January 21, 1988, a drug screen was performed from samples of his blood and urine. The drug screen was positive for benzodiazepines and opiates.

23. A physical examination of the Respondent upon admission to the hospital on or about January 21, 1988, revealed fresh multiple needle marks on bilateral antecubital fossae with related ecchymosis.

24. Upon Respondent's admission to Prince George's Hospital, his medical diagnosis was "drug overdose."

25. The Respondent remained a patient in Prince George's Hospital until his transfer to the Sheppard Pratt Hospital (hereinafter Sheppard Pratt) on January 26, 1988.

26. Sheppard Pratt is a private psychiatric hospital located in the State of Maryland.

27. At the time of the Respondent's transfer to Sheppard Pratt on January 26, 1988, the Patient Transfer Form listed his diagnoses as an overdose with opiates and benzodiazepines as well as an adjustment disorder with mixed reaction.

28. Upon the Respondent's transfer to Sheppard Pratt, Dr. Carl H. Keller, a Psychiatrist on staff at Prince George's Hospital, prepared a Discharge Summary. The Summary reveals that the Respondent "denied making a suicide attempt or that he wanted to die" and listed diagnosis of adjustment disorder and depressed mood.

29. While at Sheppard Pratt, Dr. Joseph Chambers of Physicians Rehabilitation contacted the Respondent and arranged for his therapy with Dr. Harvey Fernbach.

30. Upon release from Sheppard Pratt, the Respondent began treatment with Dr. Fernbach and also tried to open his own practice in Bowie.

31. Conflicts arose between the Respondent's girlfriend, who was acting as the office manager of the new practice, and Mr. Rickett. This conflict created more stress and anxiety for the Respondent.

32. In the interim, the local medical society required the Respondent to see Dr. Richard Anderson, a Baltimore psychiatrist.

33. Dr. Anderson opined that the Respondent's problems related to his relationship with and dependency on Mr. Rickett.

34. Thus, several major stressors were acting on the Respondent at that point: namely, his dependency on Mr. Rickett, who still had control of the Respondent's money; the slowness of the buildup of his medical practice; the conflict between his girlfriend and Mr. Rickett; and the girlfriend's threat to leave if the Respondent did not cut his ties with Mr. Rickett. The Respondent felt he was unable to get everything under control.

35. On or about May 10, 1988, the Respondent went into the garage of a friend he was staying with, started the car, put a blanket on the ground, took twenty-five (25) 25 mg Phenergan capsules and four(4) 15 mg Restoril tablets, ran around to quicken absorption of the medicine and then lay down next to the engine exhaust pipe. He started to choke, ran out of the garage and fell down on the lawn where his daughter found him.

36. On May 30, 1988, the Respondent was transported via medic unit from his friend's residence at 7000 Highbridge Road, Bowie, Maryland, to the AMI Doctors' Hospital of Prince George's (hereinafter Doctors' Hospital).

37. On May 30, 1988, at approximately 3:15 a.m. when admitted to Doctors' Hospital, the Respondent was comatose.

38. Upon the Respondent's admission through the emergency room of Doctors' Hospital, it was revealed that the Respondent was previously seen by a psychiatrist and experienced a prior drug overdose.

39. The Admission Note prepared at the time of the Respondent's admission to Doctors' Hospital listed the reasons for admission as an overdose of benzodiazepine and carbon monoxide poisoning.

40. The presence of benzodiazepine was noted in samples of the Respondent's blood and urine collected at the time of his admission on May 30, 1988.

41. When the Respondent was transferred to a private room at Doctors' Hospital on June 3, 1988, the physicians' orders contained instructions for a 24-hour sitter with the patient, either hospital or agency personnel.

42. Physicians' orders for the Respondent's care dated June 4, 1988, contained instructions to continue the 24-hour sitter and suicidal precautions.

43. During his hospitalization, the Respondent was referred to Dr. Gustave Weiland, a Board Certified Psychiatrist, who began Psychotherapy and continues to see the Respondent twice a week.

44. On or about June 21, 1988, the then-Commission on Medical Discipline, summarily suspended the Respondent's license to practice medicine in the State of Maryland, ordered that a hearing be held to consider the emergency suspension, and directed the Respondent to appear for a psychiatric evaluation by Jonas R. Rappeport MD. (See Commission's Order dated 21 June 1988).

45. The Respondent was interviewed and evaluated by Jonas R. Rappeport MD on July 11, 1988.

46. Dr. Rappeport stated that the Respondent suffers from a bi-polar disorder with two clear depressive episodes and possible hypomanic episodes. Dr. Rappeport also found that at the time, there was sufficient hypomania and evidence of poor judgment to cause him to believe the Respondent should not practice medicine at that time.

47. Dr. Rappeport stated that suspension of the Respondent's license on an emergency basis was appropriate and the justifying conditions continue to exist.

48. Dr. Rappeport expressed his professional opinion that the Respondent's license not be returned to him immediately, that he undergo a period of continued treatment, that he attempt to stabilize his life situation and finances before his license is returned, that when the Respondent returns to practice he should practice under the supervision of, or in relationship to, other physicians, not as a solo practitioner.

49. Dr. Rappeport stated further that the Respondent must remain under psychiatric care and take appropriate medications for at least another year, if not longer.

50. Finally, Dr. Rappeport testified that suspension of the Respondent's license could be removed in thirty(30) to sixty (60) days from July 14, 1988, provided the Respondent's other life situations or stressors have been appropriately reduced or eliminated.

51. The Respondent, via counsel, testified that the litigation surrounding his divorce settlement and child support has been finalized.

52. The Respondent has removed himself from the prior stressful living situation, had moved to another locale, and has broken his relationship with Mr. Rickett.

53. The Respondent has rented and moved into a townhouse in Georgetown and continues with psychiatric care including group therapy.

54. In this letter of June 28, 1988, Dr. Weiland stated that in his professional Judgment, the Respondent is well and able to practice medicine without any limitations.

55. On October 11, 1988, Dr. Rappeport examined Respondent and opined that Respondent could return to practice in a group setting if Respondent continues in the therapeutic relationship with Dr. Weiland.

Conclusions of Law

State Government Article 10-405(b), Annotated Code of Maryland, provides in pertinent part that a unit [of the State Government] may order summarily the suspension of a license if the unit:

> (1) finds that the public health, safety or welfare imperatively requires emergency action; and
> (2) promptly give the licensee:
> (i) written notice of the suspension, the findings, and the reasons that support the findings; and

When your patients need your best health care recommendations use your head.

Remember this hat.

When your patients need home health care remember to recommend Staff Builders. Our nurses (RN/LPN), therapists (physical/occupational/speech), medical social workers, nurses aides, home health/personal care aides, home-makers, live-in home companions are all carefully screened, bonded, insured and professional in every way. But more than that, they care. So remember Staff Builders when you recommend health care services. And remember most home health services are paid by Medicare, Medical Assistance, or Blue Cross. And that hospital and home private duty services are also available. Staff Builders personal and professional care is as close as your phone. Just give us a call if we can be of assistance.

(ii) an opportunity to be heard.

Based on the above findings of fact, it is concluded that the public health, safety, and welfare required that Respondent's license be summarily suspended.

Order

Based on the Findings of Fact and Conclusions of Law, it is hereby ORDERED this 24th day of October 1988, that the Summary Suspension of Respondent's license to practice medicine is hereby STAYED, subject to Respondent's compliance with the following conditions:

1. Respondent shall remain in psychiatric care and comply with all recommendations of his therapist;
2. Respondent shall only practice medicine in conjunction with other licensed physicians in a practice setting approved by the Board;
3. The Respondent shall arrange for Respondent's therapist to submit written monthly reports to a representative of the Board[4] commencing one month after the date of this Order, indicating that Respondent is making satisfactory progress in dealing with the problems that led to his license being summarily suspended, the number of times a month Respondent is in therapy, any medications being taken, and whether Respondent is complying with all medical recommendations of the therapist;
4. The Respondent shall continue in therapy until the therapist certifies to the Board's representative in writing that the Respondent is discharged;
5. In the event that the Respondent terminates therapy prior to discharge by the Respondent's therapist, the therapist shall immediately notify the Board's representative that Respondent has left therapy without consent of the therapist;
6. The Board's representative shall prepare for Dr. Rappeport (or a Board approved psychiatrist) to review a summary of the therapist's reports (attaching the reports thereto) when Respondent petitions the Board for reinstatement of his license.
7. In the event that the therapist's reports indicate that Respondent is not complying with the therapist's recommendations, that Respondent has terminated therapy against the advice of his therapist, or that Respondent is a danger to himself or the public health, safety or welfare, the Board's representative will report IMMEDIATELY to the Board;

4. The Board's representative shall be Lex B. Smith, MD, 827 Park Avenue, Baltimore, MD 21201 (301-752-8822). The Board's representative shall be forwarded the following information in order to carry out his responsibilities to the Board: (1) the original Order summarily suspending Respondent's license; (2) the hearing officer's proposed decision together with supporting documentation and transcript thereof; and (3) Dr. Rappeport's evaluations.

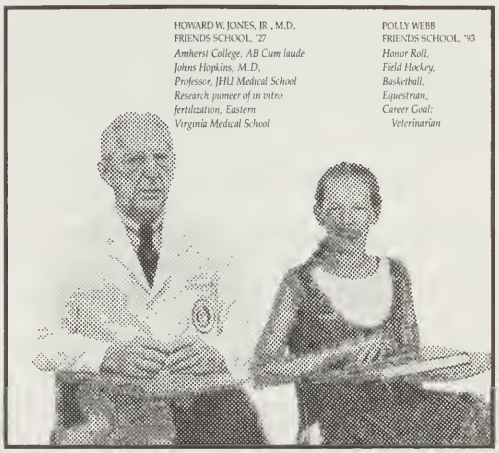
8. In the event that the Board's representative does not receive the required reports, due starting on November 30, 1988, and due thereafter on the 30th of the month, until a year has passed from Respondent's approved employment commencing, the Board's representative will notify the Board within five (5) days of failing to receive the report;

9. In the event that Respondent moves permanently or temporarily, Respondent shall promptly notify the Board of Physician Quality Assurance in writing of Respondent's new address and telephone number during the probationary period;

10. The Respondent shall practice in accordance with the laws and regulations governing the practice of medicine in Maryland; and be it further

ORDERED one (1) year from the date the Board approves Respondent's job description, Respondent may petition the Board to remove any conditions of his license to practice medicine in Maryland. Prior to any decision being made by the Board on said petition, Respondent shall submit to an examination by Jonas R. Rappeport MD or another psychiatrist approved by the Board. At that time, if the Board determines that a vacating of the suspension would not be appropriate, the Board may impose other conditions. If the Respondent has complied with all conditions, and if there is no outstanding complaint against Respondent's practice, the Board will reinstate the Respondent's license without any conditions or restrictions whatsoever; and be it further

ORDERED that Respondent's license to practice medicine and his federal and state permits to prescribe controlled dangerous substances and legend drugs are restored, subject to the above conditions; and be it further



ORDERED that if the Board receives a report from Respondent's therapist or the Board's representative indicating that Respondent is a danger to himself or to the public safety, health, or welfare, or if Respondent has terminated therapy against the advice of his therapist, the Board, **WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD MAY LIFT THE STAY OF SUMMARY SUSPENSION OR RESPONDENT'S LICENSE,** provided that Respondent is given immediate notice of the charges and an opportunity for a hearing thirty (30) days after requesting same; and be it further

ORDERED that if Respondent violates any other term of this Order, the Board, after notice and a hearing, and a determination of violation, may lift the stay of **SUMMARY SUSPENSION** of Respondent's license or may impose any other disciplinary sanctions it deems appropriate, and be it further

ORDERED that this is a final order.

In the Matter of
Jeffrey H. Schimandle, MD
Before the
Maryland State Board of
Physician Quality Assurance

Order for
Summary Suspension of
Registration to Practice Medicine

The Board of Physician Quality Assurance (the Board) herein sets forth the following background information as pertinent to the context in which the instant Order for Summary Suspension of Registration to Practice Medicine arises:

1. Based on certain information which came to its attention, the Commission on Medical Discipline of Maryland (now the Board of Physician Quality Assurance), pursuant to its authority under the State Government Article, 10-405(b), *Annotated Code of Maryland*, on June 21, 1988, summarily suspended Jeffrey H. Schimandle's MD (the Respondent) registration to practice medicine in Maryland.

2. On August 16, 1988, prior to any hearing or other disposition of the June 21, 1988 emergency order (the June 21 Order), the parties entered into a Consent Order which vacated the June 21 Order and reinstated Respondent's registration to practice medicine subject to certain conditions.

3. Two of the conditions Respondent was required to satisfy are set forth in Paragraphs 2 and 4 of the Consent Order as follows:

> 2. For a period of ninety (90) days beginning on the day that Respondent resumes work as a resident physician employed by the University of Maryland Hospital, Respondent shall not possess, dispense, use or provide to any person any controlled dangerous substances.
>
> 4. If a urine specimen tests positive as defined in the Protocol attached as Exhibit B or Respondent otherwise fails to comply with or violates any of the conditions upon his registration to provide requested urine specimens as set forth in paragraph 3 above and as more fully explained in the Protocol attached as Exhibit B, then the Board pursuant to its authority under State Government Article, 10-405(b), *Annotated Code of Maryland*, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD, may immediately reinstate the Emergency Order with amendments, if necessary, summarily suspending Respondent's registration to practice medicine provided that Respondent is given notice of this action and an opportunity to be heard within thirty (30) days after Respondent requests the hearing.

4. The Consent Order, executed by the Respondent on August 18, 1988, provided, among other things, for the Respondent to supply random supervised urine samples four times a week for a period of 90 days for the purported purpose of establishing that Respondent was not taking for personal use controlled dangerous substances. The urine specimens were to be obtained pursuant to procedures set forth in the "Protocol" which was a part of the Consent Order.

5. The June 21 Order was based upon reports over a period of several months by nursing staff at different hospitals indicating the irregular handling of Demerol, a controlled dangerous substance, by the Respondent. However, at the time of the June 21 Order, there existed no direct evidence through a urine specimen that Respondent was ingesting or injecting Demerol for his own use. The June 21 Order is incorporated by reference herein.

6. In accordance with the Consent Order, the Board subsequently attempted to effectuate the drug testing protocol. During the period August 23, through and including November 14, 1988, 20 urine specimens were obtained. Because of difficulties in contacting Dr. Schimandle, urine specimens were not obtained on 17 days in which attempts were made to obtain urine specimens.

7. The urine specimen obtained on November 8, 1988 tested positive for normeperidine, a metabolite of meperidine (a/k/a Demerol).

Findings of Fact

Based on the background information set forth above, the Affidavits attached as Exhibits hereto and all other information known and available, the Board has reason to believe the following facts are true:

1. Respondent is an unlicensed medical practitioner who is registered with the Board through the University of Maryland Medical System residency program. Respondent is a third-year resident in orthopedic surgery at the University of Maryland Medical System.

2. On November 8, 1988, at 4:40 p.m., while in the course of his duties as a third-year resident, Respondent provided a specimen (the Specimen) as required by the Consent Order.

3. The circumstances and conditions under which the Specimen was obtained are set forth in the Affidavit of Leroy Jones, which is incorporated by reference herein.

4. The Specimen was subsequently tested by the Maryland Medical Laboratory, Inc., the designed testing facility, pursuant to the Protocol set forth in the Consent Order.

5. The Specimen tested positive as defined in the Protocol. The specimen contained normeperidine, a metabolite of meperidine (a/k/a Demerol).

6. The testing procedures utilized and the results obtained are more fully set forth in the Affidavit of Daniel S. Isenschmid, and the laboratory report attached thereto. The Affidavit of Daniel S. Isenschmid is incorporated by reference herein.

7. The presence of normedperidine in the Specimen is evidence that Respondent possessed and used a controlled dangerous substance in violation of the Consent Order.

8. Respondent's possession and use of a controlled dangerous substance (Demerol) while on duty as a resident at the University of Maryland Medical System poses a risk to the health, safety, and welfare of the general public, and, in particular, to patients for whom Respondent is responsible.

Conclusion of Law

Based on the foregoing facts, the Board finds that the public health, safety, and welfare imperatively requires emergency action in this case, pursuant to State Government Article, 10-405(b), *Annotated Code of Maryland*.

Order

It is this 16th day of November 1988 by the Board of Physician Quality Assurance

ORDERED that pursuant to the authority vested in the Board by State Government Article, 10-405 of the *Annotated Code of Maryland*, Respondent's registration to practice medicine in the State of Maryland at the University of Maryland Medical System is hereby **SUMMARILY SUSPENDED**; and be it further

ORDERED that a hearing to consider this emergency suspension shall be held before a hearing examiner, pursuant to State Government Article, Administrative Procedure Act, 10-207 within thirty (30) days of the date on which the Board receives a written request for such a hearing from the Respondent; and be it further

ORDERED that this is a **FINAL ORDER**.

"We Do It With A Touch Of Class"

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

SO WE CAN HOLD THE PREMIUMS DOWN.

THE LOWER RESPIRATORY TRACT—
More vulnerable to infection in smokers and older adults

Experience counts

Ceclor® Pulvules® 250 mg
cefaclor
think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins
Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
- Gastrointestinal (mostly diarrhea): 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%, usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology
- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly).

THE SECRET IS OUT

"I joined the Southern Medical Association in 1980 initially because of the insurance programs that were offered. I've found that they have been very responsive to my needs and I feel as though they probably offer the best rates and the best premiums that are available."

John F. Nelson, M.D.
Psychiatry
Gainesville, FL

Since 1906, the Southern Medical Association has been the best kept secret in the South. No longer! The word is out and everybody's talking.

They're talking about the educational benefits of belonging to the largest regional multi-specialty association in the U.S. and the diversity of the Annual Scientific Assembly.

They're talking about a non-political association whose only mission is to provide the best educational and financial benefits available anywhere.

They're also talking about unrivaled member benefits including the SMA Insurance Program, the Physicians' Purchasing Program, the SMA Retirement Program, SMA Travel Services, Dial Access, the *Southern Medical Journal* and many, many more.

But most of all, they're talking about how SMA can offer so much at such a low cost.

Call the SMA for more information and a membership application. Find out why more and more physicians are joining the SMA every day.

Join the SMA today . . . You'll be talking about us too!

Members in the News

Steven J. Mason MD has been named director of the Cardiac Care Unit (CCU) at Franklin Square Hospital Center.

Dr. Mason has been associated with Franklin Square since 1986. He came to Baltimore from the Hospital of St. Raphael in New Haven, CN, where he was associate director of the CCU. While in New Haven, Dr. Mason served as assistant clinical professor of Internal Medicine at the Yale University School of Medicine.

A graduate of Williams College and the Harvard Medical School, Dr. Mason did his internship and residency at Beth Israel Hospital in Boston. He completed a clinical fellowship at Harvard and a research fellowship at the National Institutes of Health in Bethesda. Since coming to Baltimore, he has become an assistant professor of Medicine at The Johns Hopkins University School of Medicine.

EQUAL HOUSING OPPORTUNITIES

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of $678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor:

MRI UPDATE

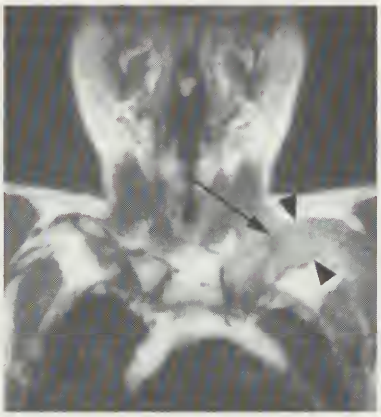

Figure 1

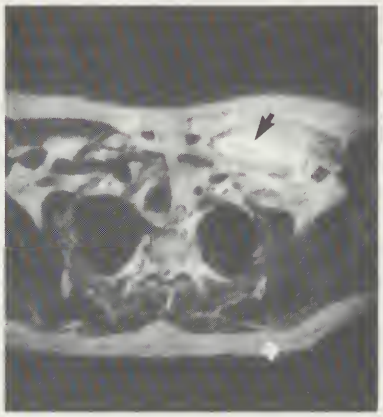

Figure 2

Figure 3

HISTORY: This patient is a 45 year old male who, on minor trauma, felt a popping sensation in his left sterno-clavicular region. Diffuse swelling developed and progressed down the left anterior chest wall over the next few weeks. A CT scan demonstrated a fracture of the midportion of the clavicle with minimal asymmetry of the soft tissues.

MRI FINDINGS:

Coronal images demonstrated disruption of the midportion of the left clavicle (Fig. 1, long arrow) with intermediate signal intensity material extending into the adjacent muscles (arrowheads). Transverse T2 weighted images (Fig. 2) show an area of increased signal intensity in the region of the clavicular fracture with extensive intermediate signal intensity material extending into the surrounding muscles. The high signal area most likely represents a hematoma surrounding the fracture (short arrow). The more diffuse intermediate signal represents diffused blood and/or edema in the surrounding muscles. T1 weighted images (Fig. 3) demonstrated low signal in the region of the clavicle near the sternoclavicular joint (small arrow, compare to high signal of right clavicle, arrowhead). The low signal indicates a bone marrow replacing process. Given the history of fracture following minor trauma, low signal intensity within the left clavicle increases suspicion of underlying malignancy rather than post traumatic edema. Biopsy showed undifferentiated carcinoma.

MRI HIGHLIGHTS:

While the fracture and minimal asymmetry of the soft tissues can be identified on the CT scan, this case illustrates the superior soft tissue contrast differentiation of MRI. Changes that are difficult to appreciate on the CT scan become obvious on MRI, which is rapidly becoming the method of choice for evaluating occult soft tissue abnormalities.

If arthritis isn't so serious, why is it costing America over 14 billion dollars a year?

One in seven Americans has arthritis.
And it often strikes them in their peak earning years.
Every day, thousands of wage-earners are forced to leave their jobs. They can no longer cope with the pain and crippling of arthritis.

And that costs.

It costs in medical and disability payments, lost wages, lost taxes and lost time in the work place. Over twenty-seven million working days are lost each year because of it.

The Arthritis Foundation is the only voluntary health organization fighting arthritis on every front. We sponsor research, self-help programs, and professional and public education.

But we can't do it alone.

Support the Arthritis Foundation. Contact your local chapter or write: Arthritis Foundation, Department A, P.O. Box 19000, Atlanta, Georgia 30326.

FULL OR PART-TIME POSITION AVAILABLE - FAMILY PRACTICE: well-established, rapidly expanding practice with no OB. Salary and hours negotiable. Send CV to Prince George's County Medical Society, 7901 Annapolis Rd., Lanham, MD 20706, ATTN: Cliff Gilbert or call 301-459-1920.

FULL-TIME EMERGENCY PHYSICIAN POSITION available immediately and/or July for a career-oriented emergency physician to complement a fee-for-service group with 18,000 annual ED visits. ACLS required, BC/BP preferred. Excellent compensation and benefits package. Send CV to Anant B. Singh MD, Union Hospital, Elkton, MD 21921 or call 301-398-4000 X1400 or 398-1135.

INTERNAL MEDICINE PRACTICE FOR SALE Pikesville area. Modern, fully furnished front and back offices, 3 large exam rooms, consult, and x-ray rooms. Patient records, files, office equipment, EKG, etc. Easy parking 301-358-3370.

PEDIATRIC PRACTICE FOR SALE, Glen Burnie, MD. Box 2 *MMJ*, 1211 Cathedral St., Baltimore, MD 21201.

EXPERIENCED GENERAL SURGEON SEEKING RELOCATION to Baltimore/Washington area, BC in General Surgery and Surgical Critical Care. Box 5 *MMJ*, 1211 Cathedral St., Baltimore, MD 21201.

EASTERN SHORE PEDIATRIC OPENING for a BC/BE pediatrician to join busy practice in Chestertown, MD. John Morgan MD, PO Box 477, Chestertown, MD 21620 (301-778-1420).

BUSY PEDIATRIC PRACTICE has office space to share in our satellite office located in Upper Marlboro. Newly decorated and fully equipped 301-292-2200.

SUBLEASE NEW MEDICAL OFFICE in rapidly growing Pasadena area; subspecialty interest preferred, rent negotiable 301-255-2700.

PHYSICIAN: General medical, surgical, family practice, or orthopedic background.

To cover office practice while I am on vacation, approximately eight weeks/year.

No surgery, emergencies, fractures, nights or weekends.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

Contraindications: VASOTEC® (Enalapril Maleate, MSO) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been usetul in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See AOVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the tirst dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are tollowed; caution should be observed when initiating therapy. (See DOSAGE AND AOMINISTRATION.) Patients at risk tor excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion ot any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and AOVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in supine position and, if necessary, receive an intravenous intusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without ditticulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases ot neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring ot white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence ot inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first tew weeks ot therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Oosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See OOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors tor the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days ot therapy. It actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, tever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This intormation is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and OOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence ot clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Theretore, it concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation ot both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy—Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies in pregnant women. VASOTEC® (Enalapril Maleate, MSO) should be used during pregnancy only it the potential benefit justities the potential risk to the fetus.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for satety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 298/ patients.

Hypertension: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

Heart Failure: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (79%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial intarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE ANO ADMINISTRATION), prostate hypertrophy.

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared after discontinuation of therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause tor discontinuation of therapy in 1.9% ot patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% ot patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations ot liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Oosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. It blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance >30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management ot the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Oosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart failure patients with hyponatremia (serum sodium <130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE ANO ADMINISTRATION, *Heart Failure*, WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of tour days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

The Exclusive Valet Pick-Up & Delivery Dealer

Announcing the cure for Delayed Office Automation Syndrome.

You know the headaches. They never stop. Mountains of paperwork. Appointment scheduling. Insurance forms and claims submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Well, now there's finally an effective and affordable cure. The Medical System from American Digital Systems.

The A.D.S. Medical System. The features you need at a price that's easy to swallow.

Now any practice can afford to fully automate with a high performance, easy to use system.

Priced from under $10,000, each individually configured multi-user system comes complete with the hardware, software, support services and training to answer your needs now and for years to come. The A.D.S. Medical System is that flexible and expandable.

For a more thorough examination, call 876-4760.

Find out today how The A.D.S. Medical System can alleviate the headaches of managing and operating your practice. Call or write for more information. Better yet, ask for a free demonstration.

The A.D.S. Medical System. It can make a practice perfect.

The Editorial Board appreciates the efforts and fine work of the many contributors who sent photographs and transparencies for this cover. We hope you will continue to submit a variety of statewide medical scenes for future covers.

The views in this publication are those of the authors and do not necessarily reflect the opinion of the Medical and Chirurgical Faculty of the State of Maryland. Publishing an advertisement does not imply endorsement of any product, service offered, or approval of any representation made.

Manage your practice in ten-part HARMONY.®

1 **Comprehensive Solutions:** MTI's HARMONY integrates every business office function...data and word processing, claims submission, patient records, appointments scheduling, accounts management...into a comprehensive, turn-key practice management system.

2 **Customized Solutions:** Hardware, software, installation, training, AFTERCARE support, supplies...all custom-tailored to your individual practice.

3 **Unlimited Training:** For your current *and* future staff, for the life of your system.

4 **Over 1000 Doctors:** MTI's systems are meeting the practice management needs of hundreds of physicians...in every specialty, all across the country.

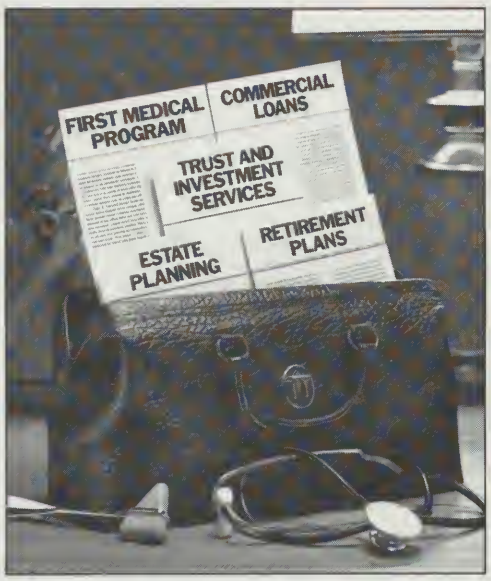
5 **Compatibility:** We offer a free evaluation of your system and practice and help you determine lowest-cost options for upgrades...and MTI's systems are compatible with IBM, Wang, DEC, TEXAS INSTRUMENTS and other major manufacturers.

6 **Conversion:** MTI specialists will transfer all practice data on your current system to the HARMONY system.No downtime, no overtime, no anxiety.

7 **Aftercare:** A phone call away, MTI technicians keep your system up and running...with vigilant support, extended service hours, guaranteed response time and repairs, software updates, and custom-programming options.

8 **Money-Back Guarantee:** Something rare among practice management vendors...a money-back guarantee! If HARMONY doesn't meet performance specifications, we'll refund your money.

9 **Non-Obsolescence Guarantee:** Every component offered by MTI is state-of-the-art and will stay that way... supplemented by ongoing system research, programming and enhancements offered to all clients on software maintenance.



10 **Price:** Best of all, HARMONY is competitively-priced *and* cost-effective. Call MTI at 800-777-7MTI.

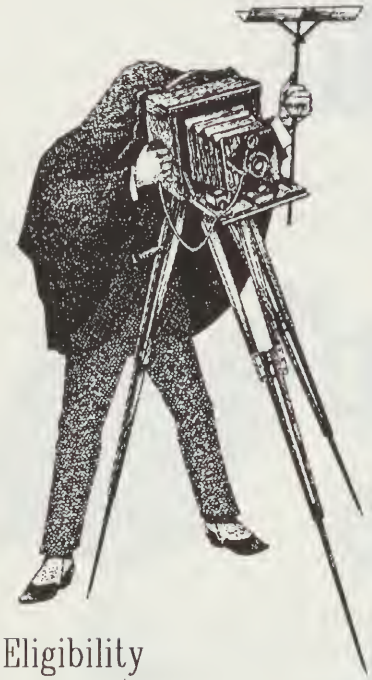
MTI **Perfecting Practice Management**

9790 Patuxent Woods Drive • Columbia, MD 21046 • 800-777-7MTI • (301) 720-6000

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.



To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Ninth Annual Med Chi Photo Contest

Enter Early -- Deadline For Entries: March 15,1989
Two Categories: Black & White Or Color
Open to Med Chi Members and Auxiliary Members
All Photographs on Display at the
Turf Valley Country Club
During the 1989 Annual Meeting
First and Second Prizes Awarded in Each Category

Eligibility

All members of the Faculty and members of the Auxiliary to the Medical and Chirurgical Faculty may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

Contest Rules

1. Photographs may be submitted in two categories-- Black and White or Color.

2. Limit: three entries per person

3. Entries must have name address, and telephone number attached to the back of each photograph.

4. Prints only, no smaller than 8x10 or larger than 11x14, will be accepted. If your favorite shot is a slide, you must have a print made to enter in the contest within these size ranges.

5. Entries may be mailed or brought to the Faculty Office, 1211 Cathedral Street, Baltimore, Maryland 21201 by the close of the business day on March 15, 1989.

6. Entries must be matted or dry mounted. No framed photographs will be accepted.

7. Photographs entered in the contest will be on display at the Annual Meeting in April of 1989.

8. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 12 thru 14, 1989.

9. Photographs will NOT be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting on Friday, April 14, at noon or at the Faculty Building thereafter.

10. The Faculty does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

11. Prizes will be awarded to the FIRST AND SECOND place winners. Additional information about the prizes will be published in the Journal.

DRUGS FOR TREATMENT OF PARASITIC INFECTIONS

Infection	Drug	Adult Dosage*	Pediatric Dosage*
AMEBIASIS (Entamoeba histolytica)			
asymptomatic			
Drug of choice:	Iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
Alternatives:	Diloxanide furoate[2]	500 mg tid x 10d	20 mg/kg/d in 3 doses x 10d
	Paromomycin	25-30 mg/kg/d in 3 doses x 7d	25-30 mg/kg/d in 3 doses x 7d
mild to moderate intestinal disease			
Drugs of choice:	Metronidazole[3,4]	750 mg tid x 10d	35-50 mg/kg/d in 3 doses x 10d
	followed by iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
Alternative:	Paromomycin	25-30 mg/kg/d in 3 doses x 7d	25-30 mg/kg/d in 3 doses x 7d
severe intestinal disease			
Drugs of choice:	Metronidazole[3,4]	750 mg tid x 10d	35-50 mg/kg/d in 3 doses x 10d
	followed by iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
Alternatives:	Dehydroemetine[2,5]	1 to 1.5 mg/kg/d (max. 90 mg/d) IM for up to 5d	1 to 1.5 mg/kg/d (max. 90 mg/d) IM in 2 doses for up to 5d
	followed by iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
	OR Emetine[5]	1 mg/kg/d (max. 60 mg/d) IM for up to 5d	1 mg/kg/d in 2 doses (max. 60 mg/d) IM for up to 5d
	followed by iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
hepatic abscess			
Drugs of choice:	Metronidazole[3,4]	750 mg tid x 10d	35-50 mg/kg/d in 3 doses x 10d
	followed by iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
Alternatives:	Dehydroemetine[2,5]	1 to 1.5 mg/kg/d (max. 90 mg/d) IM for up to 5d	1 to 1.5 mg/kg/d (max. 90 mg/d) IM in 2 doses for up to 5d
	followed by chloroquine phosphate	600 mg base (1 gram)/d x 2d, then 300 mg base (500 mg)/d x 2-3 wks	10 mg base/kg (max. 300 mg base)/d x 2-3 wks
	plus iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
	OR Emetine[5]	1 mg/kg/d (max. 60 mg/d) IM for up to 5d	1 mg/kg/d (max. 60 mg/d) IM in 2 doses for up to 5d
	followed by chloroquine phosphate	600 mg base (1 gram)/d x 2d, then 300 mg base (500 mg)/d x 2-3 wks	10 mg base/kg (max. 300 mg base)/d x 2-3 wks
	plus iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
AMEBIC MENINGOENCEPHALITIS, PRIMARY			
Naegleria sp			
Drug of choice:	Amphotericin B[6,7]	1 mg/kg/d IV, uncertain duration	1 mg/kg/d IV, uncertain duration
Acanthamoeba sp			
Drug of choice:	see footnote 8		

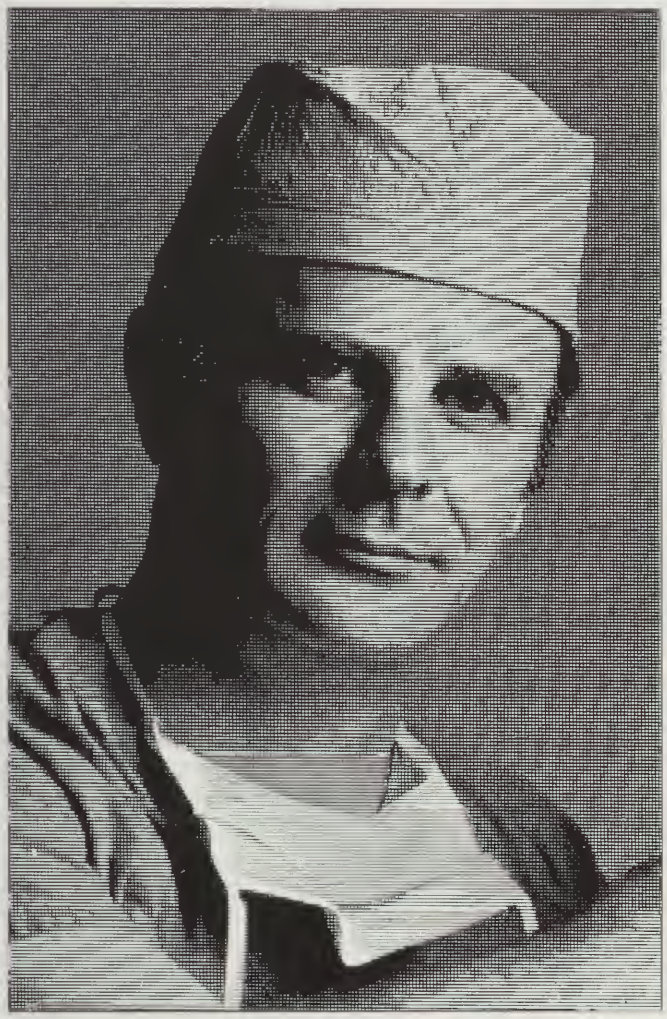
* The letter d indicates day

1. Dosage and duration of administration should not be exceeded because of possibility of causing optic neuritis; maximum dosage is 2 grams/day
2. In the USA, this drug is available from the CDC Drug Service, Centers for Disease Control, Atlanta, Georgia 30333; telephone: 404-639-3670 (evenings, weekends, and holidays: 404-639-2888).
3. Metronidazole is carcinogenic in rodents and mutagenic in bacteria, it should generally not be given to pregnant women, particularly in the first trimester.

Infection	Drug	Adult Dosage*	Pediatric Dosage*
Ancylostoma duodenale, see HOOKWORM			
ANGIOSTRONGYLIASIS			
Angiostrongylus cantonensis			
Drug of choice:	Mebendazole[7,9,10]	100 mg bid x 5d	100 mg bid x 5d for children >2 years
Angiostrongylus costaricensis			
Drug of choice:	Thiabendazole[7,9]	25 mg/kg tid x 3d[11] (max. 3 grams/day)	25 mg /kg tid x 3d[11] (max. 3 grams/day)
OR	surgical intervention		
ANISAKIASIS (Anisakis sp)			
Treatment of choice:	Surgical removal		
ASCARIASIS (Ascaris lumbricoides, roundworm)			
Drug of choice:	Mebendazole	100 mg bid x 3d	100 mg bid x 3d for children >2 years
OR	Pyrantel pamoate	11 mg/kg once (max. 1 gram)	11 mg/kg once (max. 1 gram)
Alternative:	Piperazine citrate	75 mg/kg (max. 3.5 grams)/d x 2d	75 mg/kg (max. 3.5 grams)/d x 2d
BABESIOSIS (Babesia sp)			
Drugs of choice:[12]	Clindamycin[7]	1.2 grams bid parenteral or 600 mg tid oral x 7d	20-40 mg/kg/d in 3 doses x 7d
	plus quinine	650 mg tid oral x 7d	25 mg/kg/d in 3 doses x 7d
BALANTIDIASIS (Balantidium coli)			
Drug of choice:	Tetracycline[7]	500 mg qid x 10d	10 mg/kg qid x 10d (max. 2 grams/d)
Alternatives:	Iodoquinol[1,7]	650 mg tid x 20d	40 mg/kg/d in 3 doses x 20d
	Metronidazole[3,7]	750 mg tid x 5d	35-50 mg/kg/d in 3 doses x 5d
BLASTOCYSTIS hominis infection			
Drug of choice:	Iodoquinol[1]	650 mg tid x 20d	30-40 mg/kg/d in 3 doses x 20d
OR	Metronidazole[3,7]	750 mg tid x 10d	35-50 mg/kg/d in 3 doses x 10d
CAPILLARIASIS (Capillaria philippinensis)			
Drug of choice:	Mebendazole[7]	200 mg bid x 20d	200 mg bid x 20d
Alternative:	Thiabendazole[7]	25 mg/kg/d x 30d	25 mg/kg/d x 30d
Chagas' disease, see TRYPANOSOMIASIS			
Clonorchis sinensis, see FLUKE infection			
CRYPTOSPORIDIOSIS			
Cryptosporidium sp			
Drug of choice:[13]	Spiramycin	1 gram tid PO x 14d or more	
CUTANEOUS LARVA MIGRANS (creeping eruption)			
Drug of choice:	Thiabendazole	25 mg/kg bid (max. 3 grams/d) x 2-5d and/or topically	25 mg/kg bid (max. 3 grams/d) x 2-5d and/or topically
Cysticercosis, see TAPEWORM infection			
DIENTAMOEBA fragilis infection			
Drug of choice:	Iodoquinol[1]	650 mg tid x 20d	40 mg/kg/d in 3 doses x 20d
OR	Tetracycline[7]	500 mg qid x 10d	10 mg/kg qid x 10d (max. 2 grams/d)
OR	Paromomycin	25-30 mg/kg/d in 3 doses x 7d	25-30 mg/kg/d in 3 doses x 7d
Diphyllobothrium latum, see TAPEWORM infection			
DRACUNCULUS medinensis (guinea worm) infection			
Drug of choice:	Metronidazole[3,7]	250 mg tid x 10d	25 mg/kg/d (max. 750 mg/d) in 3 doses x 10d
Alternative:	Thiabendazole[7]	25-37.5 mg/kg bid x 3d[11]	25-37.5 mg/kg bid x 3d[11]
Echinococcus, see TAPEWORM infection			
Entamoeba histolytica, see AMEBIASIS			
ENTAMOEBA polecki infection			
Drugs of choice:	Metronidazole[3,7]	750 mg tid x 10d	35-50 mg/kg/d in 3 doses x 10d
	followed by		
	diloxanide furoate[2]	500 mg tid x 10d	20 mg/kg/d in 3 doses x 10d
ENTEROBIUS vermicularis (pinworm) infection			
Drug of choice:	Pyrantel pamoate	a single dose of 11 mg/kg (max. 1 gram); repeat after 2 weeks	A single dose of 11 mg/kg (max. 1 gram); repeat after 2 weeks
OR	Mebendazole	A single dose of 100 mg; repeat after 2 weeks	A single dose of 100 mg for children >2 years; repeat after 2 weeks
Fasciola hepatica, see FLUKE infection			

4. Outside the USA, ornidazole and tinidazole are also used.
5. Dehydroemetine is probably as effective and probably less toxic than emetine. Because of its toxic effects on the heart, patients receiving emetine should have electrocardiographic monitoring and should remain sedentary during therapy.
6. One patient with a Naegleria infection was successfully treated with amphotericin B, miconazole, and rifampin (JS Seidel et al, N Engl J Med, 306:346, 1982).
7. Considered an investigational drug for this condition by the U.S. Food and Drug Administration.

Infection	Drug	Adult Dosage*	Pediatric Dosage*
FILARIASIS			
Wuchereria bancrofti, Brugia (W.) malayi, Mansonella ozzardi, Loa loa			
Drug of choice:[14]	Diethylcarbamazine[15]	Day 1: 50 mg, oral, p.c. Day 2: 50 mg tid Day 3: 100 mg tid Days 4 through 21: 2 mg/kg tid	Day 1 : 25-50 mg Day 2: 25-50 mg tid Day 3: 50-100 mg tid Days 4 through 21: 2 mg/kg tid
Mansonella perstans			
Drug of choice:[16]	Mebendazole[7]	100 mg bid x 30d	
Tropical eosinophilia			
Drug of choice:	Diethylcarbamazine	2 mg/kg tid x 7-10d	2 mg/kg tid x 7-10d
Filariasis			
Onchocerca volvulus			
Drug of choice:	Ivermectin[7,17]	150 μg/kg PO once, repeated every 6 to 12 months	150 μg/kg PO once
Alternatives:	Diethylcarbamazine[15]	25 mg/d x 3d, then 50 mg/d x 5d, then 100 mg/d x 3d, then 150 mg/d x 12d	0.5 mg/kg tid x 3d (max. 25 mg/d), then 1.0 mg/kg tid x 3-4d (max. 50 mg/d), then 1.5 mg/kg tid x 3-4d (max. 100 mg/d), then 2.0 mg/kg tid x 2-3 wks
	followed by suramin[2,18]	100-200 mg (test dose) IV, then 1 gram IV at weekly intervals x 5 wks	10-20 mg (test dose) IV, then 20 mg/kg IV at weekly intervals x 5 wks
FLUKE, hermaphroditic, infection			
Clonorchis sinensis (Chinese liver fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 2d	25 mg/kg tid x 2d
Fasciola hepatica (sheep liver fluke)			
Drugs of choice:[19]	Bithionol[2]	30-50 mg/kg on alternate days x 10-15 doses	30-50 mg/kg on alternate days x 10-15 doses
Fasciolopsis buski (intestinal fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 1d	25 mg/kg tid x 1d
OR	Niclosamide[7]	a single dose of 4 tablets (2 g) chewed thoroughly	11-34 kg: a single dose of 2 tablets (1g) >34 kg: a single dose of 3 tablets (1.5 g)
Alternative:	Tetrachloro-ethylene[20]	0.1 ml/kg (max. 5 ml)	0.1 ml/kg (max. 5 ml)
Heterophyes heterophyes (intestinal fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 1d	25 mg/kg tid x 1d
Metagonimus yokogawai (intestinal fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 1d	25 mg/kg tid x 1d
Opisthorchis viverrini (liver fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 1d	25 mg/kg tid x 1d
Paragonimus westermani (lung fluke)			
Drug of choice:	Praziquantel[7]	25 mg/kg tid x 2d	25 mg/kg tid x 2d
Alternative:	Bithionol[2]	30-50 mg/kg on alternate days x 10-15 doses	30-50 mg/kg on alternate days x 10-15 doses
GIARDIASIS (Giardia lamblia)			
Drug of choice:	Quinacrine HCl	100 mg tid p.c. x 5d	2 mg/kg tid p.c. x 5d (max. 300 mg/d)
Alternatives:	Metronidazole[3,4,7]	250 mg tid x 5d	5 mg/kg tid x 5d
	Furazolidone	100 mg qid x 7-10d	1.25 mg/kg qid x 7-10d
GNATHOSTOMIASIS (Gnathostoma spinigerum)			
Treatment of choice:	Surgical removal		
OR	Mebendazole[7,21]	200 mg q3h x 6d	



8. Experimental infections with Acanthamoeba sp. have been reported to respond to sulfadiazine (CG Culbertson, Annu Rev Microbiol, 25:231, 1971). Amebic keratitis due to Acanthamoeba sp. has been reported to respond to topical miconazole, propamidine isethionate, and antibiotics (MB Moore et al, Am J Ophthalmol, 100:396, 1985).
9. Effectiveness documented only in animals
10. Analgesics, corticosteroids, and careful removal of CSF at frequent intervals can relieve symptoms. Albendazole and ivermectin have been used successfully in animals.
11. This dose is likely to be toxic and may have to be decreased.
12. Concurrent use of pentamidine and trimethoprim-sulfamethoxazole has been reported to cure an infection with B. divergens (D Raoult et al, Ann Intern Med, 107:944, 1987).
13. Limited clinical results suggest a decrease in diarrhea with therapy. Infection is self-limiting in immunocompetent patients.
14. Several reports indicate that ivermectin may be effective for treatment of W. bancrofti (S Diallo et al, Lancet, 1:1030, 1987) and M. ozzardi (TB Nutman et al, J Infect Dis, 156:662, 1987).

Infection	Drug	Adult Dosage*	Pediatric Dosage*
HOOKWORM infection (Ancylostoma duodenale, Necator americanus)			
Drug of choice:[22]	Mebendazole	100 mg bid x 3d	100 mg bid x 3d for children >2 years
	OR Pyrantel pamoate[7]	11 mg/kg (max. 1 gram) x 3d	11 mg/kg (max. 1 gram) x 3d
Hydatid cyst, see TAPEWORM infection			
Hymenolepis nana, see TAPEWORM infection			
ISOSPORIASIS (Isospora belli)			
Drug of choice:	Trimethoprim-sulfamethoxazole[7,23]	160 mg TMP, 800 mg SMX qid x 10d, then bid x 3 wks	
LEISHMANIASIS			
L. braziliensis, L. mexicana (American cutaneous and mucocutaneous leishmaniasis)			
Drug of choice:[24]	Stibogluconate sodium[2]	20 mg/kg/d (max. 800 mg/d) IV or IM x 20d may be repeated or continued until there is a response	20 mg/kg/d IM or IV (max. 800 mg/d) x 20d
Alternative:	Amphotericin B[7]	0.25 to 1 mg/kg by slow infusion daily or every 2d for up to 8 wks	0.25 to 1 mg/kg by slow infusion daily or every 2d for up to 8 wks
Leishmaniasis			
L. donovani (kala azar, visceral leishmaniasis)			
Drug of choice:	Stibogluconate sodium[2,25]	20 mg/kg/d (max. 800 mg/d) IM or IV x 20d (may be repeated)	20 mg/kg/d IM or IV (max. 800 mg/d) x 20d
Alternative:	Pentamidine isethionate	2-4 mg/kg/d IM for up to 15 doses	2-4 mg/kg/d IM for up to 15 doses
L. tropica, L. major (oriental sore, cutaneous leishmaniasis)			
Drug of choice:	Stibogluconate sodium[2,26]	10 mg/kg/d (max. 600 mg/d) IM or IV x 6-10d (may be repeated)	10 mg/kg/d IM or IV (max. 600 mg/d) x 6-10d
Alternative:	Topical treatment[27]		
LICE infestation (Pediculus humanus, capitis, Phthirus pubis)[28]			
Drug of choice:	1% Permethrin[29]	Topically	Topically
Alternatives:	Pyrethrins with piperonyl butoxide	Topically[30]	Topically[30]
	Lindane	Topically[30]	Topically[30]
Loa loa, see **FILARIASIS**			
PNEUMOCYSTIS carinii pneumonia[31]			
Drug of choice:	Trimethoprim-sulfamethoxazole	TMP 20 mg/kg/d, SMX 100 mg/kg/d oral or IV in 4 doses x 14d	TMP 20 mg/kg/d, SMX 100 mg/kg/d oral or IV in 4 doses x 14d
Alternative:	Pentamidine isethionate	4 mg/kg/d IM x 14d	4 mg/kg/d IM x 14d
Roundworm, see ASCARIASIS			
SCABIES (Sarcoptes scabiei)			
Drug of choice:[32]	Lindane	Topically once	Topically
Alternatives:	Sulfur in petrolatum	Topically	Topically
	10% Crotamiton	Topically	Topically
SCHISTOSOMIASIS			
S. haematobium			
Drug of choice:	Praziquantel	20 mg/kg tid x 1d	20 mg/kg tid x 1d
S. japonicum			
Drug of choice:	Praziquantel	20 mg/kg tid x 1d	20 mg/kg tid x 1d
S. mansoni			
Drug of choice:	Praziquantel	20 mg/kg tid x 1d	20 mg/kg tid x 1d
Alternative:	Oxamniquine	15 mg/kg once[33]	10 mg/kg bid x 1d[33]
S. mekongi			
Drug of choice:	Praziquantel	20 mg/kg tid x 1d	20 mg/kg tid x 1d

15. Diethylcarbamazine should be administered with special caution in heavy infections with Loa loa because it can provoke ocular problems or an encephalopathy. Antihistamines or corticosteroids may be required to decrease allergic reactions due to disintegration of microfilariae in treatment of all filarial infections, especially those caused by Onchocerca and Loa loa. Surgical excision of subcutaneous Onchocerca nodules is recommended by some authorities before starting drug therapy.

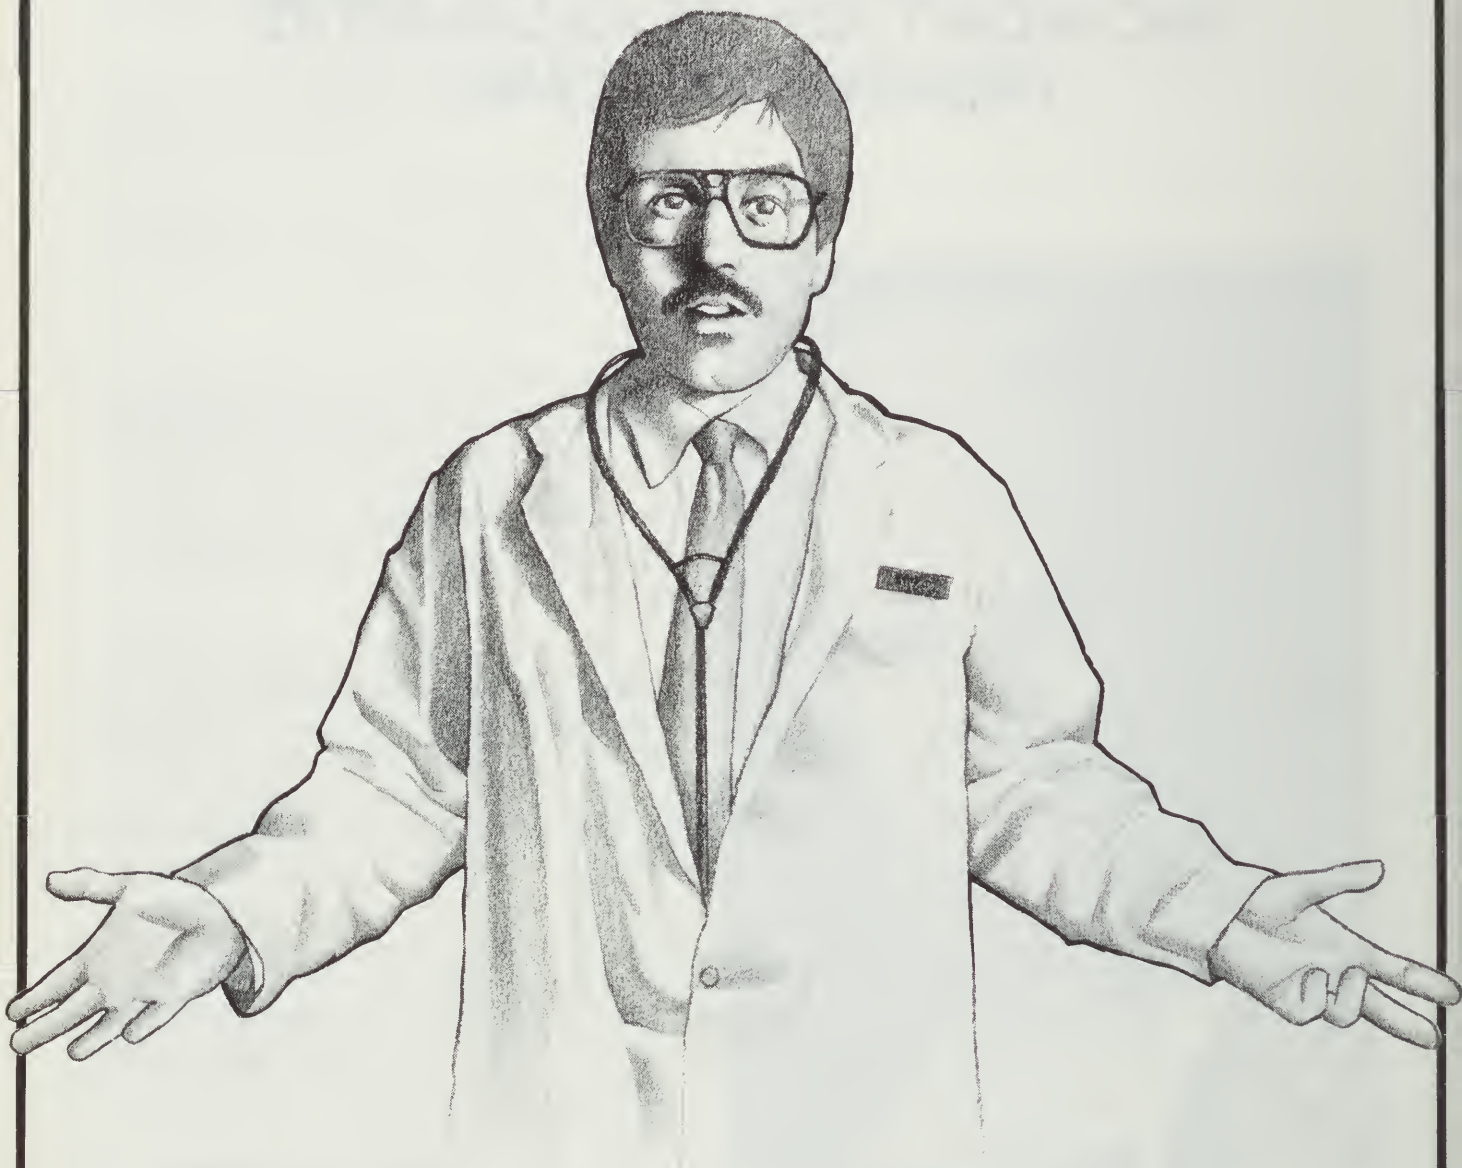
HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.



What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

Highlights: Executive Committee and Council Actions

Executive Committee - October 20, 1988

Participation in Safety Belt Program On recommendation of the Public Relations Committee, the Executive Committee approved a motion to support a campaign, through co-sponsorship with the Maryland Committee for Safety Belt Use, Inc., to enlist the assistance of Maryland physicians in educating the public on the proper use of safety belts and child safety seats to reduce the loss of life and severity of injuries associated with motor vehicle crashes. It was understood that this program would not be funded by Med Chi.

Licensing of Physicians with Infectious Diseases The Executive Committee reviewed correspondence from the Board of Physician Quality Assurance requesting Med Chi's advice or guidelines concerning the licensing of physicians with infectious diseases who wish to continue practicing surgery. It was the Executive Committee's decision to postpone action on this matter until after the AMA Interim Meeting in December, at which time the AMA Board of Trustees will present a report to the House of Delegates on this issue. In the meantime, a letter will be sent to the Board indicating the Executive Committee's action.

Committee on Third-Party Carriers The Committee on Third- Party Carriers has been asked to investigate two problem areas brought to the attention of Dr. Dobridge by concerned physicians. The first issue is regarding *nonpayment for hospital psychiatric services* determined by the utilization review program of Maryland Blue Cross/Blue Shield. The involved physicians will be meeting Maryland Blue Cross and Blue Shield representatives for resolution of this matter.

The second issue concerns *changes in claims processing of the Pennsylvania Blue Shield Medicare as Secondary Payor program*, resulting in a delay of Medicare reimbursements to physicians. Following action by Med Chi and the Montgomery County Medical Society, both HCFA Region III and Pennsylvania Blue Shield have indicated that action within the context of HCFA instructions has been taken to minimize the impact of this federal policy upon physicians in the areas of Pennsylvania BC/BS (Montgomery and Prince George's Counties).

Medical Waste Emergency Regulations Update The Committee was briefed on the medical waste emergency regulations that became effective October 1, 1988. The regulations require that physicians generating more than 50 kilograms (110 pounds) per month of medical waste must adhere to the maintenance of accurate disposal records and the use of only state-certified waste haulers. Gerry Evans stated that these revised regulations should not affect physicians since they are considered small waste producers. He added that physicians should be aware of haulers contacting their offices trying to sell waste disposal services that may not be necessary. Further information will be disseminated to physicians through the *Maryland Medical Journal.*

Professional Review Organization (PRO) R. Lane Wroth MD, Medical Director for the Delmarva Foundation for Medical Care, has informed the Faculty that the Delmarva Executive Committee accepted the subcontracting concept with the Maryland Foundation and the Prince George's Foundation and has authorized its Executive Director to develop the proposal further with staff representatives from Maryland Foundation for Health Care and Prince George's Foundation for Medical Care.

Emergency/OPD Diversion of Services Plan The Committee reviewed Med Chi's correspondence to Nelson J. Sabatini, Deputy Secretary for Health Care Finance, Policy and Regulation, requesting updated information on the implementation date of the diversion plan and a possible method for waiving certain area hospitals from this diversion requirement. Med Chi has surveyed its membership relative to their individual involvement in the Medical Assistance Program and what improvements could be made to increase physician participation. These survey results will be provided to Dr. Sabatini on completion of tabulation in an effort to enhance communication and cooperation.

Med Chi Survey on Uncompensated Care The draft Med Chi Uncompensated Care Survey was reviewed by the Executive Committee. The Governor's Commission on Uncompensated Care also has reviewed the survey and expressed their interest in assisting in this joint effort with Med Chi. Med Chi plans to conduct a trial survey of approximately 100 physicians. After discussion, the Executive Committee approved the distribution of the Uncompensated Care Survey to a designated physician group with details to be properly worked by staff.

Proposed Legislation Surrounding Withdrawal of Medical Services from Terminally Ill It was reported to the Committee that the State Bar Association has solicited Med Chi's comment on proposed legislation that would expand the list of parties who could provide substituted consent for initiating, withholding, or withdrawing medical treatment for disabled individuals. The Legislative Committee, the Medicolegal Committee, and the Committee on Professional Ethics will report their recommendations to Council at its November 19, 1988 meeting.

Committee on Hospital Medical Staffs Dr. Victor Hrehorovich, Chairman of the Committee on Hospital Medical Staffs, presented the following recommendations for review by the Executive Committee and forwarding to the Council for action:

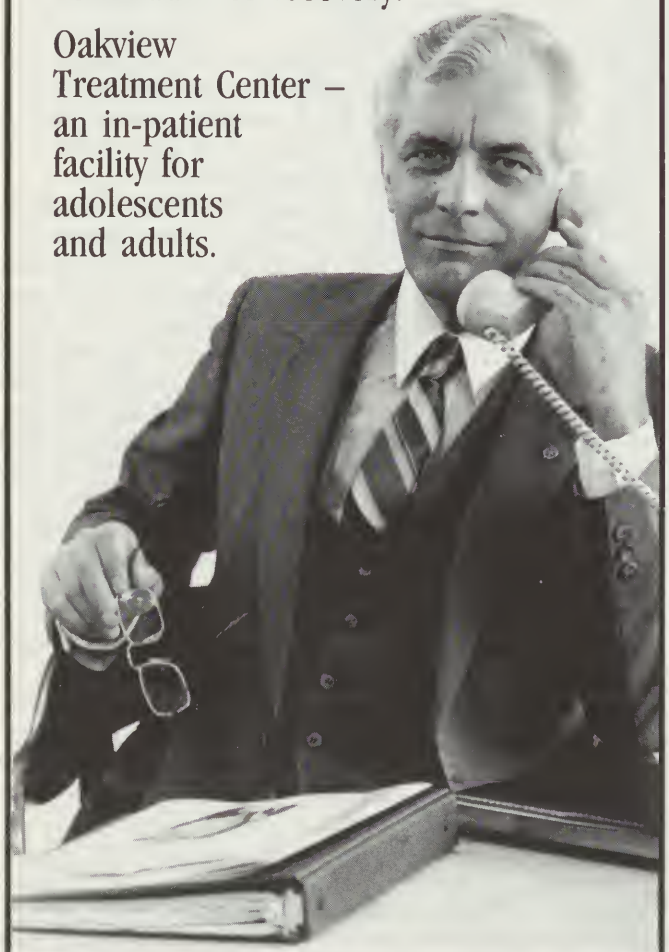
1. *Division of Licensing and Certification of the Department of Health and Mental Hygiene (hospital licensing authority)* - The Executive Committee approved, in concept, a proposal for strengthening ties with the Department of Health and Mental Hygiene regarding quality assurance activities.

2. *Med Chi Sponsored Consultation Service for Quality Assurance* - The Hospital Medical Staffs Committee has identified a need for a resource to provide expertise to

hospital medical staffs on the development and enhancement for quality assurance activities. Such services would be provided on a contractual basis and through the Med Chi service corporation.

3. *Risk Management - Risk-management seminars and programs should be made available to interested hospital medical staffs* - The Committee recommends that Med Chi consider contacting all professional liability insurers doing business in Maryland to obtain criteria for approved risk-management programs.

The Executive Committee thanked Dr. Hrehorovich for his presentation on behalf of the Committee on Hospital Medical Staffs and extended him an invitation, which he accepted, to address the November 19, 1988, meeting of the Council.



Referrals with many happy returns

If alcohol or other drug addiction is part of your patient's profile...let Oakview become part of your treatment team.

At Oakview we are committed to immediate and continuing recovery from addiction.

Our treatment plans reflect the involvement of the primary physicians in the continuum of recovery.

Maryland Medical Journal
Tentative Editorial Calendar - 1989

This is a tentative general listing of topics for 1989. Readers and authors are invited to contribute their articles, comments, and letters to the editor for any issue. All manuscripts are reviewed by the Editorial Board and accepted or rejected on their merits. Publication lead time is approximately three months; for example, for the August issue, copy should be submitted by May 1.

Theme issues will include other unrelated articles; authors are encouraged to submit articles/comments/letters for any theme issue. Dedicated issues will deal with only one topic. *MMJ* will consider suggestions from readers for issues still open.

April History of Bacteriology (to 1925) and Medical Microbiology (since 1925) in Maryland (theme issue)
May Computers in Medicine (theme issue)
June International Health Activities in Maryland Istitutions (dedicated issue)
July University of Maryland - Department of Medicine
August Annual Reports (dedicated issue)
September open
October open
November Genetics (dedicated issue)
December Semiannual Meeting and Reports (theme issue)

Information for Authors

Med-Chi members reading papers before organizations are invited to submit their papers to the MMJ for consideration for publications.

The *Maryland Medical Journal* is the monthly publication of the Medical and Chirurgical Faculty of the State of Maryland. Its goals are educational and informative: the publishing of scientific articles and other technical information as well as editorials, special articles (evaluations, position papers, reviews of nonscientific subjects), membership news, notices of medical events, legislative and governmental news, meetings, continuing education courses, and programs and policies of the Faculty.

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by the editor, editorial board members, and guest reviewers. The final decision is reserved for the Editor.

Specifications

Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables, and references) with margins of at least one inch. Number pages consecutively. Please submit two additional copies.

Include in the manuscript the concise title, full name of the author (or authors) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

An introductory synopsis/abstract of approximately 100-150 words is required.

Tables are to be typed on separate sheets of paper numbered, and have a brief descriptive title. The Editor reserves the right to edit tables. Be sure that statistics are consistent in both tables and text.

References are limited to those citations noted in the text. References are to be typed double-spaced and numbered consecutively as they appear in text. They will be examined critically at the time of review and must be kept to a minimum. The number of references is generally limited to 20 in major contributions and fewer in shorter articles. Exceptions may be made if appropriate in the opinion of the reviewing editor. Personal communications and unpublished data should not be included. The following are necessary: names of all authors, complete title of article cited (lower case), name of journal abbreviated according to Index Medicus, volume number, first and last page numbers, and year of publication. For more extensive information about preparing medical articles for publication, the editors suggest the International Committee on Medical Journal Editors: Uniform requirements for manuscripts submitted to biomedical journals. The complete document is available in the June 1982 issue of the *Annals of Internal Medicine*.

Illustrations are material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper. *Omit illustrations that do not increase understanding of text, and limit them to a reasonable number.* Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Legends are to be typed on a separate sheet of paper. Type on a gummed label and affix to the back of each illustration: figure number, title of manuscript, name of senior author, and arrow indicating top. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs and drawings. Cost of printing color photographs must be borne by the author.

Recognizable photos of patients are to be masked and should carry with them written permission for publication.

Permissions. When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright. Material published in the Journal is protected by copyright and may not be reproduced without the written permission of both the author and the Journal.

Editorial Responsibility

Manuscripts are subject to editorial modification and such revisions necessary to bring them into conformity with *Journal* style.

Galley proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Statements made or opinions expressed by any contributor is any article or feature published in the *Journal* are the sole responsibility of the author.

You take care of your patients... We'll take care of the paperwork

Executive Director's Newsletter

March 1989

NEW MEDICARE PART-B REQUIREMENTS

On April 1, 1989 physicians will be required to use ICD-9 codes on all Medicare Part B claims. The AMA has persuaded HCFA to delay enforcement of the provision until June 1, 1989 in order to apprise physicians of the change. Failure of physicians to comply with the requirement could result in monetary penalties of up to $2,000 per incident, or even exclusion from the Medicare program.

MED CHI RESOLUTIONS

On January 28, 1989, the Med Chi Council passed a resolution that would support efforts toward legislation that would limit the sale of tobacco products in Maryland. The Council also passed a resolution that would encourage the AMA to work in conjunction with State Medical Societies, the restaurant industry, and the media to make unsaturated margarine available in all restaurants.

ETHICS IN PATIENT REFERRAL ACT

Congressmen Pete Stark (D-CA), plans to introduce a bill, "Ethics in Patient Referral Act," that would prevent Medicare payment to physicians who refer patients to facilities in which they have a financial interest. Stark is soliciting members of the Ways and Means Committee to co-sponsor the bill. The AMA opposes the proposed legislation since it is anticompetitive and overlooks the potential benefits of physician investments being used to broaden access of care.

MANDATED MEDICARE ASSIGNMENT BILL

Rep. Brian J. Donnelly (D-MA) has reintroduced bill H.R. 155 for Mandated Medicare Assignment. Donnelly's proposal has been rejected several times by the House Ways and Means Committee and by other Congressional health committees. The AMA has conducted several legislative efforts to fend off mandatory assignment by educating members of Congress on the detrimental aspects that such a policy would create

and on how the Medicare reimbursement system works. According to the AMA, there is no indication that mandatory assignment will be a significant issue in the 101st Congress.

PHYSICIAN REQUIREMENTS FOR HOME HEALTH CARE

Physicians with patients requiring home health care must comply with new regulations obligating physicians to submit signed orders to the home health agency within 10 days. Home health agencies who fail to receive signed orders within 10 days must discharge patients from their care, according to the Code of Maryland Regulations, Section 10.07.10. The MD Assn for Home Care (MAHC) worked to change the previous law which prohibited home health agencies from accepting any patient for skilled care without signed physician orders. MAHC felt that the requirement for immediate signature by physicians was unduly restrictive since many physicians orders are given verbally and subsequently signed and mailed to the agency. As a result of MAHC efforts, the Maryland General Assembly has now allowed a period of 10 days to have signed orders from the physician in order to provide skilled care to patients.

ANNUAL MEETING GOLF TOURNAMENT

A Golf Tournament will begin at 10 a.m. on Tuesday, April 11, at the Turf Valley Country Club. Coffee and donuts will be available prior to the start, and lunch will be served following the tournament. Prizes will be awarded. The $50 entry fee includes golf cart and greens fees. To register contact Ann Clark in the Annapolis Office at 301-268-6872.

CONSULTATION

Med Chi co-sponsors a phone-in radio talkshow called CONSULTATION that airs nationally from 5-9 p.m. each Saturday. Med Chi is currently seeking physicians and topics for the program. Interested physicians should contact Betsy Newman, Public Relations for the Faculty at 301-539-0872 or 1-800-492-1056 in Maryland.

Angelo J. Troisi, FACHE
Executive Director

Quality Practice Digest

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state.

The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

DURABLE POWER OF ATTORNEY FOR HEALTH CARE

A physician and the physician's patient need to be aware of the legal mechanisms that are available under Maryland Law for making clear the wishes of the patient to refuse medical treatment. The living will and durable power of attorney for health care are two legal mechanisms that may be used to make known the medical decisions of the patient if the patient becomes incapacitated.

The documents will provide some legal protection for the physician who is following the wishes of the patient. The February issue of the MMJ contains a copy of the Maryland Living Will with a discussion of its limitations. See MMJ Vol. 38 No. 2.

The following is a sample durable power of attorney under which a patient may appoint a person to act on his behalf in making health care decisions if the patient becomes incapacitated:

DURABLE POWER OF ATTORNEY FOR MEDICAL TREATMENT

INFORMATION ABOUT THIS DOCUMENT

This is an important legal document. Before signing this document, it is vital for you to know and understand these facts:

This document gives the person you name as your agent the power to make health care decisions for you if you can't make decisions for yourself. Even after you have signed this document, you have the right to make health care decisions for yourself so long as you are able to do so. Your agent will be able to make decisions for you only after two physicians have certified that you are incapable of making them yourself. You have the right to revoke (take away) the authority of your agent by notifying your agent or your health care provider orally or in writing of this desire.

I,_____
(your name)

hereby appoint:_____
(agent's name)

_____
(agent's address and telephone)

as my agent to make health care decisions for me if and when I am unable to make my own health care decisions. This gives my agent the power to consent to giving, withholding or stopping any health care, treatment (including life-sustaining treatment), service, or diagnostic procedure. I specifically authorize my agent to make decisions for me about artificially supplied nutrition and hydration (tube feeding). My agent also has the authority to talk with health care personnel, get information, and sign forms necessary to carry out those decisions.

If the person named as my agent is not available or is unable to act as my agent, then I appoint the following person(s) to serve in the order listed below:

1._____
(agent's name)

_____
(agent's address and telephone)

2._____
(agent's name)

_____
(address and telephone)

By this document I intend to create a power of attorney for health care which shall take effect upon my incapacity to make my own health care decisions and shall continue during that incapacity.

I have discussed my wishes with my agent, and he or she shall make all health care decisions on my behalf, including decisions to withhold or withdraw all forms of life-sustaining treatment, including artificially administered hydration and nutrition.

My particular wishes are:

_____

_____

_____

BY SIGNING HERE I INDICATE THAT I UNDERSTAND THE PURPOSE OF THIS DOCUMENT

I sign my name to this form on_____
(date)

at:_____
(address)

_____
(you sign here)

WITNESSES

I declare that the person who signed or acknowledged this document is personally known to me, that he/she signed or acknowledged this durable power of attorney in my presence, and that he/she appears to be of sound mind and under no duress, fraud, or undue influence. I am not the person appointed as agent by this document, nor am I the patients's health care provider, or an employee of the patients's health care provider.

I further declare that I am not related to the patient by blood, marriage, or adoption, and, to the best of my knowledge, I am not entitled to any part of his/her estate under a will now existing or by operation of law.

For what insurance doesn't cover... MEDCASH™ The Health Care Credit Card.™

Designed exclusively for the health care industry by an affiliate of Blue Cross and Blue Shield of Maryland, MEDCASH™ offers patients a convenient way to pay for medical expenses not covered by their insurance.

At the same time, MEDCASH provides you, the physician, with improved cash flow, reduced billing expenses and fewer collection problems.

MEDCASH is now available to all creditworthy applicants, regardless of their insurance company or coverage. Cardholders enjoy a low interest rate, a 25-day grace period and up to 36 months to pay. MEDCASH. Working for health care professionals.

Blue Cross and Blue Shield of Maryland.
Call 1-800-633-9336 for information.

THE LOWER RESPIRATORY TRACT—

More vulnerable to infection in smokers and older adults

Experience counts

Ceclor® Pulvules® 250 mg

cefaclor

think of it first

For respiratory tract infections due to susceptible strains of indicated organisms.

Summary.
Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins.
Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] and toxic epidermal necrolysis or the above skin manifestations accompanied by arthritis/arthralgia, and frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%, and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology
- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly).

Concerns about the Use of Portable Cholesterol Analyzers

STEPHEN HAVAS MD, MPH, MS

While there is growing interest and concern about the role of portable cholesterol analyzers in clinical practice, the evidence on the effectiveness of these devices is limited. It has been shown that a number of factors can affect the validity of the cholesterol readings. We present a cautionary view on use of these devices.

Despite downward trends over the past 20 years, heart disease remains the leading cause of death in the United States. Most of these deaths are due to coronary heart disease (CHD). Of the three major modifiable risk factors for CHD, elevated blood cholesterol (defined here as $\geq$200 mg/dl) may be the most important in that it may be a prerequisite for the development of coronary artery disease.[1]

The recently published "Report of the National Cholesterol Education Program Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults" classifies levels of blood cholesterol of 240 mg/dl or higher as high, levels from 200 mg/dl to 239 mg/dl as borderline high, and levels below 200 mg/dl as desirable.[2] Approximately 27 percent of the adult population aged 20 to 74 have blood cholesterol levels of 240 mg/dl or higher; another 30 percent have levels from 200 mg/dl to 239 mg/dl.[3] With almost 60 percent of adults having a blood cholesterol level above the desirable range, elevated blood cholesterol is clearly the most prevalent major risk factor for CHD.

Elevated blood cholesterol meets all the criteria normally considered necessary before instituting widespread screening.[4] First, it constitutes an important public health problem in terms of its prevalence and the severity of its consequences. Second, there is a reliable test for measuring it. Third, there is a long latent phase to the disease it causes, during which preventive measures can be instituted. Fourth, effective, safe treatments exist that can lower the prevalence of this risk factor and in turn can reduce the resulting morbidity and mortality.

The Adult Treatment Panel Report strongly recommended that all adults in the United States have their cholesterol levels tested by their physicians and that significant efforts be made to reduce these levels in the population. The report further recommended that special efforts be made to detect adults with elevated blood cholesterol and to have their physicians carefully evaluate, counsel/treat, and monitor them.

Despite the high prevalence of high and borderline high cholesterol levels in the US population, most adults do not know their level. A 1986 public survey indicated that 46 percent of adults reported having had their blood cholesterol checked, but only 7 percent reported knowing their actual level.[5] Only 8 percent had ever been told by a doctor that their level was high.

During the past five years, a variety of portable cholesterol testing devices have been designed and are now being marketed aggressively. Such devices offer many attractive features over traditional laboratory testing for blood cholesterol. Because they are portable, they can be used in a variety of settings: shopping malls, supermarkets, worksites, churches, and physicians' offices. The tests are relatively painless, requiring a fingerprick to extract a small amount of blood. The results are available within a matter of minutes, allowing for rapid feedback to the individual concerning his/her cholesterol level and its meaning. The cost of this test to the consumer is generally lower than is traditional laboratory testing.

Given these advantages, it is not surprising that many organizations and some physicians have begun using these machines to conduct cholesterol testing and monitoring. However, there are many unanswered questions concerning the efficacy of this new technology. Some important questions should be answered before widespread use of this technology occurs; research projects under way are designed to answer these questions.

Unanswered Questions

There are at least a dozen portable analyzers now on the market. The three most commonly used are the Boerhingher Reflotron, the Kodak Ektachem DT-60,

Dr. Havas is Associate Professor, University of Maryland School of Medicine, Department of Epidemiology and Preventive Medicine.

HBP Commentary is contributed by the Maryland Commission on High Blood Pressure and Related Cardiovascular Risk Factors, 201 W. Preston St., Baltimore, MD 21201 (301-225-5891). Editors: R. Patterson Russell MD, Past Chairman; Donald O. Fedder PharmBS, DrPH, Chairman; and Robert S. Epstein MD, MS Assistant Professor of Epidemiology, University of Maryland School of Medicine.

Carol Lewis ScD, former Executive Director of the Maryland Commission on High Blood Pressure and Related Cardiovascular Risk Factors, is now Director of Community Cardiovascular Programs at the Mary Imogene Bassett Hospital in Cooperstown, NY. Dr. Robert S. Epstein, an Assistant Professor of Epidemiology, University of Maryland School of Medicine, replaces Dr. Lewis as one of the editors of HBP Commentary.

and the Abbott Vision. Each instrument uses an enzymatic reagent system to measure cholesterol. The Reflotron can measure cholesterol from whole blood, plasma, or serum. A designated aliquot is placed on a reagent strip, which is read by a reflectance photometer. The Kodak Ektachem DT-60 requires an aliquot of serum or plasma obtained by centrifugation of a capillary or venous sample. An aliquot is placed on a slide containing reagents, which is then read by a reflectance photometer. The Abbott Vision centrifuges a sample of whole blood, plasma, or serum. This sample is then mixed with reagents and is read by a spectrophotometer.

The first, and perhaps most critical, unanswered question is whether these new devices provide reliable results. Two factors are important in assessing reliability: accuracy and precision. Accuracy is defined as agreement with the "true value," as determined by a reference laboratory that has been standardized for cholesterol measurements. Precision is defined as reproducibility of the measurement, that is, producing the same result on repeat determinations.

The Laboratory Standardization Panel (LSP) of the National Cholesterol Education Program has recommended that accuracy of blood cholesterol measurement methods currently in use by clinical laboratories should be within ±5 percent from the true value and within five years should be no greater than ±3 percent from the true value.[6] Also, clinical laboratories should initially achieve an overall precision consistent with a coefficient of variation (CV) of 5 percent or less; ultimately laboratories should achieve a CV of 3 percent or less. The coefficient of variation is calculated as follows: $\frac{\text{standard deviation}}{\text{mean}} \times 100$ percent

The LSP also recommended that cholesterol measurements made by all clinical laboratories in the US should be standardized so that cholesterol values are traceable to the Centers for Disease Control (CDC) reference method or the National Bureau of Standards (NBS) definitive method. Laboratories can accomplish this goal and also improve the accuracy and precision of their cholesterol measurements by using certified reference materials currently available from the NBS, the CDC, or the College of American Pathologists (CAP) to evaluate their cholesterol measurement methods and/or instruments.

The lack of reliability of many clinical laboratories currently performing cholesterol analyses was demonstrated recently in a survey of 5,000 laboratories by the CAP; lack of accuracy was a major finding of that survey.[6] To date, it has been difficult to standardize the portable cholesterol analyzers so that cholesterol values are traceable to the CDC or NBS methods, and good quality control samples for these devices have been lacking. These factors pose significant problems for ensuring reliable cholesterol determinations.

If these devices provide unreliable results, the public will not be well served by testing with portable analyzers. Individuals may be inappropriately assured that their blood cholesterol is in the desirable range (false negatives), when in fact their values are high and require dietary and possibly even drug therapy. Conversely, if individuals are inappropriately labeled as high (false positives), unnecessary concern may be generated. A similar problem could arise if patients who have been following cholesterol-lowering diets are retested and fail to show a reduction in their blood cholesterol level due to measurement error. The credibility of cholesterol testing as well as of treatment could be compromised by these types of problems.

Results of several evaluations of portable cholesterol analyzers in laboratory settings have now been published.[7,8] In general, these have shown that results for accuracy and precision that met current LSP guidelines could be obtained when the devices were operated by highly trained personnel. However, other studies have shown that when the analyzers were operated either by noncertified medical technologists or by nonlaboratory trained personnel such as physicians, nurses, or secretaries, performance deteriorated significantly and did not meet the LSP guidelines.[9,10]

Another unanswered question is whether these devices perform consistently over an extended period. Given their recent introduction to the market, few data exist concerning significant deteriorations in accuracy and precision the longer they are used.

Ongoing Research

Several major research projects on this subject are under way, funded by the NIH. Three projects (the Model Systems for Blood Cholesterol Screening Program) are evaluating the accuracy and precision of the Reflotron, the Ektachem DT-60, and the Vision when used over time in a variety of settings.[11] Findings from these projects should be published within one year. Other evaluations of portable cholesterol analyzers are being carried out in several community CHD prevention projects and in several laboratory based studies.

Interim Recommendations

A workshop for researchers in this field was conducted recently by the National Institutes of Health to assess the current state of portable cholesterol analyzers and to provide interim recommendations for those using them in screening settings. Data presented at this workshop indicated considerable variability in the accuracy of results obtained in various studies, only part of which was due to differences in training used by the operators. Frequent misclassification of individuals' cholesterol levels resulted. Both false labeling and false reassurance were common, even when the devices were operated by highly trained personnel.

The workshop made the following recommendations concerning these analyzers.[12]

1. Those using these devices should be trained by experienced laboratory personnel.

2. The accuracy and precision of the instrument should be carefully evaluated prior to use; if the results do not meet the LSP guidelines, the instrument should be returned to the manufacturer.

3. Quality control samples with cholesterol levels of about 200mg/dl and 240 mg/dl should be run each day before using the analyzer, after every twentieth sample, and at the end of the day; accuracy and precision should be calculated weekly and should meet LSP guidelines.

4. Split samples should be analyzed several times daily by the instrument and by a laboratory that has been standardized so that its cholesterol values are traceable to the CDC reference method or the NBS definitive method; the values obtained from the portable analyzer should continue to meet the LSP guidelines for accuracy.

5. Individuals tested with these portable analyzers should be told that measurements must be done on multiple occasions in order to have their cholesterol level correctly classified.

The final set of recommendations relates to education and follow-up of those tested. The importance of a lifelong, healthful diet should be emphasized for all those tested; translated into operational terms, this really means a diet with no more than 30 percent of the calories from fat. Follow-up of those identified as having high blood cholesterol levels is critical.

Conclusion

Elevated blood cholesterol represents one of the nation's greatest health problems. To successfully conquer this problem, most adults need to have their blood cholesterol level tested and take steps to maintain it in the desirable range. Many steps can assist in accomplishing this goal, ranging from education to dietary counseling to changing the food supply to use of medication.

It is essential, however, we ensure we provide our patients with accurate results. The new portable cholesterol analyzers may have considerable difficulty at this time in accomplishing this. For physicians who wish nonetheless to use these instruments now, the NIH workshop recommendations provide a useful and necessary guide for reducing inaccuracy and misclassification.

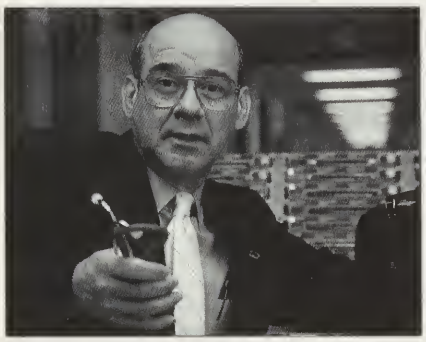
TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.



And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Somogyi Phenomenon

Doctor, what is the Somogyi Phenomenon?

Rebound hyperglycemia occurring after insulin-induced hypoglycemia is customarily called the Somogyi Phenomenon. The sequence of hyperglycemia following hypoglycemia is by no means invariable. It will depend on the severity of the hypoglycemia, the availability of body glucose to be released into the circulation, and other factors. When it occurs, it is within a few hours of the peak of the hypoglycemic episode. If rebound is encountered, one should not "chase" the hyperglycemia peaks with more insulin but allow the condition a day or two to become stabilized.

When the diagnosis is confirmed, the treatment usually is to slightly reduce the total 24 hour insulin dosage or to give the same amount in a different distribution of injections and unitage.

The phenomenon is often overdiagnosed on inadequate evidence. The most common cause of hyperglycemia remains a lack of insulin for the amount of food consumed.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service, 1211 Cathedral St., Baltimore, MD 21201; telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

CME Focuses on Strategies to Address Patients' Psychosocial Problems

It is estimated that at least one third of all patients seen in primary care practice have some significant psychosocial problem deserving physician attention. Moreover, patients with psychosocial disturbances are high users of nonpsychiatric medical care; some estimates of utilization are as much as twice that of the nondisturbed patient population. It appears this portion of the patient population takes the lion's share of physician time and resources.

The Johns Hopkins Medical Institutions recently received funding from the National Institute of Mental Health (NIMH) to develop and evaluate a communication skills training intervention program for community based primary care physicians with the aim of improving recognition and address of patients' psychosocial problems. The Maryland Academy of Family Physicians, the Maryland Society of Internal Medicine, the Medical and Chirurgical Faculty of the State of Maryland, the Center for Health Education, Inc., and the University of Maryland are cooperating in this effort.

Physicians in private or small group practice in the Greater Baltimore Metropolitan area will be invited to participate in the study. The CME program will be specifically designed to address the variety of psychosocial disorders as presented in primary care practice. The program will provide 8 CME credits. In return, participants will be expected to complete an evaluation protocol. For further information and details, call Dr. Debra Roter, 301-955-5660.

THE SECRET IS OUT

"I am very impressed with the SMA's Annual Meetings. I had not anticipated the diversity of the meetings and the specialties available as well as the postgraduate programs. I've participated in two courses and have been extremely impressed with the organization and content of the programs."

Nancy E. Pace, M.D.
Internal Medicine
Honolulu, Hawaii

Since 1906, the Southern Medical Association has been the best kept secret in the South. No longer! The word is out and everybody's talking.

They're talking about the educational benefits of belonging to the largest regional multi-specialty association in the U.S. and the diversity of the Annual Scientific Assembly.

They're talking about a non-political association whose only mission is to provide the best educational and financial benefits available anywhere.

They're also talking about unrivaled member benefits including the SMA Insurance Program, the Physicians' Purchasing Program, the SMA Retirement Program, SMA Travel Services, Dial Access, the *Southern Medical Journal* and many, many more.

But most of all, they're talking about how SMA can offer so much at such a low cost.

Call the SMA for more information and a membership application. Find out why more and more physicians are joining the SMA every day.

Join the SMA today . . . You'll be talking about us too!

Terminal Care: Where Does It Fit in Oncology?

Remember the Hippocratic Oath you took on the day you graduated from medical school . . .

> I do solemnly swear by whatever I hold most sacred: . . . that into whatsoever home I shall enter it shall be for the good of the sick and the well . . . that I will exercise my art, solely for the cure of my patients and the prevention of disease.

This is a vow to seek cure and to prevent illness. But, in the broader sense of the word *dis-ease*, it might also be interpreted that we should attempt to comfort the sick and remove the source of their uneasiness.

In American society there is an inherent conflict in pursuing comfort measures alone. We are a tough, winning society, and we have instilled in our children the idea that we can always be better. We can always fight harder. We can always depend on research to come up with a cure or, at least, a panacea for our ails. In addition somehow we have learned to equate death with failure. We can never "give in" to the dying process but must continue to fight to the very end with the hope of winning and achieving cure.

As oncologists and physicians treating people with cancer we often have to push patients through the pain of the postoperative period, side effects of radiation therapy, or a granulocytopenic infection after chemotherapy. None of these episodes alone is particularly pleasant, but we are sustained by a vision of cure. Later, when someone has "failed" therapy, we are obligated to "follow" our patients, but the goal is less clear; most of us never have received specific instruction on where to go from here.

The time after active therapy but before death is nebulous and ill defined. And who among us in comfortable with the unknown? As physicians we are expected to have an answer; as individuals we have come to expect answers from ourselves. Consequently, it is disconcerting when a patient might experience some symptom for which there is no remedy.

In contrast to this scenario in the United States, British physicians have developed the subspecialty of Palliative Care. Here the goal is no longer cure but the relief of symptoms that plague those in the terminal phase of an illness.[1] By alleviating such symptoms as pain, nausea, dizziness, constipation, shortness of breath, or anxiety the physician continues to "work for the good of the sick" by improving quality of daily life. The methods may not seem technically difficult in comparison with other current therapy but in part that may be because not as much research effort has been directed toward these types of interventions.

Palliative Care units exist in Great Britain, Canada, and Australia as places of training for medical students and other clinical disciplines. In the United States, most of this type of instruction is done through continuing education courses, hospices, and university based pain programs. The latter frequently are interdisciplinary groups including neurology/neurosurgery, anesthesia, psychiatry, and oncology or internal medicine. However, pain management in this setting is not specifically tailored to the dying patient.

Hospice, in the modern sense of the term, originated in 1966 in London, when Dame Cicely Saunders designed St. Christopher's Hospice for terminal cancer patients.[2] In 1973 the first hospice in the United States opened in New Haven, Connecticut, as a home-care program only. Now there are 1,679 hospice programs in the United States, and the emphasis has remained on home care rather than on inpatient treatment.[3]

As with other forms of home care, there has not been a large medical influence.[4] Many physicians have seen hospice care as a nursing arena. However, when Congress recognized the validity of hospice care by creating the Medicare Hospice Benefit, care of the terminally ill became a more legitimate part of general health care. Although a multidisciplinary approach is still the basis for daily hospice care, patients must be signed into the Medicare Benefit by two physicians, and each hospice team must include a medical director.[5]

Rendering care in the period from treatment failure to death can be a continuing challenge to our expertise as physicians.[6] We must encourage research into methods of pain and symptom management just as we have studied appropriate therapy for disease. Quality of life for the patient can be used as a measure of success.

Care of the terminally ill raises many moral and economic issues.[7] Each of us must consider where our own practice fits into this general scheme of things. More importantly, we must consider how we will fit terminal care into our own practice.

Members in the News

Susan R. Guarnieri MD was named President-elect of the Baltimore City Medical Society at its recent annual meeting. She will assume the presidency in December 1989.

Dr. Guarneiri received her MD degree from Ohio State University in 1966. She served an internship in Mixed Medical at Mount Carmel Hospital in Columbus, OH, from 1966 to 1967 and as a resident in Public Health at the Philadelphia Health Department from 1967 to 1968, after which she received her MPH from the Johns Hopkins University School of Hygiene and Public Health in 1969.

Dr. Guarnieri was Commissioner of Health for the City of Baltimore from 1984 until September 1987 when she became Medical Director of the Baltimore Gas and Electric Company. Dr. Guarnieri was Vice-President of the BCMS in 1986 and 1988 and was Treasurer in 1987.

* * *

Claude D. Hill MD received the 1988 Baltimore City Medical Society Community Service Award at the Society's Annual Meeting. The award is given each year to a Baltimore physician who has made a special contribution toward making Baltimore a better place in which to live.

Dr. Hill received the award for his long support of youth programs, health education, human and civil rights, and the delivery of quality medical care in the City. A specialist in OB/GYN, Dr. Hill practices in West Baltimore. He served as Chief of OB/GYN at Provident Hospital from 1958 to 1971 and has served as a Board member for the Baltimore Urban League, Maryland Blue Shield, the Maryland Chapter of the American Cancer Society, and the West Baltimore Community Health Center. He was appointed a member of the Baltimore City Council in 1987. In August 1988, Dr. Hill was appointed to the newly established Physician Quality Assurance Board, which grants medical licenses and disciplines physicians in Maryland.

In making the presentation, **Israel Weiner MD**, President of BCMS, said, "Dr. Hill has spent his entire career giving freely of his time and expertise to make Baltimore a better place to live. It is an honor to have him as a member of the Baltimore City Medical Society and a citizen of Baltimore."

* * *

Joseph H. Hooper MD has been elected Vice-President of the Baltimore City Medical Society. Dr. Hooper received his MD degree from the Johns Hopkins University in 1954. He served an internship at Union Memorial Hospital from 1954-1955, then served in the US Navy from 1956 to 1958 before completing his surgical residency training at Union Memorial Hospital from 1962 to 1963. Dr. Hooper entered private practice in General Surgery in 1963.

Dr. Hooper was Secretary of the BCMS in 1987 and 1988 and has served as a member and Chairman of the BCMS Peer Review Committee since 1984.

* * *

Allan D. Jensen MD was elected Treasurer of the Baltimore City Medical Society at it Annual Meeting. Dr. Jensen received his MD degree from the Johns Hopkins University in 1968. He served an internship at Union Memorial Hospital and a residency in Ophthalmology at Johns Hopkins Hospital. From February to April 1972 Dr. Jensen served an exchange residency at Khalili Hospital, Shiraz, Iran. In 1973 he completed a fellowship at Massachusetts Eye and Ear Infirmary and Retina Foundation, Boston.

* * *

Albert Nahum MD was elected Secretary of the Baltimoe City Medical Society. Dr. Nahum received his MD degree from the University of Istanbul Medical School in 1954 and served an internship and residency at Watte Hospital, Durham, NC. Dr. Nahum moved to Baltimore in 1964 and completed a fellowship in Internal Medicine at Johns Hopkins Hospital. Dr. Nahum was Treasurer of the BCMS in 1988.

* * *

Hiroshi Nakazawa MD was elected President of the Baltimore City Medical Socity at its Annual Meeting. Dr. Nakazawa graduated from Chiba University School of Medicine in Japan in 1956. Emigrating to Baltimore in 1957, he served surgical residencies at St. Agnes and Bon Secours Hospitals. Dr. Nakazawa served as Chief Resident in Surgery at St. Agnes in 1961 and entered private practice in General Surgery in 1962.

As chairman of the Baltimore/Kawasaki Sister Cities Program, Dr. Nakazawa was instrumental in arranging a number of cultural and educational exchanges between the two cities. He received the BCMS Community Service Award in 1987 for his efforts in this area, and in August 1988 he received a citation from President Reagan as one of the Ten Outstanding Asian Americans of 1988.

* * *

Sidney J. Pion MD has been appointed chairman of the department of radiology at Montgomery General Hospital in Olney.

Dr. Pion received his medical degree from the Albert Einstein College of Medicine in New York and served his residency at the Bronx Municipal Hospital Center. He was chief of the department of radiology at Beaufort Naval Hospital from 1971 to 1973. From 1973 to 1976 he was chief of special procedures and assistant professor of radiology at the University of North Carolina

Hospital and Medical School. Since 1976, Dr. Pion served as Vice-Chairman of the radiology department at Montgomery General. He also has been an assistant clinical professor of radiology at the George Washington University School of Medicine.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.
- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.
- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

Cytopathology: New Legislative, Regulatory, and Proficiency Testing Requirements

JOHN M. DEBOY DrPH and EDITH J. MOULTON MS

In 1988, a combination of efforts by the press, the Maryland General Assembly, the Department of Health and Mental Hygiene (DHMH), and an advisory panel of pathologists and cytotechnologists led to broader and stricter regulation of cytopathology laboratories in Maryland. A new law called for standards covering the maximum number of slides a cytotechnologist may examine, unsatisfactory specimens, slide and records retention, a limitation on the use of out-of-state laboratories by Maryland physicians, and a mandatory, state-run proficiency testing program. Maryland's proficiency testing program is modeled on that of New York State but incorporates improvements in diagnostic definitions, testing mechanisms, and retraining requirements.

Beginning in February 1987 and continuing through the spring of 1988, the national and local news media and Congress mounted a strong attack on the quality of testing conducted by the nation's clinical laboratories. Cytopathology laboratories first came under attack in a *Wall Street Journal* investigative series[1] that reported the death of a patient whose cervical cancer allegedly went undetected because her cervicovaginal (Papanicolaou) test specimens were read incorrectly.

Locally these laboratories came under renewed attack when a week-long, televised report[2] claimed that Papanicolaou tests had an error rate of 20 to 40 percent and that some laboratories required cytotechnologists to meet workload quotas and allowed them to take slides home to read. This report also placed states and the federal government under fire for failing to provide the statutory and regulatory structures needed to ensure testing quality.

In January of 1988 the Senate Labor and Human Resources Committee held hearings[3] in Washington, DC on laboratory testing problems affecting cancer detection in women. These hearings, which drew on the earlier televised report and included more testimony on misdiagnosed Papanicolaou stained slides, ended with a call for increased laboratory regulation.

Maryland's General Assembly accepted the media and congressional challenge during its 1988 session by introducing several bills to greatly expand the regulation of cytopathology laboratories. The final legislative product, House Bill 1293, was enacted on July 1, 1988, as additions to Health-General Article, Title 17, 202 and 205, Annotated Code of Maryland. This new law required specific standards for medical laboratories engaged in cytopathology, including mandatory laboratory participation in a state-run proficiency testing (PT) program.

The authors are with the Community Health Surveillance and Laboratories Administration's Division of Laboratory Licensure, Certification and Training. Reprints: Division of Laboratory Licensure, Certification and Training, Laboratories Administration, 201 West Preston St., Baltimore, MD 21201.

Maryland's Cytopathology Laboratories

A comprehensive survey form was mailed in February 1987 to 12 out-of-state and in April of 1987 to 81 in-state cytopathology laboratories holding Maryland permits to operate. This survey was intended to provide general information needed to develop expanded regulations and implement a new PT program for these laboratories. Three in-state labs no longer offered cytopathology services; and four others failed to respond. Seventy-four of 78 in-state laboratories that responded (95 percent) employed 162 pathologists and 132 cytotechnologists, and screened a total of 1,100,000 cerviocovaginal (Papanicoloau) smears in 1987.

Tables 1-4 show these in-state labs by geographic location, staff size, and total gynecologic and non-gynecologic slides/cases screened. Ten (23.5 percent) of 74 in-state labs paid cytotechnologists on a piecework basis. Twenty-nine (22 percent) of 132 in-state cytotechnologists were employed by more than one laboratory. Eight (67 percent) of the 12 out-of-state

Table 1. Cytopathology Labs Licensed and Operating in Maryland, April 1988, by Geographic Location

Baltimore City	20
Baltimore metropolitan area (Baltimore, Anne Arundel, Howard, & Harford Counties)	21
District of Columbia	1
Metropolitan DC (Prince Georges, Montgomery, & Calvert Counties)	20
Other regions within Maryland	13
Other regions outside MD and DC	11
Total	86

Table 2. Licensed Cytopathology Laboratories in Maryland, April 1988, by Size of Professional Staff

1-2 cytotechnologists	34
3-5 cytotechnologists	12
>5 cytotechnologists	6
Total	72

labs were licensed by New York State as well as by Maryland and participated in New York's cytopathology PT program. Two additional out-of-state labs were either certified or had certification pending by the American Society of Cytology.

New Legislation and Regulations

Maryland's new law specifically addresses many of the potential abuses and problems identified by the press and presented in public testimony. For example, the DHMH must set a limit on the number of slides a cytotecnologist may examine. The Department is seeking to limit this number to 80 or 100 slides in each 24 hours. This would provide state limits equivalent to those proposed by the federal Health Care Financing Administration for Medicare-certified laboratories.

Cytotechnologists are now prohibited by Maryland law, as well as by federal Medicare regulation, from examining cytology slides outside a licensed medical laboratory, and laboratories may no longer pay cytotechnologists on a piecework basis. In addition, out-of-state labs that pay cytotechnologists on such a basis are no longer eligible for a Maryland permit. Maryland also requires that cytology labs have a supervisory cytotechnologist or pathologist review at least 10 percent of previously screened slides. Medicare-certified labs already were required by federal regulations to rescreen 10 percent of their slides.

Table 3. Cervicovaginal Slides Screened by Licensed Cytopathology Laboratories in Maryland, 1987

No. of Slides	No. of Labs	No. of Slides	No. of Labs
<1,000	19	35,000 - 39,999	2
1,000 - 4,999	22	50,000 - 54,999	2
5,000 - 9,999	9	80,000	1
10,000 - 14,999	8	104,000	1
15,000 - 19,999	3	106,000	1
20,000 - 24,999	5	228,000	1
Total	74		

Table 4. Medical (Noncervicovaginal) Slides/Cases Screened by Licensed Cytopathology Laboratories in Maryland, 1987

No. of Medical Slides/Cases	No. of Labs
0	8
1-100	18
101-1,000	18
1,001-10,000	30
Total	74

*Survey data did not distinguish between slides and cases for noncerviocovaginal specimens.

Maryland cytopathology laboratories must now reject unsatisfactory specimens, comment on the quality of such specimens, and maintain records on these unsatisfactorily prepared specimens for five years. In addition, labs must store and maintain all slides for five years and retain all cytopathology reports for at least ten years.

The new law also prohibits Maryland physicians from submitting cytopathology specimens to out-of-state labs not licensed in Maryland. This requires a physician to personally ascertain whether a given cytopathology laboratory holds a Maryland permit. This information and a list of labs possessing this permit can be obtained from the DHMH's Division of Laboratory Licensure, Certification and Training by calling 301-225-6080.

Maryland's new law also directs the DHMH to adopt regulations to establish and conduct a cytology proficiency testing program for all cytology personnel in Maryland who examine cytology specimens. The law requires that this PT be conducted on-site (that is, within the labs), that test materials be hand carried and testing be supervised by a DHMH official, and that PT fees cover the full cost of the PT program.

Proficiency Testing

The DHMH began laying the groundwork for a state-run proficiency testing program by working closely with the press and members of the General Assembly in the fall of 1987. By January 1988 it became apparent that a PT bill would be passed by the General Assembly, and the Department invited a number of Maryland-based experts to serve as advisors on laboratory issues associated with cytopathology. This advisory panel[4] met ten times between January 26, 1987 and January 11, 1989 to develop regulatory standards and PT mechanisms for cytopathology labs.

Maryland's cytopathology PT program is modeled, with some modifications, on that of New York State. One modification involves Maryland's testing and grading of cytotechnologists as well as pathologists. Maryland also has developed improved diagnostic terminology and an improved examination form, as depicted in Figure 1.

Proposed regulations specific for this PT program were recently published in the *Maryland Register*.[5] A pilot PT cycle is being conducted through June 1989 for all cytopathology labs in Maryland. This first PT cycle will test sets containing ten cervicovaginal test slides. The pilot cycle will not assess PT fees, and test results will not become part of a lab's regulatory record. This initial cycle is intended to allow the Department to try out its testing methods and to obtain the cooperation and help of the state's cytopathology labs in implementing a fair and effective program.

A regular testing cycle complete with PT fees and mandatory retesting and retraining for those failing the test is scheduled for fall 1989. Annual cycles are envisioned unless cycle length and/or limited resources force biennial testing. Test sets containing several medicals (slides of body fluids) will be introduced in the fall of 1991.

All positive test slides used in Maryland's regular PT cycles are obtained from individual Maryland clinicians or laboratories and are evaluated by a panel of expert Maryland pathologists using the same technical criteria proposed by Penner[6] and implemented by New York State.[7] All negative test slides are limited to those that have been correctly diagnosed by 15 (94 percent) of 16 pathologists.[8]

A PT score of <90 percent, based on graded scores of 10, 5, or 0 points for each of ten slides, is considered a failure and unsatisfactory performance. Individuals failing the first test in a regular PT cycle will be subject to additional testing and possibly other restrictions as shown in Figure 2.

Fees to cover the cost of the PT program will be assessed on a sliding scale based on an examination fee of $250 per lab, plus $50 per cytotechnologist examined, plus $0.02 per gynecologic slide examined during the previous calendar year. The average annual cost of the PT programs over its first five years will be around $60,000. Included in the cost is money for computer software that will automate the grading of proficiency tests and compiling of program statistics.

CARAFATE®
(sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS
There are no known contraindications to the use of sucralfate.

PRECAUTIONS
Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS
Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE
There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION
The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED
CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088- 1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other. Issued 1/87

CAFAD276 0160N8

Carafate® for the ulcer-prone NSAID patient

Aspirin and other nonsteroidal anti-inflammatory drugs weaken mucosal defenses, which may lead NSAID users to become prone to duodenal ulcers.[1] For those NSAID users who do develop duodenal ulcers, CARAFATE® (sucralfate/Marion) is ideal first-line therapy. Carafate rebuilds mucosal defenses through a unique, nonsystemic mode of action. Carafate enhances the body's natural healing ability while it protects damaged mucosa from further injury. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate: therapy for the ulcer-prone patient.

Unique, nonsystemic

CARAFATE®
sucralfate/Marion

Assistant Professor of Surgery, UCLA School of Medicine and Drew University of Medicine and Science, Los Angeles

Associate Surgeon, Department of Cardiovascular & Thoracic Surgery, Centinela Hospital Medical Center, Los Angeles

Major, U.S. Army Reserve

EDUCATION Rensselaer Polytechnic Institute, Troy, NY, B.S. Chemistry; NYU School of Medicine, New York, M.D.

RESIDENCY Boston University School of Medicine (Cardiovascular); Saint Vincent's and St. Claire's Hospitals, New York City (General Surgery)

FELLOWSHIP First Mary A. Fraley Cardiovascular Surgical Research Fellow at the Texas Heart Institute, Houston

OUTSTANDING ACHIEVEMENTS Author of numerous articles, including "Indications for Early Bypass Grafting Following Intracoronary Streptokinase"; author of "The Female Surgeon—Dawn of a New Era," chapter in *A Century of Black Surgeons—The U.S.A. Experience;* Board of Directors, Association of Black Cardiologists; Secretary, Drew Society

"The caliber of physicians you meet in the Army Reserve exposes you to new ways of looking at a problem. It's easy for young surgeons to become entrenched in one method, but in the Army Reserve you'll have the chance to work with outstanding physicians in your own specialty, and often learn new ideas that will help you to improve your own approach to clinical or research problems," says Dr. Sterling-Scott.

The Army Reserve can offer physicians a variety of challenging options such as teaching, research, unique training programs, and the opportunity to practice in prestigious Army medical centers.

"Joining the Army Reserve enabled me to take advantage of a number of conferences, including one at Walter Reed, where I worked with thoracic surgical colleagues, while conducting my own research project."

We understand the time demands on a busy physician. So the Army Reserve offers training programs that will allow you to be flexible about the time you serve.

For more information about specific programs, call toll-free 1-800-USA-ARMY.

ARMY RESERVE MEDICINE. BE ALL YOU CAN BE.

Prehospital Care and the Community Hospital as a Base Station

DAN K. MORHAIM MD, FACEP

In Maryland's coordinated, regionalized emergency medical system, prehospital care is given to an injured or ill person at home, on the street, or in a doctor's office before the patient is transported to a hospital. Prehospital care of patients has advanced significantly since the federal government passed emergency medical service (EMS) legislation in 1966. In Maryland there are several functioning levels of prehospital care providers who perform skills unique to their particular environment and training. It is reasonable for all hospitals operating a full-service Emergency Department to consider becoming base stations for consultation to prehospital care providers bringing patients to that hospital. This is well within the province of the Emergency Medicine specialist and will provide improved service to patients.

Prehospital care is given by emergency medical technicians-ambulance (EMT-As), cardiac rescue technicians (CRTs), emergency medical technicians-paramedic (EMT-Ps), and aviation trauma technicians (ATTs). Many critical decisions are made in the prehospital phase, and all physicians, nurses and community hospitals should be aware of this important aspect in the continuation of health care delivery. Community hospitals, through an organized and involved emergency medicine department, can take an active role in prehospital care by applying for base station status. As a base station, the hospital's emergency department physicians provide medical advice to prehospital providers.

History of Prehospital Care

The modern history of prehospital care can be divided into several phases. Since World War II, prehospital care has moved beyond the basic tasks of providing simple bandaging and transportation for the wounded. The use of triage, field stabilization, and rapid transport led to reductions in morbidity and mortality.

The Highway Safety Act (Public Law 89-564 passed in 1966) was an important milestone in addressing the needs of trauma victims before their arrival at a medical facility. Earlier studies had documented that at least 20 percent of deaths occurring at the scene of motor vehicle accidents resulted from reversible conditions. Thus, the Department of Transportation and the Federal Communication Commission began to set guidelines for the care of trauma victims and to establish programs for training prehospital care providers and for communications between prehospital care providers and physicians.

States were mandated to develop plans for emergency medical services (EMS). Nationwide programs were funded that trained literally thousands of paramedics and emergency medical technicians. Modern concepts of cardiopulmonary resuscitation (CPR) were developed as knowledge of the pathophysiology of cardiac arrest increased and were incorporated into Advanced Life Support programs.

The American College of Emergency Physicians (founded in 1968) began to establish standards affecting the practice of emergency medicine. In addition to the standards that had been set for the treatment of trauma cases, guidelines were formulated for the treatment of medical and pediatric emergencies.

After passage of the Emergency Medical Services Systems (EMSS) Act (Public Law 93-154) in 1973, a nationwide emergency medical care system was created. Components of EMS systems were identified, and areas of geographic responsibility were delineated. Financing was arranged through federal matching-fund grants.

Popularized in the media and made accessible through 911 phone systems, EMS systems currently render a significant portion of health care in the United States. For example, in Maryland, which has a population of 4.5 million, approximately 380,000 ambulance runs are made each year. Furthermore, it has become increasingly apparent that the care a patient receives in the first few minutes or hours of an illness or injury will greatly affect the ultimate outcome.

Prehospital Providers

Prehospital care providers are certified for Basic Life Support by the Maryland Institute for Emergency Medical Services Systems (MIEMSS) and by the Maryland Board of Medical Examiners for Advanced Life Support. They may be volunteer or career/paid and usually are affiliated with a fire department or governmental agency.

EMT-As are taught primarily to "do no further harm to patients, to perform basic stabilization, and to transport patients." Training consists of approximately 110 hours of course work. Skills include basic cardiopulmonary resuscitation, splinting, hemorrhage control, immobilization and extrication of patients at the scene, and treatment of medical emergencies. Additional training modules on the use of esophageal obturator airways and military antishock trousers (MAST) are available to EMT-As.

Dr. Morhaim is Chairman of the Department of Emergency Medicine at Franklin Square Hospital in Baltimore, on staff of the Emergency Departments at Homewood Hospital South and Carroll County General Hospital, and the Medical Director for the Maryland Institute of Emergency Medical Services System, Region III. **Reprints:** Dr. Morhaim, Department of Emergency Medicine, Franklin Square Hospital, 9000 Franklin Square Dr., Baltimore, MD 21237.

In addition to EMT-A skills, the CRT can administer a wide variety of medications. A minimum of 160 hours of course work above the EMT-A level is required.

ATT's skills are applied during helicopter transportation. ATTs function essentially as CRTs, but can provide some additional services required by their unique mode of patient transportation. However, CRTs and ATTs cannot provide synchronized cardioversion, endotracheal intubation, or removal of airway foreign bodies with McGill forceps. These are performed by the highest level of provider, the EMT-P.

To achieve the EMT-P level in Maryland the paramedic is required to have at least 300 hours of training beyond that of a basic EMT-A. Additional skills include full advanced life support activities, including intravenous and parenteral drug therapy, cardioversion, defibrillation, removal of foreign bodies in the airway by McGill forceps, cardiac monitoring, and endotracheal intubation. There is considerable variation among local jurisdictions as to how and when these and other skills are used. Paramedics in several Maryland counties began to perform endotracheal intubation in cardiac arrest patients in mid-1986.

Drugs available to paramedics generally include oxygen, lidocaine, epinephrine, atropine, sodium bicarbonate, naloxone (Narcan), nitroglycerine, morphine, furosemide, dopamine, terbutaline, bretylium, diazepam, ipecac, D50W, and IV solutions of dextrose in water and Ringer's lactate.

In addition, prehospital care providers employ some special skills and devices unique to their trade. These personnel must be skilled in the safe physical removal of patients from the scene of an accident (referred to as extrication). These efforts are coordinated with fire, police, or other rescue services. To extricate patients requires not only the mechanical removal of the patient but also the immobilization of the neck and spine with collars and backboards and of fractures with splints. Sometimes more sophisticated care, including IVs and drugs,is given to patients while still trapped.

The MAST device referred to earlier is an air-inflatable garment with components for both the legs and the lower abdomen. After the garment is placed around the patient, which takes only 30 seconds to one minute, it is inflated to compress the legs and lower abdomen. Antishock trousers are used to treat hypotension, to splint and stabilize fractures of the pelvis and lower extremities, and to modify and control suspected intra-abdominal bleeding (posttraumatic, leaking aneurysm, or ruptured ectopic pregnancy) through external compression. External counterpressure acts as a lower body immobilizer, a tamponade vehicle for internal hemorrhage, a nonsurgical external fixator for pelvic fractures, and a nonsurgical abdominal aortic clamp for support of coronary circulation when needed. It is used in the field to rapidly immobilize and stabilize patients for transportation to an emergency facility.

Prehospital care personnel also use mechanical cardiopulmonary resuscitation devices. Although a variety of mechanical cardiopulmonary devices exist, the brand name THUMPER best describes these devices. Driven by compressed air/oxygen, the machines deliver regular chest compressions through a rocker arm; they also can provide positive-pressure oxygen delivery. Mechanical cardiopulmonary devices seem to work at least as well as human-driven chest compression. Furthermore, their use avoids operator fatigue and frees the provider to attend to the patient's other needs.

Medical Direction

In all EMS systems, medical direction from a medical director is required. The medical director is responsible for clinical and patient care aspects of the system. Advanced life support (ALS) prehospital care provided by nonphysicians is considered to be an extension of the medical license of the medical director.

The responsibilities of the medical director can be separated into on-line and off-line functions. On-line control refers to communication between prehospital care providers and physicians at base station hospitals. The physician "controls" or advises prehospital care providers in the specific clinical management of individual patients. Protocols determine when prehospital care providers are required to contact a base station (Table 1). In general, this occurs when patients are sick, when specific clinical advice is required, or when the prehospital care providers believe the hospital should be notified in order to be well prepared to receive the patient.

Off-line functions include, but are not limited to education, protocol development, and quality review. The medical director also should have the authority to interact with other components of the EMS systems and to discipline or limit the activities of those who deviate from the established standards of care.

Base Station

As more hospitals in Maryland staff their emergency departments with emergency medicine specialist physicians and nurses, community hospitals are taking an increasingly active role in prehospital care (Table 2). In a community hospital serving as a base station, emergency physicians provide consultation to care providers bringing patients to that particular hospital. The advantages include:

- Teamwork and communication between the prehospital care providers and the physician and nursing staff from the hospital are promoted.
- The physician and nursing staff are familiar with the patient on arrival.
- Skills and experience in the management of patients in the prehospital care phase are developed.
- Quality review of care in the field is more easily achieved.

Disadvantages can be:

- Time demands on staff to set up base station.
- Time demands to manage a case when the Emergency Department staff is overloaded.

Typically, a base station consists of a console unit in a central area of the Emergency Department (Figure 1). The console permits two-way communication with providers in the field and radio telemetry transmissions of rhythm strips (Figure 2). It is helpful to have a notebook at the console to describe guidelines of field care as a reminder for the physician. Brief notes are taken about the patient and the care given; these notes are discarded after the ambulance arrives, unless a significant issue is raised. In Maryland, tapes of all calls are kept for two weeks so they are available if needed for quality review. Although it is not difficult for a community hospital to serve as a base station, it requires commitment on the part of the hospital and the emergency department staff, with support from other members of the medical staff and hospital administration. The following specific guidelines (developed between 1986 and 1987 by Regional Medical Directors and MIEMSS) must be met by a community hospital before it is designated as a base station:

1. As a consultation medical facility, the hospital will provide physicians familiar with Advanced Cardiac Life Support (ACLS) guidelines 24 hours a day, 7 days a week. The physicians must be available to start the consultation within two minutes of first notification.

2. Physicians should complete a base station course. The purpose of the course is to familiarize the physician staff with the use and operation of base station radio equipment as well as with the Maryland prehospital care protocols.

3. The physician should gain exposure to care rendered in the prehospital phase by participating in a "ride along" program with an advanced life support unit. There is

Table 1 .

Sample of Paramedic Protocol

3. SUSPECTED MYOCARDIAL INFARCTION

3.1 All patients with symptoms of chest pain which may be attributable to a cardiac cause:
- 3.1.1 Perform initial patient assessment.
- 3.1.2 Assign treatment priority based upon assessment.
- 3.1.3 Administer 50-100% oxygen, except patients with diagnosed COPD, then 24% oxygen at appropriate liter flow pending medical direction.
- 3.1.4 Start IV of 5% dextrose in water to keep vein open (20-30 mL/hr).
- 3.1.5 Connect to cardiac monitor and obtain rhythm strip, if possible.
- 3.1.6 Establish communications with hospital.
- 3.1.7 Stabilize cardiac status per order of physician (see lidocaine and atropine regimens below).

3.2 The lidocaine regimen may be instituted on the ALS unit by the CRT/EMT-P when physician consultation cannot be immediately obtained via the established EMS communication system and when the patient's condition meets criteria below. *CRT/EMT-P must have a paper tracing of the dysrhythmia before the regimen is instituted.* The lidocaine regimen may be instituted:
- 3.2.1 When the patient's ECG records PVCs that are:
  - a. Frequent (6 or more/min).
  - b. Multifocal.
  - c. Sequential.
  - d. Near "T" wave.
- 3.2.2 When the patient, conscious or unconscious, displays ventricular tachycardia, i.e., three (3) or more PVCs in a row.
- 3.2.3 When the patient displays sustained, ventricular tachycardia with pulse.
- 3.2.4 Following successful conversion from ventricular tachycardia or ventricular fibrillation.

Lidocaine regimen
—1.0 mg/kg IV bolus
—An additional 0.5 mg/kg IV bolus should be given every *ten* (10) minutes after the initial bolus if ventricular ectopy is still present, to a total dose not to exceed 225 mg.

3.3 The atropine regimen may be instituted when physician consultation cannot be obtained via the established EMS communication system and when the patient's ECG records sinus bradycardia or junctional rhythms with the following criteria. *CRT/EMT-P must have a paper tracing of the dysrhythmia before the regimen is instituted.*
- 3.3.1 Heart rate less than 60 bpm with systolic BP less than 80 mm Hg or patient exhibits signs/symptoms of shock.
- 3.3.2 Heart rate less than 50 bpm.
- 3.3.3 Varying degrees of second- and third-degree AV blocks (Mobitz I and II).
- 3.3.4 Second-degree AV blocks (Mobitz I and II) that are hemodynamically significant.
- 3.3.5 High-grade AV blocks.
- 3.3.6 Third-degree AV blocks.
- 3.3.7 Ventricular escape complexes.

Atropine regimen
—0.5 mg IV: may be repeated at five (5)-minute intervals until the desired rate and/or BP is achieved (rate, 60; BP, greater than 80 mm Hg). The total dose should not exceed 2.0 mg IV.

NOTE: *Documentation of the dysrhythmia must be obtained by the CRT/EMT-P prior to institution of either regimen and each administration of a drug.*

- Suburban Hospital Association
- Shady Grove Adventist Hospital
- St. Mary's Hospital
- Physician's Memorial Hospital

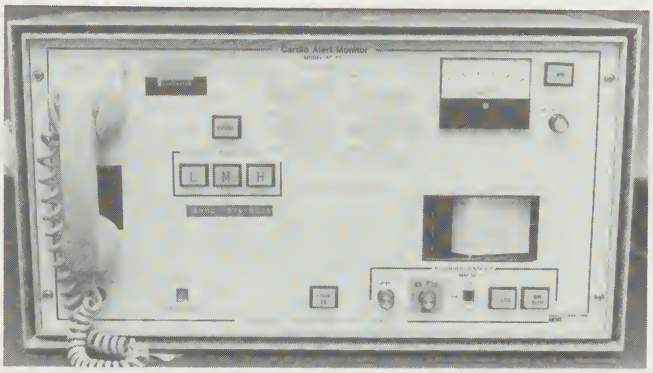

Figure 1. Typical base station unit found in the hospital and used by the on-line physician. This unit can receive a paper strip of the patient's cardiac rhythm in the field.

Figure 2. Paramedic consulting base station physician from ambulance unit.

no faster or better way for a physician to develop appreciation for the difficulties and challenges of prehospital care than to ride with field personnel for several busy shifts.

4. The hospital base station must be willing to be used on an "if-and-when" basis as a backup to the existing cardiac consultation centers. This entails consultations with prehospital care providers who would not be bringing the patients to that hospital, and it would occur when the other consultation centers are overloaded with calls.

5. The hospital will permit MIEMSS to conduct unannounced site visits to determine whether key elements are being met.

Unique Aspects of Base Station Operation

From the physician's point of view, the operation of a base station requires new skills. Physicians are accustomed to evaluating patients in person, and emergency physicians are adept at making rapid and thorough diagnostic and therapeutic decisions. However, in the operation of a base station, all information comes from the prehospital care provider's voice over the radio control box; thus, different "senses" are required for patient assessment. Physicians with experience in prehospital care evolve certain basic skills to enhance communication. Among these are avoiding jargon, speaking slowly and clearly, asking questions if uncertain, informing the field if communications are poor, and asking the opinion of the field provider.

Special Problems

Physician on the Scene Problems may occur when field personnel must provide care in a physician's office or when a physician is on the scene. The field provider may be caught between following protocols (under the direction of the base station physician) and following orders from the physician on the scene.

Physicians inexperienced in acute care medicine sometimes offer their services. Worse, some bystanders masquerade as knowledgeable health care providers. Paramedics usually resolve these problems by requesting positive identification before accepting a "physician's" help by having the physician on the scene talk to the base station physician and by requiring the physician on the scene to accompany the ambulance to the hospital if that physician wishes to continue treating the patient (Figure 3).

Consent and Liability Prehospital care providers frequently deal with situations in which consent and liability may become issues. How does one deal with a minor if no adult is present, especially if that minor is a large, 17-year-old, intoxicated male who does not want

to be treated? What does one do when a patient refuses to accept any treatment? What if a patient later feels the care was poor or inappropriate? Such treatment dilemmas occur daily.

Patients with Terminal Illness Hospice patients and patients with "living wills" raise complex issues. In general, prehospital care providers do not wish to be only a transportation service; private ambulance services exist to fill that need. Frequently, however, providers are confronted with terminal patients whose families may request discontinuance of CPR.

Other unusual situations may arise. There have been cases in which paramedics were told that the patient had cancer, only to discover this referred to skin cancer. In one anecdotal case, a family member did not want a potentially salvageable patient to be resuscitated; later it was disclosed that an inheritance was at stake.

Resolution of these problems is difficult even for a physician in a hospital or office setting. Therefore, paramedics usually will continue resuscitation and follow protocol until the patient reaches the hospital. According to most living will legislation, CPR should be administered until the patient reaches a hospital and a physician. Currently, hospice physicians and staff are working with the Regional Medical Directors and prehospital providers to develop guidelines for care of hospice patients.

Future Issues

As emergency medicine becomes more sophisticated, the role of the paramedic will continue to grow. Paramedics are gaining recognition as allied health professionals, much like respiratory therapists or x-ray technicians. The increasing complexity of prehospital care will encourage career practitioners.

Physician:

In order to ensure continuity of care for your patient, please provide the following information to our medical control physician:

1. A brief medical history of your patient
2. The patient's present illness and chief complaint
3. Current medications
4. Findings of the physical examination

At the completion of this information, please return the card and the radio to the paramedic on the scene.

Figure 3. Reproduction of a card the paramedic gives to a physician on the scene to assist in communications with the base station.

Traditionally, many prehospital care providers have received their training in the firehouse. Recently, however, community colleges have begun offering paramedic training.

Questions remain as to what constitutes the best care in the field. How much should paramedics do? How should new drugs and techniques be integrated into prehospital care medicine? How should prehospital care providers be trained?

Emergency medicine health planners will soon recognize that urban areas with short transport times generally have the highest number of career paramedics, while rural areas with long transport times sometimes have less experienced personnel. In general, areas with longer transport times (30 minutes or more) should provide the highest level of service. Correcting the imbalance between the quality of care offered in areas of long and short transport time will require complex financial and political solutions.

Conclusion

It is reasonable for all hospitals operating a full-service Emergency Department to consider becoming Base Stations for consultation to prehospital care providers bringing patients to that hospital. This is well within the province of the Emergency Medicine specialist and will provide improved service to patients.

Methodologic Approach for a Large Functional Trauma Registry

C. MICHAEL DUNHAM MD, R ADAMS COWLEY MD, DAVID R. GENS MD, AMEEN I. RAMZY MD, AURELIO RODRIGUEZ MD, HOWARD BELZBERG MD, and CHARLES E. WILES III, MD

The utility of a clinical trauma registry (TR) is directly related to the constituents of the data base and to the accuracy of the data, which is contingent on a carefully constructed data collection system. A TR was developed by traumatologists at a busy Level I trauma facility that predominantly receives patients having incurred blunt injury. Four dedicated data collectors gather the AP information within 24 to 48 hours after admission, with prompt Attending Surgical review for verification. Examples of data output prove this is a functional system. Using a careful methodologic approach for design and implementation, clinicians can create a large, functional trauma registry with many potential applications.

A multiply injured patient needs specialized care to survive.[1,2] Many advances have been made in recent years to meet the critical needs of traumatically injured patients. Prehospital treatment and transportation modalities provide early stabilization of life-threatening injuries and transport to a medical facility, where the appropriate personnel and equipment for the provision of definitive medical care await the patient's arrival. Continued enhancement of these medical capabilities, resulting in further reductions in morbidity and mortality, requires careful assessment of protocols as well as calculation of needs based on long-term experience. A source of data for such analyses is a clinical trauma registry (TR).[3-5]

Traumatologists at the Shock Trauma Center of the Maryland Institute for Emergency Medical Services Systems (MIEMSS) have designed, implemented, and begun to evaluate a TR, a data collection and analysis system that incorporates descriptions of injuries, physiologic/metabolic alterations, and hospital interventions. The purpose of the TR is twofold: (1) to develop an accurate trauma patient profile by collecting and storing *clinically significant* data that can be analyzed to assess and define critical variables affecting patient survival and morbidity and (2) to provide a measure for trauma patient care relative to medical, nursing, and auxiliary support.

Various methodologic considerations culminated in the design and implementation of this clinical TR. The result of the process is a comprehensive, large-volume data base that can generate reliable reports on issues of clinical concern. The system has built-in flexibility to accommodate changing patient-care patterns and decisions regarding the scope of the registry.

The TR produces an easily accessed data base that has multiple uses. It is intended to enhance the study of the etiologic characteristics of trauma, for example, the incidence of injuries and types of accidents. The TR should help clinicians assess the quality of health care delivery, that is, to define its assets and deficits by delineating the case mix (types and severity of injury) and assessing patient outcome (mortality, morbidity, and length of stay [LOS]). Difficult management areas will be identified with data from the registry; research then can be directed toward understanding the problems and developing appropriate solutions. Evaluation of medical/nursing/auxiliary support services is possible using reports from the registry. Necessary services can be defined, and the associated financial factors (including reimbursements) can be delineated subsequently.

The Emergency Medical Services System in Maryland is an integrated network of prehospital care providers, communications and transportation systems, and medical facilities.[6] Upon arrival at the scene of an incident, field personnel rapidly assess the patient's injuries, institute life-saving interventions, and begin transport procedures. Critically ill and injured patients are transported by Maryland State Police Med-Evac helicopter or by ambulance to the most appropriate medical facility. Admission usually occurs within the "Golden Hour," the hour after injury, during which medical intervention must begin if the patient is to survive.[7] The patient population at the MIEMSS Shock Trauma Center therefore can be summarized as a well-defined group of patients with:

1. similar admission criteria (triaged to a Level I trauma center and predominantly experiencing blunt trauma)
2. similar treatment patterns performed by the same group of care-givers (traumatologists and intensivists)
3. sufficient detailed information to form an accurate and significant data base.

Data Constituents

Data had to be selected to create a pool of information of workable size without jeopardizing its reliability. Too

From the Shock Trauma Center of the Maryland Institute for Emergency Medical Services Systems, Baltimore. **Reprints:** C. Michael Dunham MD, Department of Surgery, MIEMSS, 22 S. Greene St., Baltimore, Maryland 21201-1595.

much or irrelevant data would produce an unmanageable quantity of material to be captured and analyzed reliably, while too little information would leave major gaps in the data base.

While realizing that assessment and procedures from the prehospital and rehabilitation phases are important, we focussed on the first 24 hours after admission; the gravity of a trauma patient's injuries cannot be appreciated fully until the end of that period. As the system evolved, the data base was expanded to include information on procedures and assessments performed during the patient's time in the hospital until discharge. These two constituents of the registry are the Admission Profile and the Hospital Course, respectively.

Trauma patients can be grouped into one or more of six basic categories: shock or cardiovascular instability, respiratory insufficiency, brain injury, spinal cord injury, other significant anatomic injury, or minor injury. These groups dictated the choice of information defining the registry's perspective: (1) the degree of physiologic and anatomic disruption caused by an injury and (2) the treatment instituted. The following elements were selected:

1. demographic characteristics (to define the patient population)
2. etiologic characteristics of the accident/injury
3. selected prehospital assessment/interventions
4. assessment of injury severity/case mix (physiologic/anatomic)
5. initial treatment (resuscitation/surgery)
6. complications (anatomic/physiologic/infectious)
7. outcome (mortality/LOS/brain and extremity function)

Admission Profile

These data relate primarily to the first 24 hours of hospitalization; some information gleaned from the prehospital field reports also is included. The Admission Profile consists of the subgroups listed below.

Demographic Profile Information for this category, largely from the prehospital phase, includes patient characteristics and incident history. Among other items, the demographic profile sheet records the date and time of injury, the mechanism of injury, the time of departure from the scene, and the date and time of admission.

Premorbid Illness Profile This category primarily describes common chronic systemic diseases that could affect the efficacy of therapeutic interventions, increase the severity of the traumatic insult, or dictate patient management.

Cardiovascular Profile This profile supplies prehospital and admission subsets of information. A preinjury history of hypertension, cardiac medications, and/or myocardial infarction is recorded. The prehospital subset supplies at-the-scene heart rate, cardiac rhythm, and blood pressure information as to whether the rate was greater than 100 beats/min or the systolic blood pressure was less than 90 torr. The profile also indicates whether the patient had a cardiac arrest at the scene or in transport, had medical antishock trousers (MAST) applied, or received any fluids. The admission subset identifies admission heart rate, blood pressure, and whether the patient was in cardiac arrest.

Significant external hemorrhage and its location are noted; the admitting physician determines whether the hemorrhage constitutes a "major" blood loss (greater than 500 ml at the scene, in transport, and/or in the admitting area prior to control of the bleeding). This information provides a physiologic perspective to an injury. For example, a scalp laceration accompanied by insignificant bleeding may be unimportant; however, for a patient admitted in shock, a scalp laceration may be the primary source of significant hemorrhage. Most registries indicate only the presence or absence of such an injury; the significance of an anatomic disruption to the patient's overall condition is not always implicit without a physiologic perspective.

This profile also documents the amount of blood lost during a specified operative procedure within the first 24 hours. In addition to intraoperative blood loss, external blood loss via drains is measured to provide a more complete picture of the magnitude of hemorrhage.

Another component of the cardiovascular profile is the amount and type of fluids administered during resuscitative procedures: colloid, crystalloid, packed red cells (banked blood), autotransfused blood, fresh frozen plasma, and platelets. Note is also made during the first 24 hours of any cardiovascular medications the patient may have received and of urinary output.

Respiratory Profile The respiratory profile records admission respiratory rate and airway status: natural airway, esophageal obturator airway, translaryngeal tube, or transtracheal tube. The presence of airway obstruction or cyanosis is noted as are the results of arterial blood gas analysis. The time of tracheal intubation relative to admission is indicated.

Central Nervous System Profile Combining the patient's Glasgow Coma Scale (GCS)[8] score (physiologic/functional perspective of brain function) with his/her computed tomography (CT) scan (anatomic information) creates a relatively comprehensive picture of brain injury. Spinal cord function is described in terms of normal, incomplete deficit, or

complete deficit for each of its three levels: cervical, thoracic, and lumbar.

Anatomic Registry The anatomic registry subdivides major body areas (head, neck, thorax, abdomen-pelvis-perineum, extremities, and spine) into injury categories. Each body region is further subdivided; for example, the head category consists of brain injury, facial fractures, skull fractures, and soft tissue injuries. These subcategories are then further delineated as to the exact location or type of injury; these subdescriptors were selected, according to experience at the Shock Trauma Center, as likely to provide clinically significant information.

Postmortem Review Autopsy information, when available, is provided by the Maryland Medical Examiner's Office. Anatomic injuries are then entered into the anatomic injury section of that patient's data sheet. Therefore, the information on every trauma patient who expires, whether immediately on admission or weeks later, is as complete as possible.

Hospital Course

Since the LOS varies greatly between trauma patients and since much (or little) can happen during that stay, the original scope of the registry (the Admission Profile) was expanded to include major hospital events (infectious and anatomic complications, systems failure, and operative/nonoperative procedures).

Complications This category records systems failure, infectious complications, and anatomic complications, regardless of whether they occur iatrogenically or as sequelae to original injuries (Table 1). Strict definitive criteria have been established for each subdivision within these three groups, which heightens the degree of uniformity of data collection.

The list of systems failure covers multiple metabolic and physiologic parameters that are associated with significant stress or instability. Those items are further divided into subgroups for delineation of processes such as hypotension (mean arterial pressure <60 torr), hypernatremia (serum sodium >160 mEq/liter), oliguria (urine output <60 ml/2 hr), and hyperamylasemia (>200 IU/liter).

The criteria used to identify infectious complications are well delineated by the Infectious Disease Department.

Anatomic complications are listed according to obvious body structures; subgroups are listed under each division to capture events such as pulmonary embolism, soft tissue necrosis (delineated by body region), and pneumothorax.

Procedures This category documents the timing and types of all procedures, whether diagnostic or therapeutic, operative or nonoperative, for example, arteriogram, peritoneal lavage, central venous line insertion, hemodialysis, orthopedic surgery, and plastic surgery. Surgical procedures are delineated according to the Current Procedural Terminology (CPT "codes") adopted by the American Medical Association.

LOS The total amount of time a patient spends in the Shock Trauma Center is documented in this category. That figure is subdivided into time spent in each care unit; the order in which those substays occurred also is recorded. For example, a patient may spend six hours in the admitting area, be sent to the Critical Care Recovery Unit (CCRU), and three days later be transferred to the Intensive Care Unit (ICU). After four days, the patient may develop complications necessitating a return to the CCRU. Seven days later, the patient may again be transferred to the ICU and subsequently to the step-down intermediate care unit for nine days.

Discharge Status The survival/nonsurvival status of each patient is documented. This record shows when and to what facility/location a surviving patient is discharged: home, rehabilitation center, nursing home, or other destination. For each patient who dies, it notes when and where within the facility the death occurred. This category was selected for the evaluation of specific care areas as well as that of patient condition and hospital course.

Data Collection

Admission Profile To help ensure the validity and reliability of the information in the data base, strict definitions were established for the data to be collected and a small collector group was identified. The data had to be easy to capture; otherwise, the recorders would not collect the same information consistently for all patients with the same degree of dependability.

Table 1. Complications within the Hospital Course

Systems Failure		
Neurologic	Respiratory	Hematopoetic
Renal	Gastrointestinal	Extremities
Cardiovascular	Hepatic	Metabolic
Infectious Complications		
Abdominal	Empyema	Sinusitis
Arterial line	Lung abscess	Tracheo-bronchitis
Bacteremia	Osteomyelitis	Urinary tract
Central nervous system	Phlebitis	Soft tissue
Cholecystitis	Pneumonia	
Anatomic Complications		
Neurologic	Respiratory	Soft tissue
Urogenital	Gastrointestinal	
Cardiovascular	Spleen	

Third-level groups are indicated on the data entry form to enhance the specificity of documentation.

Four dedicated data collectors are responsible for reviewing each patient's care chart and listing appropriate values and descriptors within 24 to 48 hours after admission. Within 48 to 72 hours after the data forms have been completed, each of the four trauma team attending surgeons reviews and verifies the entries for his patients. Because the surgeon is involved in the data verification process soon after the patient's admission, he has clear memory of the details of the assessment and treatment procedures and has had time to discover pathologic processes that the patient may not have exhibited at admission. Thus, the physician has the opportunity to medically validate the data entry forms, supply information obtained during the first few days after admission, and otherwise "fine tune" the clinical picture of the patient as indicated on the data form.

Hospital Course The same four data collectors who gather information for the Admission Profile also retrieve certain data for the Hospital Course. They review the patients' hospital charts *daily* until discharge; extract specific, identified information (diagnostic and therapeutic operative and nonoperative procedures); and assign predetermined codes. While the patient is in the Neurotrauma Acute Care Unit or the CCRU, the critical care attending physician provides additional data: he/she completes forms on a daily basis to validate information (GCS, spinal cord function, myocardial infarction) that requires expert assessment. When the patient progresses to the step-down units, the trauma surgical attending completes these forms on a weekly basis until the patient is discharged. Certain data that lie within a range arbitrarily identified as abnormal, such as a serum sodium value $>$ 160 mEq/liter or a cardiac index $<$3.0 liter/min/m^2, are harvested from computer-stored data that have been collected each day as part of the patient's routine care.

Data Processing

Data Entry Information collected from patients' charts and reviewed by the attending medical staff is added to the TR data base via an IBM PC/AT by a dedicated entry person via a system of compiled dBase and SAS®screens. The personal computer (PC) has a 70-megabyte (MB) hard drive, 640-kilobyte RAM (random access memory), and a 1.2-MB floppy drive.

The data-entry person is knowledgeable about the TR constituents and is able to spot inconsistencies and determine if data are missing; questions about these data items are discussed with the data collectors. Numerous quality control checks are performed to ensure accuracy of entry. Records are reviewed that have an illogical response, for example, an "abnormal CT scan" is marked "yes" or the summary page reveals that there is a "thoracic injury," yet there is no entry in the respective injury sections.

Data entry screens designed for the TR show acceptable ranges for clinical and laboratory values (for example, admission pH level) and provide a means for immediate audit by the data entry person. The program also alerts the operator to inconsistent and incomplete entries within a record.

Data Output Data are transferred from the entry system onto a 1.2-MB high-density floppy disk and onto the hard disk of the data output system. The output system is a Compaq Deskpro 386 PC running at 20 MHz CPU. The system has a 300-MB hard drive, 1-MB RAM, 1.2-MB floppy drive, and a 35-MB Compaq tape backup system. The primary software is PC/SAS®, customized to enhance ease of data base access and file management. The SAS®software supports the storage and retrieval of data, data modification and programming, report writing, statistical analysis, and file handling. Some programming must be performed by the attending medical staff, which permits optimal manipulation of the data base.

The data are evaluated by a series of queries/checks to identify data collection and entry errors, for example, frequency distributions of data fields are compared over "adjacent" time periods and assessed when there is a significant variation. The data base is modified/updated to enhance accuracy.

Sample Results

Currently, the TR includes the Admission Profile for 9,193 trauma patients admitted to the MIEMSS Shock Trauma Center between July 1983 and June 1988. The Hospital Course contains data sets for 6,560 of the patients admitted between February 1985 and June 1988.

Table 2 shows the categorization of injuries sustained by 5,390 trauma patients: 87.2 percent had blunt traumatic injuries (only 0.6 percent had combination blunt/penetrating injuries), including 3,252 craniofacial injuries. Of the 5,390 patients, 76.0 percent were admitted directly from the accident scene and 71.5 percent were transported by helicopter.

Tables 3 and 4 display the airway status and neurologic profile for the same patients. More than 90 percent had no airway obstruction and were breathing via their natural airway on admission, yet 40 percent required intubation during the initial 24 hours after admission. Over 18 percent had GCS values of $\leq$12 ; 44.1 percent of all patients required CT scans, 40.2 percent of which were abnormal.

A sample study group consisting of 1,058 patients admitted between July 1983 and June 1984 was chosen; this homogenous population had the characteristics of

blunt trauma injuries, no cardiac arrest, and direct admission from the scene. The modified Trauma Score (TS),[9-11] the GCS,[8] and the Injury Severity Score (ISS)[12-14] values, and their respective mortality rates, are shown in Tables 5 through 7.

Using the Admission Profile data set for the sample study group, a stepwise multivariate logistic regression analysis was used to determine the subset that best related to mortality:

$$\text{probability of death} = 1/(1 + e^{y})$$

where $e = 2.718$, $y = 4.89 - 1.98(I) - 2.06(P) - 2.92(G3) - 1.56(G5) - 0.00003(A^2) - 0.0002(B) - 1.3(R)$. In this equation, I = inotrope (Y/N), P = pressor (Y/N), G3 = GCS 3-4 (Y/N), G5 = GCS 5-7 (Y/N), A = age, B = ml of blood administered in the first 24 hours, and R = admission respiratory rate $\leq$10/min (Y/N). A "yes" (Y) response was valued as 1; a "no" (N) response was valued as 0; $n = 1058$, $r^2 = 0.47$, $X^2 = 260.56$, and $p << 0.005$. The fitted regression accounted for 47 percent of the variation in the probability of death, while the ISS and modified TS accounted for 22 and 31 percent, respectively.

A comparison was made between the ISS values calculated from hospital discharge sheets and the TR-generated ISS values for patients admitted directly to the MIEMSS Shock Trauma Center and without cardiac arrest between July 1983 and June 1984. Only 13 percent of the scores were the same; 21.4 percent of the remaining scores differed by at least 10 ISS points.

Discussion

The MIEMSS Shock Trauma Center registry is an organized data system pertaining to a Level I trauma center. It was created in response to the need to gain a panoramic view of the effects of health care delivery within this medical facility. The uniqueness of the TR relates to the combination of its scope (encompassing the records of thousands of patients and numerous descriptors for each of those patients), accuracy, accessibility, and potential utility.

Throughout the design and implementation of the system, procedures that would ensure the dependability of the TR were adopted. By initally focusing on only the Admission Profile, we prevented inundation of the data collection and entry phases; when the mechanisms for this phase were in place the registry was expanded to include the patients' Hospital Course. Physician verification of collected data provides an obligatory means of quality assurance. Inherent checks of data

Table 2. Number of Injuries in 5,390 Patients* (July 1983 - June 1986)

Type	Number
Craniofacial	3,252
Extremities	2,223
Thorax	1,704
Spine	1,285
Abdomen, pelvis, and perineum	1,241
Neck	155

*1.83 body regions injured per patient.

Total *	1,058		71	

*Patient group: blunt injuries, direct admissions, no cardiac arrest on admission.

accuracy and completeness by the computer software also have been imposed on the system.

The data base was structured to provide answers to the following sample questions: What is the average GCS score at the time of discharge relative to the admission score at each level? What is the average LOS for various patient categories? What is the average length of time that certain patients are ventilated? What is the average number of infectious complications for specific types of patients? How many CT scans are required for certain brain-injured patients? Answers to those questions are now accessible.

Attributes of a large PC based data system are that it is readily available in a convenient location 24 hours a day and is relatively inexpensive. The AP and HC contain 1,623 and 1,485 variables in 6 and 20 files, respectively. The strategy is to maintain the current, evolving year and the previous three years of AP and HC data on a hard disk. This requires approximately 200 MB of space on the hard disk, which will permit access to current patient records and easy use of data, spanning more than 6,000 trauma patients at any time. The 300-MB hard disk will permit moderate expansion; however, due to the magnitude of the data base, an additional microcomputer or work station may be necessary in the next couple of years to accommodate the accumlating data and to maintain an acceptable processing speed. The results are output by the medical staff who have been trained to use the relatively simple programs. This is ideal, since the people who best understand the clinical problems and the constituents of the registry can optimally use the data base.

The TR will serve multiple purposes. It will supply valuable information in hopes of developing predictors of trauma patient outcome. The data base should help indicate expected developments in the patient's response to injury and necessary care requirements: if a facility does not have the necessary equipment or experienced personnel to provide the care a particular trauma patient will need, it should consider transferring that patient to a facility that meets those requirements. The TR should provide a documented evaluation of the existing trauma system and the effectiveness and appropriateness of its care, so that plans and protocols can be altered accordingly. Analyses will be undertaken to determine the medical, financial, and auxillary support needed to manage various types of trauma patients.

Reports from the registry will help indicate specifications about the ancillary support and personnel needed by any medical facility contemplating the establishment of a Level I trauma service. For example, 44.1 percent of the patients admitted to the MIEMSS Shock Trauma Center require CT scans; of those patients, 40.2 percent show pathologic aberrations. These facts underlie the high-yield criteria used to determine the need for a CT scan; they also emphasize that a trauma facility needs to have CT scan services 24 hours per day. In addition, the data base will be used to provide an accurate means of establishing a diagnosis-related group (DRG) reimbursement system for the multiple trauma victim.

The trauma registry is a necessary data base tool for evaluating health care delivery for trauma victims.[3-5] Analyses of existing injury indices indicate that both physiologic and anatomic descriptors[9] should be included and that these descriptors must be defined *objectively* to produce a valid, accurate trauma patient profile to ensure foreknowledge of the equipment and personnel needed to supply appropriate and efficient patient care. Comparison of ISS values computed from hospital discharge sheets and the ISS values generated by the TR emphasize the absolute necessity for an objectively generated, well-structured data base to provide accurate predictions of trauma patient mortality and morbidity.

Several tools have been developed in attempts to describe and evaluate patients with severe multiple injuries, for example, the GCS,[8] the TS,[9-11] the ISS,[12-14] and the Abbreviated Injury Scale (AIS).[14] The intent of

Table 6. Glasgow Coma Scale Score and Mortality (July 1983 - June 1984)

each includes the stratification of patients relative to their injuries, with the goals of assessing health care systems and therefore improving and refining injury-specific patient care. An injury severity score needs to be fine tuned to predict mortality and morbidity (infectious/anatomic complications, systems failure, LOS) accurately. It has been questioned whether the ISS and TS systems meet the rigors of methodologic assessment relative to reproducibility and validity.[12]

When using a trauma scoring system, an individual's score may be affected by how well the injuries are described; a poor depiction may prevent a true assessment of the tool's validity. The discrepancy in ISS values generated from the TR compared with the hospital discharge data obtained via the International Classification of Diseases is multifactorial. A TR ISS value higher than the hospital discharge ISS value for the same patient was determined to be secondary to the former's more specific injury data of the TR. A TR ISS lower than the hospital discharge ISS value for the same patient was determined to be secondary to the latter's nebulous, multiple potential entries for a brain-injured patient, leading to excessively high ISS/AIS codes.

In the TR used at the MIEMSS Shock Trauma Center, every patient's injuries are classified specifically and minutely, leaving no "choices" as to category: if the patient has injury X, he/she is entered in a specific category X, and any other patient with injury X will also be entered in category X. Virtually all Admission Profile and Hospital Course data elements are likewise well delineated to enhance the development of an accurate data base.

Plans for the immediate future of the TR include the incorporation of additional prehospital information and expansion of the hospital course to the posthospital phase. To ensure validity of the equation used to determine the probability of death, a prospective assessment needs to be performed on another population. The addition of anatomic injury parameters may enhance the predictability of mortality. Future analyses will determine more definitively which of the currently collected data need not be collected and which need to be expanded, for example, adding cognitive function scores for assessing brain injury. Extensive analyses will be undertaken to evaluate AP and HC variables relative to their predictability of mortality and specific morbidities.

In any facility, the overall goal of a trauma registry is to develop a more efficient trauma care system, leading to cost-effective planning and utilization of personnel, skills, and equipment and ultimately to optimal social reintegration for the trauma victim.

Acknowledgments

The authors acknowledge the contribution of the following data collectors: Kathleen Kekich, Richelle Kennedy, Janet Farrell, Daniela Kantor, Kimberly Mitchell, Lynn Clapsaddle, and Roseanne Brown. Special thanks to Belavadi S. Shankar ScD; Richard Ross; Dariush Kochesfahani; and ORI, Inc., Computer Services Division, for computer systems support. The authors are indebted to Mark Moody PhD, for his contribution to the development of the Admission Profile, and to John Britten MD, for providing data input.

What is PDS?

PDS is a professional service company for physicians. PDS helps the physician obtain the best benefit for the disabled patient who is applying for Social Security Disability Insurance benefits or seeking vocational rehabilitation.

- **Team up with PDS** and help disabled patients get benefits sooner. You examine the patient, order tests, and furnish results to a nurse from our directory.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

MED PAY *Announces Insurance Processing Breakthrough*

"Physicians Receive Payment Today For Patients Seen Yesterday"

The **MED**ical **PAY**ment Services of Maryland, Inc. program has completely changed the way physicians receive their hard earned fees. The doctor turns over all insurance claims and patient billings for processing by **MED PAY. MED PAY** does all of the rest. In turn, the doctor receives payment today for patients seen yesterday. It really is just that simple.

We know that this may sound too good to be true. So let us prove to you how this unique program can make a dramatic difference to the physician, their practice, and their patients. To set up an appointment for more information, call **828-5050.**

MED PAY is cost effective — especially for smaller practices of 1–5 physicians

Use of Health and Rehabilitation Services Following Head Injury

ARLENE I. GREENSPAN PT, MPH; ELLEN J. MACKENZIE PhD; JAMES CHRISTENSEN MD; and CAROLE ROBEL BA

The impact on public health of head injury as a major source of death and disability, especially among adolescents and young adults, is well recognized. In Maryland the primary annual incidence of head injury severe enough to result in death or hospitalization has been estimated to be 149 per 100,000 population.[1] These figures are comparable to national and other regional estimates reported in the literature.[2-5] Improvements in the acute care management of head injury have generally led to improved survival.

The case fatality rate associated with head injury in 1986 is estimated in Maryland to be approximately 16 percent, resulting in 5,600 survivors of injury serious enough to require hospitalization. Of these survivors, estimates are that 72 percent, 17 percent, 9 percent, and 2 percent sustain minor, moderate, severe, and very severe injuries respectively.[1]

Both increased survival and improved recognition of posttrauma functional disability have added to the demand for rehabilitation services. Several studies have acknowledged the importance of rehabilitation as a factor in outcome from head injury,[6-8] yet little is known about the extent to which various services are being used or the factors that influence access to services and the level of use. To better address these issues in Maryland a "needs" survey was conducted to provide insight into current use for a population of adolescents and adults who reside in Maryland and have sustained a significant head injury.

Methods

Study Population The Maryland Head Injury Foundation (MHIF) needs-assessment survey was administered in 1986 to 74 head-injured adolescents and adults or their families, who were identified from the MHIF mailing list. Approximately 68 percent of the head-injured persons were 19 or older at the time of injury. The median time since injury was four years; 20 percent had been injured one year or less, 43 percent within two to five years, and 36 percent greater than five years. Head- injured patients made up 23 percent of the interviewees; the remainder were parents or other relatives. Although the sample may not be representative of the head-injured population in Maryland, it assisted the Foundation in learning the needs of their membership and in identifying underserved populations for outreach services.

Authors Greenspan and Mackenzie are with The Injury Prevention Center, The Johns Hopkins School of Hygiene and Public Health, Baltimore. Dr. Christensen is at the Department of Pediatric Rehabilitation, The John F. Kennedy Institute, and the Department of Pediatrics, The Johns Hopkins Hospital, Baltimore. Robel is with The Maryland Head Injury Foundation Catonsville, MD.

Supported in part by the Division of Maternal and Child Health of the Health Resources and Services Administration and the Centers for Disease Control.

Survey Instrument Interviews were conducted by volunteers of MHIF and covered a broad range of sociodemographic and injury characteristics with emphasis on describing head-injured patients' functional status at the time of the interview, the types of rehabilitation services individuals received following head injury, their perceived unmet need for services, and reasons for not obtaining those services.

Functional Status Three measures of functional status were used in this study: (1) self-assessed limitation in daily activities, (2) inability to engage in a productive role, and (3) need for a primary caregiver.

Activity limitations of the patient at the time of the interview were determined by asking whether the head-injured person currently had difficulty performing a series of activities considered normal for an adult in good physical health. Activity items were taken from a number of sources including the pretest of the Post-Census Disability Survey[9] and the National Long-term Care Survey.[10] They were chosen to represent the three major dimensions of physical function as defined in the literature: self-care, mobility, and physical capabilities.[11] Self-care included the five basic activities of daily living (ADL): feeding, bathing, dressing, toileting, and bed transfer. Mobility was determined using three items measuring the subject's ability to get around his or her home, the neighborhood, and the ability to use public transportation. Activities used to measure physical capabilities included walking a quarter of a mile, walking up and down stairs, and standing for long periods. For each of the above activities, respondents were asked whether the head-injured person had difficulty performing the activity. For purposes of summarizing functional status, study participants were regarded as limited in any of the categories if they had difficulty performing at least one activity in that area. Although activity limitations are primarily a result of impairment in physical function, cognition also plays a role in independent performance for most of the activities.

Individuals were classified as having a productive role at the time of the interview if they were engaged in full-time or part-time employment, enrolled in school or vocational training, or keeping house. Those who answered that the head-injured person was retired and on disability or engaged in some "other" activity were

counted as nonproductive. Most individuals who answered "other" reported that the head-injured individual spent most of the day at home not engaged in any particular activity.

Members of the study population were considered independent if interviewees responded that the head-injured person did not identify the need for a primary caregiver.

Use of Services Respondents were presented with a comprehensive list of rehabilitation and social services and asked about the use of each service by the head-injured person and his/her family. Services were classified into six broad categories: medical care, rehabilitation services, counseling or psychotherapy, educational and employment assistance, social services, and information and referral. For each service, respondents were asked whether the head injured had ever used, currently was using, or had needed but had not received the service. For services needed but not received, respondents were given a list of reasons and were asked to indicate one or more reasons for not obtaining those services.

Findings

As shown in Table 1, the majority of the head-injured individuals were male (68 percent), aged 19 to 35 years at time of interview (58 percent), and had never been married (66 percent). Although these characteristics are fairly typical of a head injured population,[2-5] educational attainment was higher than expected with more than 80 percent reporting either completion of high school or some college attendance and more than half the population reporting they had some college education. This is considerably higher than the findings of Mackenzie et al.[12] who surveyed trauma patients discharged from the Maryland Institute for Emergency Medical Service Systems (MIEMSS) shock trauma unit, the statewide specialty referral center for neurotrauma. Of the trauma patients surveyed from MIEMSS who had sustained head injury, 66 percent had completed high school or had some college and only 21 percent had some college education.

Respondents also reported high household incomes with 53 percent of the population reporting yearly family earnings of $20,000 or greater at the time of the interview and 28 percent reporting earnings of more than $40,000. High household earnings may reflect both the educational attainment of the family and the disability benefits received by the head-injured person.

At the time of interview only 22 percent of the head-injured individuals working (16 percent full-time and 5 percent part-time), compared to 46 percent who were working prior to injury (42 percent full-time and 3 percent part-time). However, if the data are disaggregated

by time interval since injury, the differences in employment decrease somewhat over time. Whereas none of the head injured had returned to work within one year of injury, 37 percent of those who had sustained a head injury six or more years prior to the interview had returned to work. At time of interview, 18 percent were enrolled in school and 4 percent were enrolled in a vocational training program (participation in both of these activities decreased with time since injury), whereas prior to injury 42 percent were enrolled in school. Moreover, at the time of interview close to 10 percent reported the head injured as retired and on disability and approximately 40 percent reported his or her usual activity as "other." This is compared to 5 percent who were retired or reported "other" as their usual activity prior to injury.

More than half (51 percent) the population reported having private insurance, 23 percent Medicare, 11 percent Medicaid, and 8 percent reported having no insurance. The proportion of head-injured persons having private insurance was greatest for those who had been recently injured, while those who had been injured more than five years ago were more likely to have Medicare. The proportion of head-injured subjects having no insurance decreased as time since injury increased. Social Security was the most common disability benefit received (38 percent), followed by welfare payments (14 percent). Head-injured persons were least likely to receive unemployment or workers compensation (5 percent).

Characteristics Related to Head Injury

Severity of head injury was determined by length of coma, as reported by the respondent (Table 2). The population surveyed was skewed toward the more severe range of head injury, with 27 percent reporting coma greater than six weeks and approximately 58 percent reporting coma from two days to six weeks. Only 15 percent of the population had been in coma less than or equal to 24 hours. Those injured during the previous year were somewhat less likely to have been in coma one day or less (7 percent) than those injured two or more years ago (17 percent). Those injured more than five years ago were most likely to have had a very severe head injury with 35 percent having been in coma more than six weeks, although these differences were not statistically significant.

The primary cause of injury was due to motor vehicle crashes (74 percent), with approximately 86 percent of those due to occupant injuries and the remainder due to pedestrian injuries. An additional 8 percent were due to falls, and 5 percent were due to assault. Close to half the injuries (47 percent) were not accompanied by secondary injuries or were accompanied by facial injuries only. The most common injury to occur with head injury was an extremity injury, with or without abdominal injuries (36 percent). In addition 12 percent sustained chest or internal injuries, and 7 percent sustained spine or back injuries.

Functional Status

Activity limitations, nonproductive role in society, and lack of independence were used to describe the functional status of the head injured patient at the time of the interview. Overall, 35 percent had limitations in at least one ADL, 42 percent reported at least one limitation in mobility, and 45 percent reported at least one limitation in physical capabilities (Table 3). Half the population was not engaged in a productive role at the time of the interview. Even individuals who had sustained trauma more than five years ago continued to report functional impairment with approximately one third reporting activity limitations and almost half not engaged in a productive role. This is in comparison to

Table 2. Distribution of Characteristics Related to the Head Injury by Interval since Injury

Length of Coma as Reported by Respondent	Time Interval (Years) Total (N=74) (percent)	≤1 (N=15) (percent)	2-5 (N=32) (percent)	>5 (N=27) (percent)

*Numbers in parentheses represent percent currently receiving services.

activity prior to head injury, in which only 11 percent of the head injured were reported as not engaged in a productive role.

Thirty-nine percent reported they were independent at the time of the interview. Forty-seven percent reported the primary caretaker to be a relative and of those, 77 percent were parents. The remaining 14 percent reported that a professional was the primary caretaker, further demonstrating that the MHIF population continued to display significant disability. This is echoed in terms of where the head-injured subjects were living at the time of interview. Close to half (46 percent) were living with their parents; 19 percent were living in a skilled-nursing home, extended-care facility, or group home; and only 35 percent were living in their own home. As expected, the proportion of head injured persons who were independent and living in their own home increased over time, so that while only 20 percent and 13 percent were independent and lived in their own home up to one year postinjury, these proportions increased to 41 percent and 52 percent, respectively, for those who had been injured more than five years ago.

Use of Rehabilitation and Social Services

As shown in Table 4, use of rehabilitation services was variable with some services demonstrating much higher use rates than others. A comparison of use of services by category revealed variation in the percent who used services among the six categories identified. Moreover, when categories were disaggregated by type of service, differences within groups also were observed. Services aimed toward maintaining individuals in the community or improving their integration into the community were less often used than services geared toward improving specific physical and mental deficits. Thus a larger proportion of head-injured patients had used medical services (84 percent), rehabilitation services (91 percent), and counseling (91 percent) than had used education and employment assistance (52 percent), social services (63 percent), and information and referral services (38 percent).

Examination of within-group differences revealed variation for all categories containing multiple services. Within the area of rehabilitation, study participants were more likely to have received services that focused on sensorimotor and perceptual skills such as physical therapy, occupational therapy, and speech therapy (84 percent, 71 percent, and 74 percent respectively) than services that focused on improving behavior or cognition. For example, only 65 percent reported that the head-injured patient had ever had cognitive therapy, 58

percent behavior therapy, and 43 percent training in social skills.

Receipt of counseling or psychotherapy likewise showed variation by type of service received. Whereas services aimed toward individual psychotherapy or counseling demonstrated high use (80 percent and 72 percent respectively), a much smaller proportion of the population had made use of support groups, group counseling and/or family counseling (47 percent, 40 percent, and 35 percent respectively).

When employment and educational services were examined by specific service, it was found that more patients had received educational or employment counseling (35 percent and 37 percent) than specific work training (24 percent) or placement in either paid employment (12 percent) or sheltered workshops (5 percent).

Finally, examination by type of service revealed that head-injured patients were least likely to have received social services. For example, only 10 percent had ever used respite care, 28 percent transportation services, and 10 percent house placement assistance. Similarly, relatively small percentage had ever used information and referral services (38 percent).

As expected, the proportion of head-injured subjects receiving services at the time of interview decreased as time interval since head injury increased. However, a surprisingly large proportion of individuals who had been injured more than five years prior to the interview reported that they were receiving individual counseling (41 percent) at the time of interview.

Unmet Need and Reasons for Not Obtaining Services

Respondents also were asked whether specific services were needed but had not been received (Table 5). Perceived unmet need varied considerably by specific type of service. For services used by a large proportion of the population, perceived unmet need was quite low. However this in part may have been due to the way the question was phrased. Only individuals who had not received services were asked whether they needed the service. We do not have a measure of whether more services might have been needed for those who reported they had received some services. For services that were less used, perceived need varied as well.

For many services, need was highest for those who had sustained head injury more than five years ago. For example, although no one who was injured within the previous year reported need for family counseling, 26 percent of individuals who had been injured more than five years ago reported need for family counseling. Unmet need was generally highest for information and referral services (30 percent) and specific social services including respite care (20 percent), transportation (12 percent), recreational services (14 percent), and house placement assistance (10 percent). Need was quite low for other social services including personal care attendant services (3 percent), homemaker services (4 percent), financial management (4 percent), and shopping (3 percent). This may be due to the small proportion of head-injured victims from this sample who were living independently.

For services aimed at educational and employment assistance, need was highest for assistance with placement in paid employment (12 percent) and work training (8 percent), and lowest for employment counseling (4 percent) and placement in sheltered workshops (4 percent).

By far the most common reason given for not obtain-

ing services was that the head-injured individual or family member did not know where to go to obtain the service (71 percent). In addition, 57 percent reported they were unaware the service was available, and 43 percent reported that no referral had been made. A much smaller proportion of respondents listed expense (25 percent), lack of seriousness of problem (20 percent), geographic accessibility (18 percent), eligibility (7 percent), difficulty in getting an appointment (7 percent), inability to get there (4 percent), or inconvenient office hours (4 percent) as reasons for not obtaining services.

Discussion

Although the generalizability of the findings is limited due to small sample size and the heterogeneity of the population with respect to age, severity, and length of time since injury, the findings provide some initial insights as to the current use of services by the head-injured population in Maryland and where gaps in service delivery may exist. The emphasis of this analysis is descriptive, pointing to patterns in use of services following head injury and perceived need for additional services. Survey results indicated that most of the head-injured population had received some rehabilitation services following injury. However several factors, including the high level of income and education of the population, the large proportion of individuals with severe head injury, and the fact that study participants were from the MHIF mailing list may have biased the results toward a higher level of service use and a lower level of unmet need than might be expected in a more representative population of head-injured persons.

Despite the high level of use of services overall, examination by type of service revealed gaps in both use and perceived need for services. Individuals were least likely to receive social services, educational/employment services, and information and referral services. These services tend to be needed once the head-injured person is living in the community and usually are not part of the initial phase of rehabilitation (for example, vocational training). This is in contrast to services which displaying high use rates such as medical, rehabilitation, and counseling services that are more typically initiated early during the acute care or rehabilitation process. However, even within specific groups of services that demonstrated high use rates, variation in use of service was observed. For example, physical, occupational, and speech therapy had been used by a much larger proportion of the population than were cognitive therapy, behavior therapy, or training in social skills. Yet many clinicians and researchers have noted that behavioral and cognitive deficits are more likely to limit function than are physical deficits.[13]

Individuals who had been injured more than five years ago were less likely to have received some services than those who had been injured more recently. Although in many cases these differences were not statistically significant, it does suggest that access to rehabilitation has improved in recent years. It also may indicate that individuals who had previously sustained head injury and did not receive services may still need specific services.

Need was greatest for information and referral services. Close to 30 percent reported they needed but had not received such services. This is further supported by the reasons respondents gave for not receiving services. Close to 75 percent of the population responded they did not know where to go to obtain needed services, and 57 percent reported they were unaware the service was available. Further outreach and better coordination in rehabilitation care is indicated.

Additional research is needed using a larger, more representative population to further examine variations in the use of rehabilitation services taking into account service intensity, matching need with service use, as well as the availability of specific services. More research also is needed to examine the influence and interaction among factors such as (1) the characteristics of the health care delivery system, (2) economic and personal resources of the family, and (3) demographic and injury characteristics of the head-injured population.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

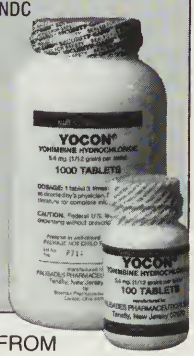
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Medical Care Behind Bars: Maryland Prison System

MARCEL E. SALIVE MD, MPH and T. FORDHAM BREWER MD, MPH

The inmate population in the Maryland prison system has increased dramatically over the past 10 years due to changes in sentencing by the courts. At the same time, costs of inmate health care have increased markedly following court cases mandating adequate care, an amelioration of prior inadequate standards of care. The unique demographic and disease risk characteristics of inmates predispose them to a distinct set of health problems. The state is legally obligated to provide health care to individuals sentenced to confinement in state prisons. It is often the first care these individuals have received in many years.

The degree of civilization in a society can be judged by entering its prisons. Dostoyevsky

The courts have long maintained the right of inmates to receive necessary medical care during incarceration. During the 1970s this right was extended through class-action suits, based on the eighth amendment to the Constitution, which protects against "cruel and unusual punishment."[1] Medical care systems prior that time are described as dismal,[2] and they changed very slowly in response to legal challenges.[3-4] We describe the medical challenges of inmate health and assess more recent changes in the Maryland prison health care system.

Inmate Characteristics

Persons convicted of a crime and sentenced to at least one year in prison are housed in the Maryland Division of Correction; those with lesser sentences usually are held in county jails. The number of inmates in the Maryland state prison system has increased 58 percent between 1979 and 1988, from 8,102 to 12,777. A large increase occurred between 1981 and 1984, with slow growth over the past four years (Table 1). In 1988, the inmate population was 96 percent male, 72 percent black, and 76 percent between ages 18 and 35. This is similar to the demographic breakdown of prisoners in the United States but obviously much different from the general population of Maryland.[5]

The average prison sentence of state inmates is 11.5 years, and inmates have served an average of 40 months. About half the entering inmates serve 18 months or less before release. There are over 20 various institutions, which can be classified by security level: pre-release, minimum, medium, and maximum. The majority of inmates are housed in medium security (69 percent), with nearly equal numbers in maximum (16 percent) and minimum/pre-release (15 percent) security. Two facilities, one for each sex, accept inmates from county jails. During the two-month intake process, the inmates are evaluated by medical and correctional personnel, prior to transfer to the other institutions.

Inmate Health Problems

Prison inmates are subject to a distinct set of medical problems deriving from two sources: the demographics of inmates and their risks factors prior to incarceration. Few medical problems are due to the prison environment itself. One of the most comprehensive studies of inmate medical problems involved 1,420 inmates entering New York City jails.[6] A physician made a diagnosis or noted a problem in 56 percent of the inmates; the most prevalent problems were drug abuse, psychiatric disorder, trauma, and alcohol abuse (Table 2).

Drug abuse is the most prevalent health problem. In the New York study, 33 percent of inmates had a history of heroin abuse, and 12 percent had been enrolled in a methadone program prior to incarceration. Overall, 41 percent of entering inmates reported drug use. A national survey of jail inmates demonstrated the close connection between incarceration and drug abuse.[7] This study found that 68 percent of local jail inmates had a past history of drug abuse, 44 percent within the month prior to incarceration, and 21 percent at the time of the offense for which they had been convicted. Maryland

inmates are quite similar to this profile; 37 percent of inmates entering the system in 1987 had a history of intravenous drug abuse (D.Vlahov, personal communication).

The sequelae of drug abuse are also common among inmates. Needle sharing can result in transmission of hepatitis B virus,[8-9] delta agent, and human immunodeficiency virus (HIV).[10-12] Bacterial endocarditis can occur among inmates. Because injection of illicit drugs occurs in prison, overdose deaths can occur. In short-term settings such as local jails, drug and alcohol withdrawal symptoms can present during incarceration.

The high prevalence of psychiatric disorders in inmates makes this one of the major needs for correctional health services. Some individuals contend that deinstitutionalization from state mental hospitals has been followed by an increase in the number of mentally ill inmates, however there is little data to support this. Crisis management increases the need for mental health personnel in correctional facilities. Chronic management of psychiatric illness also demands a large share of correctional resources. Prevention of suicide through treatment of psychiatric disorders is a high priority.

Inmates have been found to have a higher prevalence of seizure disorder than do the general population.[6,13] While the cause of this relationship is unclear, the goal of treatment is clear: to prevent potential problems from seizures during lock-down.

Tuberculosis is a great concern of correctional health personnel because of the potential for institutional spread.[14-15] Most prison systems test incoming inmates for reactivity to purified protein derivative (PPD) and use chemoprophylaxis to prevent potential problems. A more recent concern relating to AIDS is the finding that HIV infection potentiates the development of clinical tuberculosis in those infected with both the tubercle bacillus and HIV.[16] This new development requires rigorous adherence to chemoprevention to prevent institutional outbreaks.

Mortality

In the Maryland prison system, about 20 to 25 inmate deaths occur every year. Major causes of death include AIDS, suicide, homicide, and coronary heart disease.

Although AIDS is a concern of correctional officials, fewer than 20 cases of AIDS have been diagnosed in the Maryland prison system since 1984, when the first case was found. However, blinded epidemiologic studies have found that 7 percent of inmates entering the Maryland prison system are infected with HIV.[17] For inmates, intravenous drug use (IVDU) is the major risk factor for AIDS. Studies to evaluate transmission of HIV in prison, have documented that transmission does occur at low but measurable rates.[18] Consequently, prevention programs have been established to provide all incoming inmates with AIDS education, concentrating on modes of transmission and ways to avoid transmission. These programs were set up in 1985 by the Division of Correction through a contract with Health Educational Resource Organization (HERO). Efforts are continuing through the Maryland AIDS Administration.

Violent deaths occur more frequently among inmates than among the general population. Suicide has been described as the number one killer of jail inmates, though in state prisons it is less prevalent.[19-20] Many factors lead to suicide, including psychiatric disorders, despair, and substance abuse. Homicide can result from breaches of security. Inmates may injure or kill one another or be killed or injured by guards during escape attempts. Capital punishment has not been performed in Maryland since 1961, although it was re-instituted over 10 years ago on July 1, 1978.

Medical Care in Maryland Prisons

During the 1970s, great concern developed in this country about the health care delivered to jail and prison inmates. Numerous court cases, such as *Estelle v. Gamble* have addressed "the deliberate indifference to the serious medical needs of inmates." A national effort, funded by the Law Enforcement Assistance Administration, developed into first the American Medical Association (AMA) Minimum Health Care Standard

for Corrections, which eventually became the National Commission on Correctional Health Care Standards.

Maryland was involved in the early stages of these developments. However, the Division of Corrections later withdrew, after being instructed by the state legislature that Maryland would develop its own correctional health standards. This decision resulted in the convening of a task force in 1979, which culminated in the enactment of Article 31, Section 70C, in July 1980, establishing the Maryland Commission on Correctional Standards.

The Commission developed a set of standards and inspects correctional facilities for compliance with these standards, which emphasize the presence of policies and procedures, without much mention of quality, type, and availability of care. For example, the standards do not address dental care despite a legal basis for this requirement. The Commission lacks medical expertise, which adversely affects its function.

The presence of the Commission does not make the Maryland Division of Correction immune from legal actions regarding health care. The court generally uses the AMA standards as the benchmark and measures their achievement against the "community standard" (the level, type, and scope of health care available to the public in the free community). The general conflict between security considerations and health care standards is a major challenge to correctional health care providers.

Contract Health Care

The 1979 task force in Maryland also recommended the implementation of contractual delivery of all health care services. Until 1981, inmate health and mental health care needs in Maryland were provided principally by state employees, augmented by some contract employees, much like most other states. In 1981, the Division of Correction initiated its first comprehensive health care contract for the Baltimore region (which consists of the Maryland Reception, Diagnostic and Classification Center; the Maryland Penitentiary; and several pre-release units). In 1982, a contract was initiated for the Hagerstown region; in 1984 for the Jessup region; and in 1987 for the then-new Eastern Shore region. Currently, each region is contracted separately, although one company holds contracts for three regions.

Correctional health care administrators have described the driving forces behind a move to contract care as the need to control costs, to solve staffing problems, and to deal with potential court interventions. The latter, however, is illusory, in that the responsibility to assure inmate health care that meets with national and community standards still resides with the state, notwithstanding the presence of the contract.

The key benefit of contracting for health care is the improved ability to recruit and retain care providers through salaries and benefit packages that are not constrained by the state personnel requirements. In the face of the nursing shortage (correctional services are run by nursing services in many instances), the ability to offer highly competitive salary packages is a prerequisite to continued prison health care delivery.

Prison health care contracts provide comprehensive health and mental health care to each region. The contracts specify the basic nature and level of services to be provided, and include community hospitalization, inpatient infirmary and prison-based outpatient care, specialty clinics, "sick call," dental care, and inpatient mental health care. Outpatient mental health care is provided by state-employed psychologists. A central office in the Division of Correction Headquarters, the Office of Health Care Services, develops requests for proposals, awards, and monitors compliance with the contract as well as quality of care.

Financing Inmate Medical Care

During the many changes outlined above, the costs of inmate health care have risen substantially (Table 1). The cost of health care per inmate has risen from $405 to $1,074 between 1980 and 1986 (136 percent). During the same period, national health care costs increased by 68.2 percent. Costs in Table 1 do not include those for state employees, such as the state psychologists and the personnel in the Office of Health Care Services. When these figures were examined by a correctional management auditing firm in 1986, they concluded "Maryland's increased costs reflected a very minimal health care system prior to contracting." A comparison with national figures (average expenditure for health care of $1,200 per inmate in 1986), shows that Maryland provides inmate health care at below-average costs; however, the average encompasses a variety of community standards.

Inmate Medical Care

The structure of inmate medical care has parallels with traditional models of medical care as well as some contrasts. When an inmate enters the prison system, a screening history and physical examination are performed. Screening tests for tuberculosis, hepatitis, and syphilis are routinely obtained. Medical clearance is required to enter the general prison population.

Once in the general population, the inmate can access the medical system through "sick call," a common

prison-based system, whereby an inmate writes down his/her complaint and turns it in; an appointment with the medical staff is scheduled, usually for the following morning. Some triage by nurses and referral by physician assistants may occur during this process. In this way, the inmate has access to dental clinics and general medical clinics (hypertension, asthma, epilepsy,), as well as specialty clinics (optometry, neurology, urology, orthopedics, and otolaryngology). Regional infirmaries serve as the focal point for the delivery of medical services. Similarly, a regional mental health unit serves as the central point for the delivery of psychological and psychiatric services. Each region has an agreement with a nearby hospital for provision of needed inpatient care.

Conclusions

Tauxe and Patterson recently coined the term "desmoteric" as an adjective to describe medical conditions associated with imprisonment.[21] Consequently, "desmoteric medicine" may be used to refer to medical care provided in prisons. We have illustrated some unique aspects of desmoteric medicine, which make the case that it is a new subspecialty of medicine combining primary care, preventive medicine, administration, and quality assurance.

The major causes of morbidity and mortality in prison medicine are drug abuse, AIDS, suicide, trauma, violence, and injuries. Treatment and prevention are thus of paramount importance. Recent legal precedents portend continued growth in this field of specialization. Prison sentences are longer, and a larger proportion of society is entering the criminal justice system. These incarcerated individuals have a court-proved right to medical care held to a community based standard.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

AIDS as a Cause of Dementia in the Elderly

FRANK M. RYAN MD

Acquired Immune Deficiency Syndrome (AIDS) is frequently complicated by central nervous system (CNS) involvement. Progressive dementia is an increasingly recognized manifestation of AIDS-associated neurologic syndromes.

Mrs. A was a 76-year-old white female seen in January 1986 for evaluation of increasing confusion and dementia. A retired accountant, she continued to do tax preparation. She and the family noticed initial difficulty with calculation and a short-term memory deficit. She had fallen several times at home, but a CT scan performed as an outpatient revealed only some cerebral atrophy consistent with her age. Alzheimer's disease was thought to be the most likely diagnosis at this time.

Between January 1986 and June 1986 her mental decline accelerated rapidly. She developed increasing ataxia and incontinence. Her appetite was poor, and she experienced a 40 to 50 pound weight loss. Generalized alopecia developed. Thyroid functions and serum B12 level were normal. Physical examination was unremarkable during this period except for a broad-based gait. Deep tendon reflexes were 2+ and symmetrical. No pathological reflexes were noted.

The patient's past medical history was remarkable only for some mild essential hypertension managed with HCTZ 50 mg qd. She also had moderately advanced osteoarthritis that was managed with salicylates. There was a history of recurrent urinary tract infections. There was no history of recent travel. The patient had never received a blood transfusion. She was a widow whose husband had died of a non-Hodgkins lymphoma. He had undergone successful open heart surgery for coronary artery disease in 1979. There was no history of any sexual contacts after his death.

Following a fall at home, the patient was admitted to the hospital on June 22, 1986.

Physical Examination

The patient was a well-developed but chronically ill white female in no acute distress. Temperature - 99°F , BP - 130/78, P - 76, and regular R - 12.

Her pupils were equally round, reactive to light and accommodation. External ocular muscles were intact. Fundoscopic examination revealed flat disc margins. A:V ratio was 1:3. No hemorrhages or exudates were noted. Her canals were clear. Tympanic membranes were intact. She was edentulous. The neck was supple. Thyroid was not palpable. There was no palpable adenopathy. Chest was clear to percussion and auscultation. No cardiac murmurs, rubs, masses or gallops were noted. Abdomen was soft and nontender. No masses or organomegaly was noted. There was no peripheral edema. Pulses were intact in the upper and lower extremities. No carotid bruits were noted. The patient did exhibit Heberden's nodes at the distal interphalangeal joints of the hands bilaterally. Crepitations on range of motion were noted bilaterally in the knees. The patient was confused to time but oriented to person and place. Cranial nerves II-XII were intact, and no focal neurological signs or pathologic reflexes were noted. Deep tendon reflexes were mildly hyperreflexic without clonus.

Dr. Ryan practices in Fort Washington, MD.

Laboratory

Hematocrit was 37 percent with normochromic, normocytic indicies. WBC was 3,700. Differential showed 82 percent Segs., 3 percent Eos., 1 percent Baso., and 14 percent Lymphs. Initial chemical profile revealed an Alk Phosp of 310, SGOT 76, LDH 192, SGPT 33, and a Uric Acid of 4.0. Her EKG revealed only some nonspecific ST-T waves. UA showed TNTC WBCs. Subsequent urine culture grew more than 100,000 colonies of *Pseudomonas* species. Sed rate was extremely elevated at 128 mm/hr and remained in this range on repeat determinations.

Hospital Course

The cause of the patient's rapid mental decline was still unclear. A repeat CT scan was obtained because of the recent fall. No mass lesion or bleeding was noted. Cerebral atrophy with a questionable increase in ventricular size from the previous scan several months before was noted .

With the suggestion of increasing ventriculomegaly, a radionucleotide ventriculogram was performed. This revealed no activity over the convexities of the cerebrum at 48 hours and very little activity at 72 hours. It was thought the patient might have had a normopressure hydrocephalus. LP done at the time of the tap revealed 1 WBC and 72 RBCs. Cryptococcal antigen was negative. Protein and glucose were not obtained. A decision was made to perform a ventriculoperitoneal shunt, but the surgery had to be postponed because the patient had become febrile. The initial source of fever was believed to be her urinary tract. She had been treated with oral Geocillin, but when the fever developed she was switched to intravenous (IV) piperacillin and gentamicin. Repeat urine culture still showed infection

with greater than 100,000 col. of *E. coli*, which was sensitive to both of her IV antibiotics.

Additional evaluation of her GU tract was undertaken. A renal sonogram was remarkable only for a right peripelvic cyst in the kidney. CT scan of the abdomen was negative for perinephric abscess. PPD and mumps skin tests were both nonreactive. FANA and LE preps were negative. The patient's fever persisted with daily spikes to 103°F despite the IV antibiotics.

Chest X-ray showed the development of a hazy infiltrate in the left upper lobe. CT scan confirmed the infiltrate and showed adenopathy in the left hilar region. *Brucella* titer was negative. *Salmonella* titers were negative. Febrile agglutinins including Proteus OX-19 were negative at 1:80. Toxoplasmosis titer was negative at 1:16. Cytomegalovirus (CMV) titer was 1:57, with values in excess of 1.15 considered to be indicative of a high level of antibody. Because of the elevated CMV titer, an HTLV-III (HIV) titer was obtained. This was positive and was confirmed with a Western Blot test.

Because of the positive HIV titer, a closed lung biopsy was performed. Numerous cluster of *Pneumocystis carinii* were seen in the biopsy specimen. The patient was switched to IV septra. Her clinical course continued to decline. She developed generalized seizures just prior to her death on July 23, 1986. Autopsy and brain cultures through the NIH could not be arranged in a timely fashion and were not done.

Discussion

The diagnosis of AIDS was delayed because the patient clearly did not fit into any recognized risk group for this infection. The presumed route of infection was through her husband and his previous blood transfusion. By the time the diagnosis of AIDS was made, no accurate sexual history could be obtained. Her husband had been incontinent and had fallen on several occasions with lacerations just prior to his death in 1982, but neither of these facts are generally recognized as usual modes of transmission of the virus. There was no history of drug abuse or blood dyscrasias.

Her normopressure hydrocephalus presents an alternative explanation for the dementia that cannot be completely discounted. Radionucleotide scanning has not routinely been done in AIDS patients with dementia, and no findings of such scans could be found in the literature. Her overall clinical course with only a suggestion of increasing ventricular size, the rapidly progressive dementia over six months, her weight loss and alopecia, and her positive antibody for HIV and subsequent death from *P.carinii* argue strongly in favor of CNS involvement with HIV as the unifying cause for her condition. I believe the patient died as a result of the so-called AIDS dementia complex.

This case is unusual from a number of standpoints. A review of the literature makes it clear that AIDS in patients aged 65 and older is rare. Patchenik et al. described a 71-year-old previously healthy wife of a hemophiliac who developed recurrent thrush and onychomycosis one year prior to her husband's diagnosis of AIDS.[1] The wife subsequently developed *P. carinii* pneumonia and died. Her only apparent risk factor was infrequent monogamous sexual contact with her husband when he was asymptomatic.

> *The present case and that described by Patchenik make it clear that frequent sexual contact or a multiplicity of sexual partners are not necessary for transmission to occur and that the syndrome can occur in the elderly if they are exposed.*

Mirra et al. described a progressive dementia in a 57-year-old male that was originally diagnosed as Alzheimer's disease.[2] This patient presented with a personality change and forgetfulness that had been observed over a five-year period. The patient lost 44 pounds during the last 18 months of his life. He had impairment of recent memory and became increasingly incontinent. He developed frontal release signs. CT scan showed generalized atrophy. LP and laboratory data were normal. At the time of presentation the patient had no known risk factors for AIDS although subsequent information did reveal a history of bisexual activity. This information was not obtained until after his death.

At autopsy no neuritic plaques or neurofibrillary tangles (both hallmarks of Alzheimer's disease) were noted. Instead, involvement with multinucleated giant cells were noted in the brain and spinal cord, promoting further investigation for HIV. Integrated sequences for DNA specific to HIV were demonstrated. These findings were highly suggestive of HIV infection. Additional studies with two other specimens from patients with confirmed Alzheimer's disease failed to show any evidence for retrovirus infection. The authors point out (as in my case) the absence of clinically evident immunodeficiency is not helpful in excluding AIDS and that clinicians and pathologists should consider the diagnosis of AIDS even in older patients who are not known to be at risk for AIDS or AIDS-related complex (ARC).

The AIDS dementia complex has been reported as the presenting or sole manifestation of HIV infection. Navia and Price reported 29 patients at risk for AIDS

who presented with cognitive, motor, and behavioral dysfunctions characteristic of the AIDS Dementia Complex either preceding or in the absence of major systemic opportunistic infections or neoplasms.[3] Six of the patients were well or showed signs of ARC at the time of the diagnosis. Half the patients survived 6 to 15 months or died without showing other manifestations of AIDS. The patients showed mental slowing and impaired memory and concentration early in the course of their illness. Most deteriorated to the point of severe dementia. Behavioral changes were common; there was apathy, loss of spontaneity, and social withdrawal. Some developed agitated psychosis and hallucinations. Leg weakness, ataxia, and other motor signs (tremor and myoclonus) were seen eventually in almost all patients. CT scan showed cortical atrophy in 25 of 26 patients studied. EEG, when done, was uniformly abnormal. Cerebrospinal fluid (CSF) studies were abnormal in 13 of 15 cases with elevated proteins and a mononuclear pleocytosis in 4 patients. One of their patients, a 36 year-old female, began to exhibit personality changes 10 months prior to admission. There was no history of risk factors to AIDS except for a transfusion for excessive vaginal bleeding 14 months prior to admission, and that history was not obtained until after the diagnosis of AIDS was established.

Navia and Price emphasize that the AIDS dementia complex is the most common neurologic complication of AIDS, and that the dementia can be the first or only complication of HIV infection.

Shiach et al. reported a 47 year-old heterosexual male who had fever of unknown origin, diarrhea, and weight loss upon return to the United Kingdom after working in East Africa for many years.[4] The patient was febrile for a four-month period. His peripheral blood lymphocyte count was depressed and his Erythrocyte Sedimentation Rate was 137 mm/hr. T-cell markers were not done. All serological markers were negative except for CMV. Just prior to his death the patient developed focal neurologic deficits. At postmortem he was found to have a poorly differentiated lymphocytic lymphoma of the cerebrum, as well as toxoplasma cysts in both cerebral hemispheres. Lung abscess yielded *Klebsiella* and *Candida albicans.* Evidence of CMV infection also was found in the biliary tree, pancreas, thyroid, and lungs. The patient had no usual identifiable risk factors for AIDS.

The epidemiology of my case (as in the preceding case) was unusual. Clearly AIDS has been associated with blood transfusion. By 1985 the CDC had reported 18 instances of blood transfusion causing AIDS. The latency period may range from several months to 5 years, with a median latency between transfusion and the onset of illness of 27.5 months.[5] Women with a history of sexual partners with AIDS are also at risk. Up to 6 percent of AIDS patients have had no known risk factors, although in half these reported cases there is an inadequate case history.[6]

As mentioned, AIDS frequently involves the central nervous system. Levy found that 39 percent of 550 AIDS patients were neurologically symptomatic and that one-third were symptomatic at the time of the presentation.[7] This figure may even underrepresent the problem as an unselected autopsy series by this group at UCSF revealed that 73 percent (30 of 41 patients) had pathologic evidence of abnormalities in the CNS. Sloan-Kettering/New York Hospital reported that 50 of 162 patients had neurological manifestations of their disease.[8]

Ho et al. were able to recover HTLV-III virus from at least one specimin from 24 of 33 patients with ARC who had neurologic symptoms.[9] They concluded that the HTLV-III virus is neurotropic, capable of causing acute as well as chronic meningitis. Sixteen of their 45 patients suffered either an acute or chronic dementia. Several of their patients did not have clinical manifestations of immunodeficiency but did have neurologic symptoms. The virus was isolated from their CNS, suggesting that the neurologic disease may occur before or in the absence of immunodeficiency. Resnick found that 22 of 23 of his AIDS patients with neurologic symptoms were seropositive in their CSF for HIV. He described a 61-year-old transfusion recipient who had dementia and who died of *P. carinii pneumonia.*[10]

Shawn et al. reported on 15 cases of CNS AIDS in infants and adults.[11] They were able to detect the HIV virus by DNA marking in 5 cases. One of their patients was a 49 year-old female who developed seizures, ataxia, and dementia. Her only risk factor was a sexual contact with an ARC patient.

The neurologic manifestations of AIDS have been reviewed by Gabuzda and Hirsch.[12] The most frequent syndrome seen is a diffuse subacute encephalitis that causes neurologic dysfunction. This has alternatively been called AIDS encephalopathy, and the AIDS dementia complex.[13] Early in the course there is cognitive dysfunction and memory loss, as was the case in my patient. Nearly half the patients develop motor dysfunction, and behavioral changes are seen in 40 percent. The clinical course usually progresses over several months to one year. Mean survival from onset of the severe dementia was less than 2 months with a range of 1 to 6 months. Late signs include ataxia, incontinence, tremor, frontal release signs, seizures, and akinetic

mutism. Coma, on the other hand, was most often a sign of systemic illness.

This syndrome appeared in 35 of 128 patients in the UCSF study by Levy,[7] and in 54 of 320 patients they reviewed. CT scan generally showed critical atrophy. MRI scan appears to be more sensitive and has shown white matter signal abnormalities in addition to the atrophy. Lumbar puncture was abnormal in 75 percent of their series, with most having a mild hypoglycorrhacia and some demonstrating a mild pleocytosis. EEG has been nonspecific. The course they describe has been one of slow progression. No treatment has been deemed effective. CMV had been suggested as an etiologic agent as well, but Ho recovered HTLV-III from CNS culture in 10 of 16 patients with dementia. All were negative for cytomegalovirus.

In addition to the subacute encephalopathy, several other neurologic manifestations have been described. An aseptic meningitis including a flulike syndrome with fever and a rash have been reported at the time of seroconversion.[14] This may occur in 5 to 10 percent of the patients and represents primary HIV infection. Late in the course, varicella zoster may cause an aseptic meningitis, but HIV appears to be the most common cause of both acute and chronic aseptic meningitis. The AIDS virus has been shown to be related to the lentivirus subfamily of retroviruses. This group has been shown to cause neurologic disease in other hosts, so the prediliction of HIV for the CNS should not be surprising.

A vacuolar myelopathy occurs in approximately 15 percent of patients with AIDS. There is a strong association of dementia in this condition. The lateral and posterior columns are involved predominantly: patients frequently have ataxia, leg weakness, upper motor neuron signs, incontinence, and posterior column deficits.[15]

Peripheral neuropathies (especially a chronic distal sensory polyneuropathy) have been reported. An acute demylenating polyneuropathy resembling Guillain-Barre syndrome also has been described.[16]

Progressive multifocal leukoencephalopathy was originally described by Astrom and colleagues in 1958 as a complication of defects in cell-mediated immunity. It is now seen almost exclusively in AIDS patients. Berger and associates recently described 12 cases and reviewed the literature.[17] They estimate that 3.8 percent of AIDS patients have this disorder. It was the presenting complaint in 8 of their patients. Limb weakness and gait abnormalities as well as visual loss and altered mental status were the most common presenting complaints. CT scan showed hypodense nonenhancing lesions, and MRI was even more specific for the diagnosis. EEG and CSF were not helpful in distinguishing this illness. They demonstrated impaired cellular immunity even in the absence of other immunodeficiency associated illnesses. In their experience no treatment was effective.

Nonviral illnesses in the CNS have been caused by toxoplasmosis, *C. neoformans, C. albicans,* a variety of mycobacteria, syphilis, aspergillus, coccidiodomycosis, and *E.coli*. CNS neoplasms have included CNS lymphoma as well as systemic lymphoma with CNS metatases and metastatic Kaposi's sarcoma.

With the ever-increasing number of persons infected with HIV, the clinician must be prepared to diagnose and treat AIDS in those who are outside the usual risk groups. Undetected AIDS should be added to the list of causes of dementia, even in the elderly.

191st ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

April 12-14, 1989

Turf Valley Hotel and Country Club, Ellicott City, Maryland

WEDNESDAY, APRIL 12, 1989

2:00 p.m.

Plenary Session - *Congressman Tom McMillen*

4:00 - 5:30 p.m.

"**AIDS: How It Will Affect Your Practice**" - *Richard S. Schulof,* M.D.,Ph.D., Hematologist, Oncologist, George Washington University Medical Center, Washington, D.C., and *Edward Kirk,* M.S., Epidemiologist.

Sponsored by the Med Chi Committee On Aids and the Center for Health Education, Inc.

"**Overview of Gynecologic Oncology**" - *Joseph Buscema,* M.D., Assistant Professor, Obstetrics and Gynecology, Johns Hopkins, and Chief, Gynecology and Gynecology Oncology, St. Agnes Hospital, Baltimore.

Sponsored by the Obstetrical and Gynecological Society of Maryland.

"**The Psychiatric and Medical Problems of the Homeless**" - *William R. Breakey,* M.D., Associate Professor of Psychiatry, Johns Hopkins Hospital and *John A. Talbott,* M.D., Professor and Chairman, Department of Psychiatry, University of Maryland School of Medicine, Baltimore.

Sponsored by the Med Chi Committee on Mental Health and the Maryland Psychiatric Society.

"**Imaging Update For The Practicing Pediatrician**" - *Eglal Shalaby-Rana,* M.D., Instructor, Department of Radiology, Johns Hopkins Hospital and *Amy Yale-Loehr,* M.D., Assistant Professor, Department of Radiology, University of Maryland Hospital, Baltimore.

Sponsored by the Maryland Chapter, American Academy of Pediatrics and the Maryland Radiological Society.

"**Caring for the Industrial Back Pain Patient: The Roles of Myofascial Pain and Manipulation**" - *Stephen M. Levin,* M.D., F.A.C.S., Director, Potomac Back Center, Alexandria, Virginia and *Norman B. Rosen,* M.D., F.A.A.P.M.R, Medical Director, Rehabilitation and Pain Management Associates, Baltimore.

Sponsored by the Med Chi Occupational Health Committee.

THURSDAY, APRIL 13, 1989

7:15 a.m.- PRAYER BREAKFAST

"**Medical Ethics - Code or No**" - *Anne Neale,* Ph.D., Bon Secours Health System, Columbia, Md..

Sponsored by the Med Chi Committee on Medicine and Religion.

8:45 a.m. - 12:15 p.m.

"**Heart Disease 1989: New Technologies And Techniques**" - Moderator, *Frank Claudy,* M.D.
"**Lasers And Heart Disease**" - *Stuart F. Seides,* M.D., FACP, FACC
Additional topics and speakers to be announced.

Sponsored by the American Heart Association, Maryland Affiliate, Inc.

8:45 a.m.

"**The Caring Physician: Back To Basic Issues**" - *Spence Meighan,* M.D., Consultant To Hospitals and Medical Staffs, Portland, Oregon.

Sponsored by Medical Mutual Liability Insurance Society of Maryland.

"**Caring With Or Without Narcotics**" - *Speaker(s) to be announced.*

Sponsored by the Med Chi Committee On Drugs.

"**Physician Assistants**" - *Speaker(s) to be announced.*

Sponsored by the Maryland Academy of Physician Assistants.

"**Medicare Fraud And Abuse**" - *Speaker(s) to be announced.*

10:45 a.m.

"The Long Term Management of the Chronic Obstructive Pulmonary Disease (COPD) Patient" - *Lewis J. Rubin,* M.D., Head, Pulmonary Division, University of Maryland School of Medicine, Baltimore.
"Pulmonary Rehabilition" - *Edward W. Schaefer,* M.D., Chief, Pulmonary Medicine, Liberty Medical Center and *Bernard Farrell,* M.D., President, Medical Staff, Howard County General Hospital, Columbia, Md..

Sponsored by the Maryland Thoracic Society.

"Breast Reconstruction" - *John Bostwick, III,* M.D., Professor of Surgery, Division of Plastic Surgery, Emory University School of Medicine, Atlanta.

Sponsored by the John Staige Davis Society of Plastic Surgeons of Maryland.

"Treating The Musicians Among Your Patients" - *Richard Lederman,* M.D., Ph.D., Director, Medical Center For Performing Artists, Cleveland Clinic Foundation, Cleveland.

Sponsored by the Med Chi Music Medicine Clearinghouse.

"The Pen Is Mightier Than The Sword - Prescription Drug Abuse" - *Nelson H. Hendler,* M.D., Clinical Director, Mensana Clinic, Stevenson, Md..

Sponsored by the Med Chi Committee On Alcoholism and Clinical Dependency, Maryland Academy of Family Physicians, and the Maryland Psychiatric Society.

"The Primary Care Physician's Role In The Management Of Acute Coronary Disease" - *Henry Meilman,* M.D., Union Memorial Hospital, Balto. and *Carl L. Tommaso,* M.D., University of Maryland, Baltimore.

Sponsored by the Maryland Academy of Family Physicians.

2:00 p.m.

"Cardiopulmonary Resuscitation - Every Patient's Right - Or Exercise in Futility?" - *Rev. Robin Whitlock,* Baltimore, *Peter E. Dans,* M.D., Baltimore, and *Michael Ryan,* Esq., Baltimore.

Sponsored by the Med Chi Professinal Ethics Committee and the Committee On Medicine and Religion.

"Lipid Measurement Issues for Clinicians" - *Gerald Cooper,* M.D., Ph.D., Research Medical Officer, Division of Environmental Health and Injury Control, Centers for Disease Control, Atlanta and *Jack DeBoy,* Ph.D., Chief, Division of Laboratory Licensure and Training, Maryland Department of Health and Mental Hygiene, Baltimore.

Sponsored by the Maryland Commission on High Blood Pressure and Related Cardiovascular Risk Factors.

"Long Term Outcome And Management Of Chronic Urticaria" - *Gary Rachelefsky,* M.D., Clinical Professor Of Pediatrics, UCLA Medical Center, Los Angeles.

Sponsored by the Maryland Asthma And Allergy Society.

"What To Do With The Opposite Breast" - *Elmer Hoffman,* M.D., Baltimore, *Edward Lewison*, M.D., Baltimore and *John Bostwick, III* M.D., Professor of Surgery, Division of Plastic Surgery, Emory University School of Medicine, Atlanta.

Sponsored by the Maryland Breast Society.

"Physician Quality Assurance Board" - *Speaker(s) to be announced.*

4:00 p.m.

"Are Arterial Blood Gases Obsolete: Reflections On The Evolution Of Patient Monitoring" - *John W. Severinghaus,* M.D., Professor of Anesthesiology, Anesthesia Research Center, San Francisco.

Sponsored by the Maryland Society of Anesthesiologists and the Baltimore Critical Care Society.

"Pain And Performance - Musculoskeletal And Neurologic Problems In The Performing Arts" - *Yasoma Challenor,* M.D., Professor, Department of Rehabilitation Medicine, Columbia University, New York.

Sponsored by the Maryland Society of Physical and Rehabilitation Medicine.

"Clinical Application Of 201 Thallium (STECT) Imaging In Myocardial Disease"-*Jamshid Maddhi,* M.D., Associate Professor of Medicine, UCLA School of Medicine and Director of Nuclear Cardiology Research, Cedars-Sinai Medical Center, Los Angeles.

Sponsored by the Maryland Society of Nuclear Medicine.

"Stroke In The Young" - *Robert G. Hart*, M.D., M.P.H.,

Sponsored by the American Heart Association, Maryland Affiliate, Inc., Research, Medical and Community Programs Department.

"Clinical Application Of 201 Thallium (STECT) Imaging In Myocardial Disease" - *Jamshid Maddahi,* M.D., Associate Professor of Medicine, UCLA School Of Medicine and Director Of Nuclear Cardiology Research, Cedars-Sinai Medical Center, Los Angeles.

Sponsored by the Maryland Society Of Nuclear Medicine.

"Ethical Concerns On The Care Of The Elderly" - *Speaker(s) to be announced.*

Sponsored by the Med Chi Long Term Care And Geriatrics Committee.

FRIDAY, APRIL 14, 1989

8:45 a.m. - 12:15 p.m.

"ICU Management: A Cooperative Effort" - *Rhonda Fishel,* M.D.,Assistant Surgeon-In Chief, Sinai Hospital, Baltimore.

"Update On Cataract Surgery" - *Charles Castoro,* M.D., Private Practice, Baltimore.

Additional topics and speakers to be announced.

Sponsored by the Maryland Chapter of the American College Of Surgeons.

8:45 a.m.

"Clinical Diagnosis Of Alzheimer's Disease And Other Dementias" - *Speaker(s) to be announced.*

Sponsored by the Alzheimer's Association, Baltimore Central Maryland Chapter.

Topic and speaker(s) to be announced.

Sponsored by the Med Chi Committee On Small Area Variation.

"Reanimation of the Paralyzed Face Without the Facial Nerve" - *Mark May,* M.D., F.A.C.S., Clinical Professor, Department of Otolaryngology Head and Neck Surgery, University of Pittsburgh School of Medicine.

Sponsored by the Maryland Society of Otolaryngology Head and Neck Surgery.

"Next Button Please - A Glimpse At Computer Assisted Teaching Techniques For the 1990s" - *H. G. Oster,* M.D., Baltimore and *Darrell Rigel,* M.D., Clinical Assistant Professor of Dermatology, New York University Medical Center, New York.

Sponsored by the Med Chi Continuing Medical Education Review Committee.

"Emergency Medicine: Character Of An Evolving Specialty" - *Robert K. Anzinger,* M.D., F.A.C.E.P., Riverforest, Illinois, President-Elect, American College of Emergency Physicians.

Sponsored by the Maryland Chapter, American College of Emergency Physicians.

10:45 a.m.

"Coping With Stress In The Physician's Family" - *Penelope Ziegler,* M.D., Medical Director, Bethany Center, Bethany , Pennsylvania.

Sponsored by the Med Chi Committee On Physician Rehabilitation.

"Photophoresis and T Cell Lymphomas" - *Richard L. Edelson,* M.D., Professor and Chairman, Department of Dermatology, Yale University School of Medicine.

Sponsored by the Maryland Dermatologic Society.

"AIDS, Ethics, The Duty To Warn And Refusal To Treat" - Moderator, *W. Bradley King,* M.D. *Gillian Van Blerk,* M.D., Director, AIDS Administration, *John M. Henderson,* M.D., Forensic Psychiatrist, Baltimore, *Alfred L. Scanlan, Jr.,* Esq. and *Bernard A. Cook,* Esq., Levan, Schimel, Richman and Belman, Columbia.

Sponsored by the Howard County Medical Society.

"Ophthalmological Problems Common To All Physicians" - *George Weinstein,* M.D., Professor and Chairman, Department of Ophthalmology, West Virginia University, Morgantown, West Virginia, and *Allan Jensen,* M.D., Chief of Ophthalmology, Union Memorial Hospital, Baltimore.

When your patients need your best health care recommendations use your head.

Remember this hat.

When your patients need home health care remember to recommend Staff Builders. Our nurses (RN/LPN), therapists (physical/occupational/speech), medical social workers, nurses aides, home health/personal care aides, home-makers, live-in home companions are all carefully screened, bonded, insured and professional in every way. But more than that, they care. So remember Staff Builders when you recommend health care services. And remember most home health services are paid by Medicare, Medical Assistance, or Blue Cross. And that hospital and home private duty services are also available. Staff Builders personal and professional care is as close as your phone. Just give us a call if we can be of assistance.

Licensed by the State of Maryland and Federally Certified for Medicare/Medical Assistance/Blue Cross-Home Care.

Available every hour 7 days a week.

Baltimore City	752-0062/625-0222

NOTICE TO AUTHORS:
Floppies Requested

When submitting manuscripts for review by *MMJ's* Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request *MMJ* will return your disk after your article is published or if your manuscript is not accepted.

YOUR ROCHE REPRESENTATIVE WOULD LIKE YOU TO HAVE SOMETHING THAT WILL ...

ROCHE®

... improve patient satisfaction with office visits.

... improve patient compliance with your instructions.

... reduce follow-up calls to clarify instructions.

Roche product booklets ...

- offer a supplement to, not a substitute for, patient contact.
- support your specific instructions to the patient.
- provide a long-term reinforcement of your oral counseling.
- are available in *Spanish*.

Because you are the primary source of medical information for your patients, we invite you to look over the Roche product booklets shown below. Ask your Roche representative for the new catalog brochure of patient education materials and for a complimentary supply of those booklets applicable to your practice.

ROCHE MEDICATION ME EDUCATION

Working today for a healthier tomorrow

COMMITTED TO EXCELLENCE

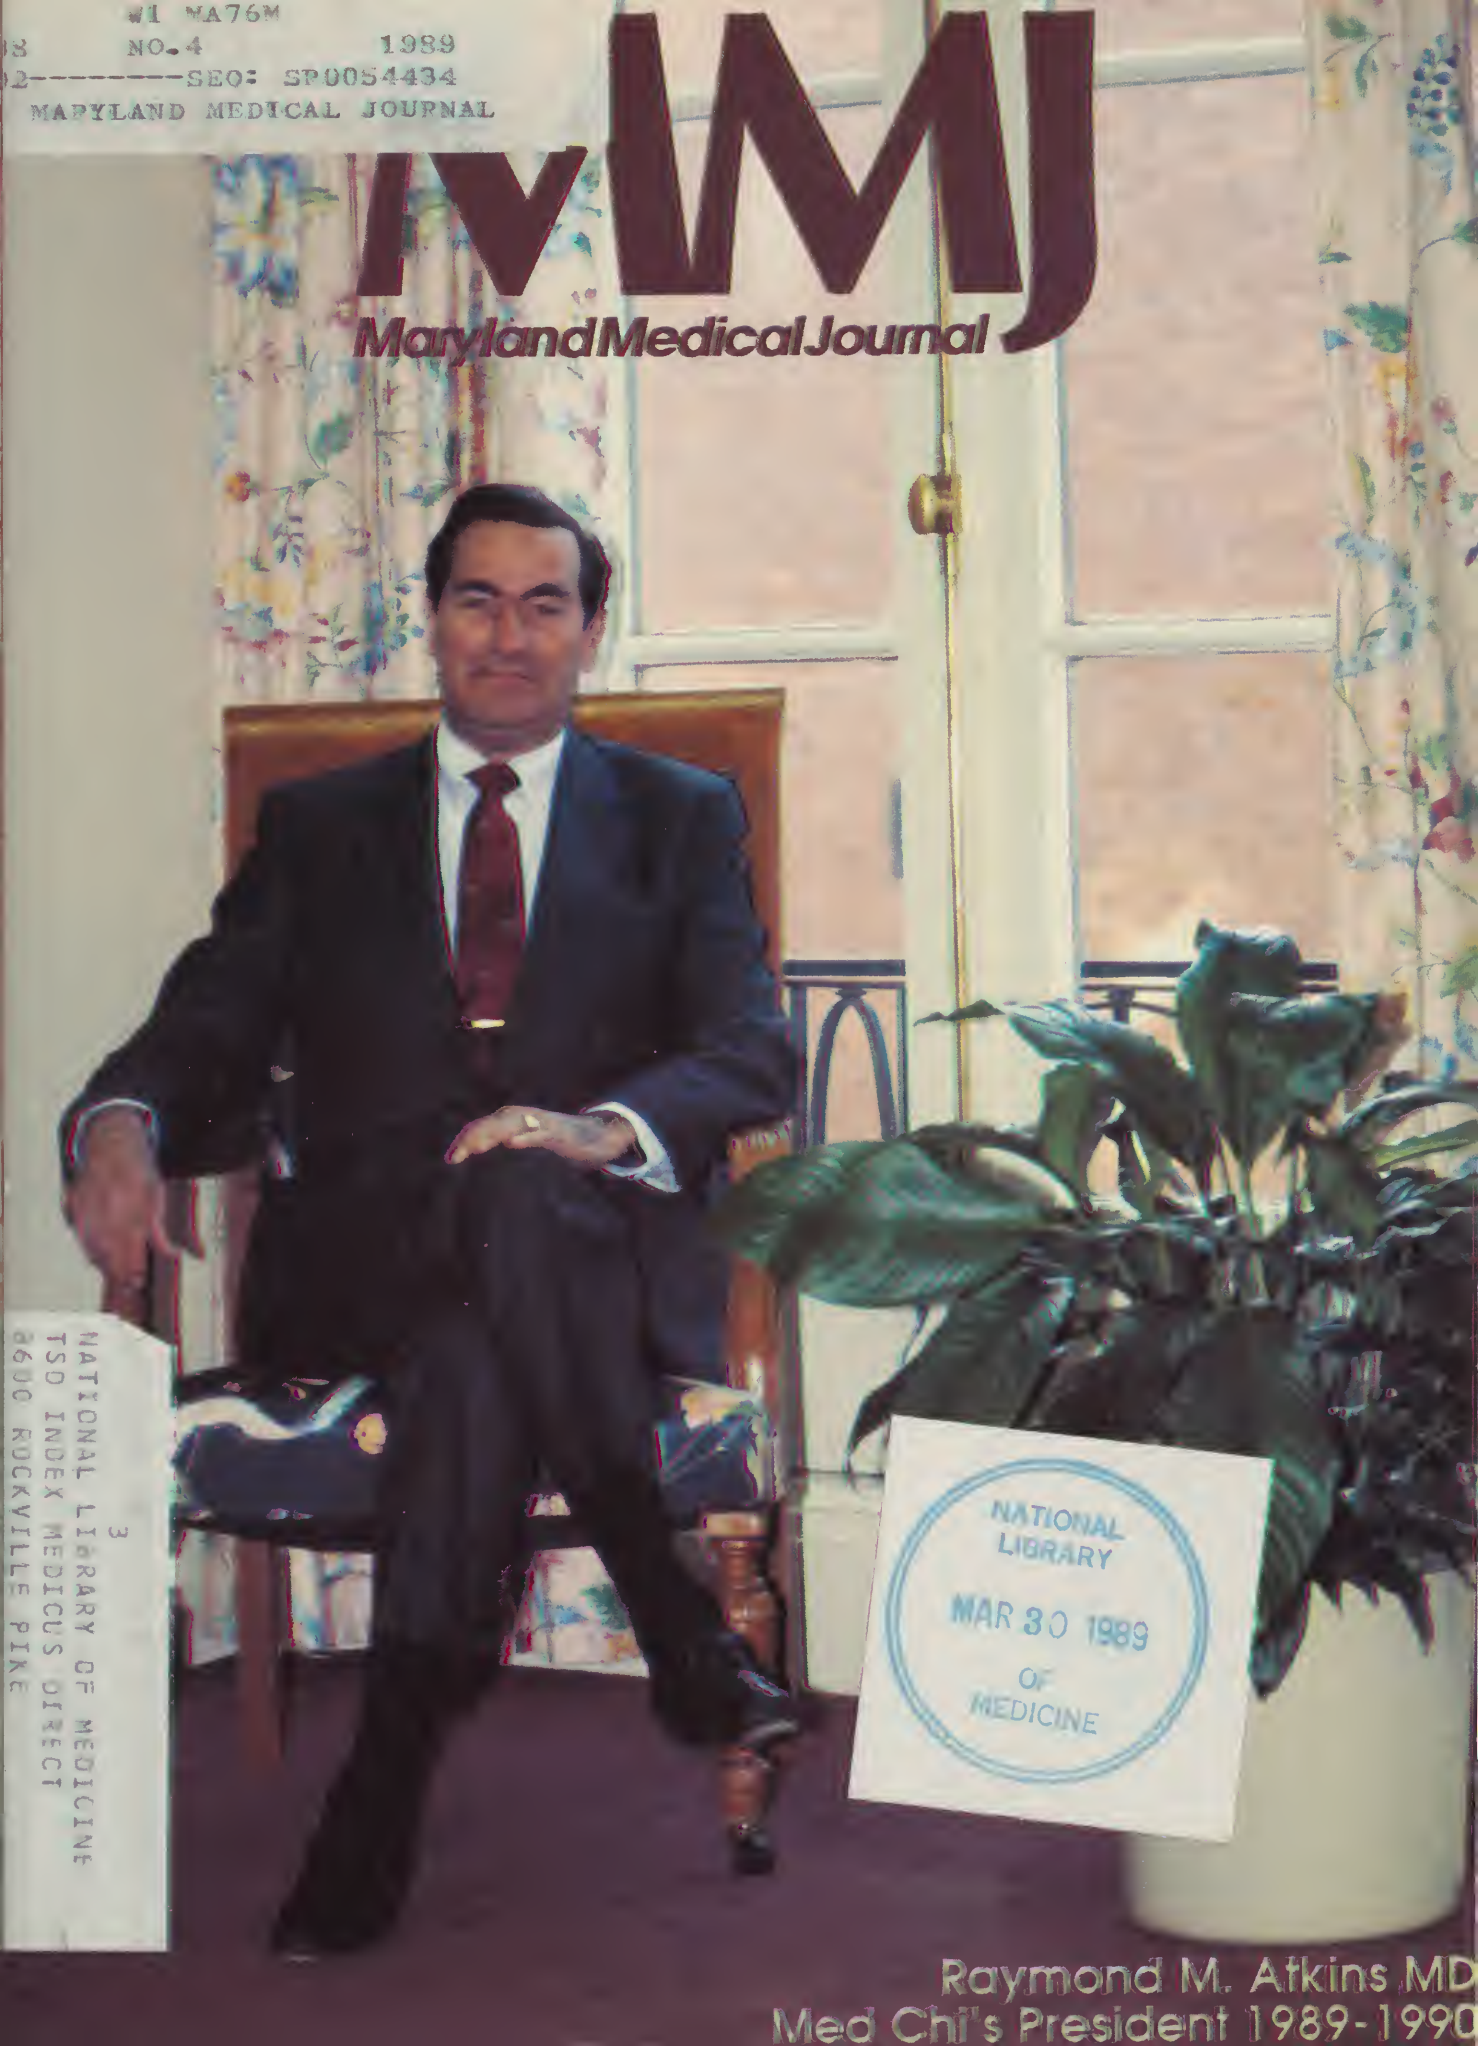
ROCHE

PRESIDENT'S ACHIEVEMENT AWARD

Presenting the winners of the 1989 Roche President's Achievement Awards

Roche Laboratories is proud to honor these outstanding sales representatives, chosen for their unparalleled dedication to the health-care field, professionalism and consistent high level of performance. Please join us in congratulating these exceptional individuals.

John B. Bailey



Paula T. Diamond

Turn to the preceding page and find out how your award-winning Roche representative can help both you *and* your patients.

Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

The Exclusive Valet Pick-Up & Delivery Dealer

A Choice.
Just what the doctors ordered.

For years, Maryland physicians have wanted an option when choosing their medical malpractice insurance coverage. Now Princeton Insurance Company provides that choice through its exclusive Occurrence Plus policy. This protection is available to the physician who meets or exceeds underwriting and risk management qualifications designed to control claims experience, and insurance costs, over the long run.

Occurrence Plus means complete protection -- with no tail to buy -- ever. Period.

For more information, contact one of the independent insurance agents that represent Princeton.

Dear Reader:

With this issue we begin a new phase in the development of the *Maryland Medical Journal.* While retaining all the Departments that regularly appear in *MMJ*, we have reorganized their placement and updated their design for easier reader access.

We look to you for reactions to these changes as well as suggestions on what you would like to see in future issues of *MMJ.*

As always, we hope you will communicate regularly and often with the members of the Editorial Board by submitting scientific articles, Commentaries, and Letters to the Editor.

Sincerely,
The Editorial Board

DRUGS FOR TREATMENT OF PARASITIC INFECTIONS
(Continued from the March 1989 Issue)

Infection	Drug	Adult Dosage*	Pediatric Dosage*
STRONGYLOIDIASIS (Strongyloides stercoralis)			
Drug of choice:[34]	Thiabendazole	25 mg/kg bid (max. 3 grams/d) x 2d[35]	25 mg/kg bid (max. 3 grams/d) x 2d[35]
TAPEWORM infection — **Adult or intestinal stage**			
Diphyllobothrium latum (fish), Taenia saginata (beef), Taenia solium (pork),[36] Dipylidium caninum (dog)			
Drug of choice:	Niclosamide	A single dose of 4 tablets (2 grams) chewed thoroughly	11-34 kg: a single dose of 2 tablets (1 gram); >34 kg: a single dose of 3 tablets (1.5 grams)
OR	Praziquantel[7]	10-20 mg/kg once	10-20 mg/kg once
Hymenolepis nana (dwarf tapeworm)			
Drug of choice:	Praziquantel[7]	25 mg/kg once	25 mg/kg once
Alternative:	Niclosamide	A single daily dose of 4 tablets (2 grams) chewed thoroughly, then 2 tablets daily x 6d	11-34 kg: a single dose of 2 tablets (1 gram) x 1d, then 1 tablet (0.5g)/d x 6d; >34 kg: a single dose of 3 tablets (1.5 grams) x 1d, then 2 tablets (1 gram)/d x 6d
— **Larval or tissue stage**			
Echinococcus granulosus (sheep, cattle, human, deer Hydatid cysts)			
Drug of choice:	See footnote 37		
Echinococcus multilocularis[38]			
Cysticercus cellulosae (cysticercosis)			
Drug of choice:[39]	Praziquantel[7]	50 mg/kg/d in 3 divided doses x 14d	50 mg/kg/d in 3 divided doses x 14d
Alternative:	Surgery		
Toxocariasis, see VISCERAL LARVA MIGRANS			
TOXOPLASMOSIS (Toxoplasma gondii)[40]			
Drugs of choice:	Pyrimethamine[41]	25 mg/d x 3-4 wks	2 mg/kg/d x 3d, then 1 mg/kg/d[42] (max. 25 mg/d) x 4 wks
	plus trisulfapyrimidines	2-6 grams/d x 3-4 wks	100-200 mg/kg/d x 3-4 wks
Alternative:	Spiramycin	2-4 grams/d x 3-4 wks	50-100 mg/kg/d x 3-4 wks
TRICHINOSIS (Trichinella spiralis)			
Drugs of choice:	Steroids for severe symptoms		
	plus thiabendazole[43]	25 mg/kg bid x 5d (max. 3 grams/d)	25 mg/kg bid x 5d
TRICHOMONIASIS (Trichomonas vaginalis)			
Drug of choice:[44]	Metronidazole[3]	2 grams once or 250 mg tid orally x 7d	15 mg/kg/d orally in 3 doses x 7d

Infection	Drug	Adult Dosage*	Pediatric Dosage*
TRICHOSTRONGYLUS infection			
Drug of choice:	Thiabendazole[7]	25 mg/kg bid x 2d (max 3 grams/d)	25 mg/kg bid x 2d
Alternative:	Pyrantel pamoate[7]	11 mg/kg once (max 1 gram)	11 mg/kg once (max. 1 gram)
TRICHURIASIS (Trichuris trichiura, whipworm)			
Drug of choice:	Mebendazole	100 mg bid x 3d	100 mg bid x 3d for children >2yrs
TRYPANOSOMIASIS			
T. cruzi (South American trypanosomiasis, Chagas' disease)			
Drug of choice:	Nifurtimox[2]	8-10 mg/kg d orally in 4 divided doses x 120d	1-10 yrs 15-20 mg/kg d in 4 divided doses x 90d, 11-16 yrs. 12.5-15 mg/kg d in 4 divided doses x 90d
Alternative:	Benznidazole[45]	5-7 mg/kg x 30-120d	
T. gambiense; T. rhodesiense (African trypanosomiasis, sleeping sickness)			
hemolymphatic stage			
Drug of choice:[46]	Suramin[2]	100-200 mg (test dose) IV, then 1 gram IV on days 1,3 7,14, and 21	20 mg/kg on days 1,3,7,14 and 21
Alternative:	Pentamidine isethionate	4 mg/kg/d IM x 10d	4 mg/kg d IM x 10d
late disease with CNS involvement			
Drug of choice:[46]	Melarsoprol[2,47]	2-3.6 mg/kg d IV x 3 doses; after 1 wk 3.6 mg kg/d IV x 3 doses, repeat again after 10-21 days	18-25 mg kg total over 1 mo. Initial dose of 0.36 mg kg IV, increasing gradually to max 3.6 mg/kg at intervals of 1-5d for total of 9-10 doses
Alternatives:	Tryparsamide	One injection of 30 mg/kg IV every 5d to total of 12 injections, may be repeated after 1 mo.	Unknown
	plus suramin[2]	One injection of 10 mg/kg IV every 5d to total of 12 injections; may be repeated after 1 mo	
VISCERAL LARVA MIGRANS[48]			
Drug of choice:[49]	Diethylcarbamazine[7]	2 mg/kg tid x 7-10d	2 mg/kg tid x 7-10d
OR	Thiabendazole	25 mg/kg bid x 5d (max. 3 grams/d)	25 mg/kg bid x 5d (max. 3 g/d)
Alternative:	Mebendazole[7]	200-400 mg/d x 5d[50]	
Whipworm, see TRICHURIASIS			
Wuchereria bancrofti, see FILARIASIS			

16. Ivermectin may also be effective.
17. Ivermectin in a dose of 200 µg/kg has been reported to be as effective as diethylcarbamazine in decreasing the number of microfilaria and causes fewer adverse ophthalmologic reactions (BM Greene et al, N Engl J Med, 313:133, 1985; AT White et al, J Infect Dis, 156:463, 1987). Semiannual to annual prophylaxis appears to be effective in keeping microfilarial counts at low levels.
18. Some Medical Letter consultants use suramin only if ocular microfilariae persist after diethylcarbamazine therapy and nodulectomy.
19. Unlike infections with other flukes, fasciola hepatica infections may not respond to praziquantel. Limited data indicate that albendazole may be effective in this condition.
20. Given on empty stomach. Although approved for human use, it is available currently only as a veterinary product. No alcoholic beverage should be consumed before or for 12 hours after therapy. Keep patient at bedrest for 4 hours after treatment.
21. In felines, ancylol (2, 6, diodo-4-nitrophenol) by subcutaneous injection has been effective against migrating larvae.
22. Albendazole is also effective (RNG Pugh, Ann Trop Med Parasitol, 80:565, 1986).
23. In sulfonamide-sensitive patients, such as some patients with AIDS, pyrimethamine 50-75 mg daily has been effective. In immunocompromised patients, it may be necessary to continue therapy indefinitely.
24. Limited data indicate that ketoconazole, 400 to 600 mg daily for 28 days, may be effective for treatment of L. panamensis and L. mexicana (cutaneous).
25. For the African form of visceral leishmaniasis, therapy may have to be extended to at least 30 days and may have to be repeated.
26. Ketoconazole, 400 mg daily for four to eight weeks, has also been reported to be effective (J Viallet et al, Am J Trop Med Hyg, 35:491, 1986).
27. Application of heat 39° to 42°C directly to the lesion for 20 to 32 hours over a period of 10 to 12 days has been reported to be effective in L. tropica minor (FA Neva et al, Am J Trop Med Hyg, 33:800, 1984).
28. For infestation of eyelashes with crab lice, use petrolatum.
29. FDA-approved for head lice only.
30. Some consultants recommend a second application one week later to kill hatching progeny.
31. AIDS patients may need longer duration of therapy. For AIDS patients who develop hypersensitivity or resistance to both TMP/SMX and pentamidine, trimetrexate with leucovorin rescue or a combination of dapsone and trimethoprim may be effective. Aerosolized pentamidine has been tried for both treatment and prophylaxis (Medical Letter, 29:103, 1987).
32. 5% permethrin, not yet marketed in the USA, could prove to be the drug of choice when it becomes available.
33. In East Africa, the dose should be increased to 30 mg/kg d, and in Egypt and South Africa, 30 mg/kg/d x 2d. Neuropsychiatric disturbances and seizures have been reported in some patients (H Stokvis et al, Am J Trop Med Hyg, 35:330, 1986).

Infection	Drug	Adult Dosage*	Pediatric Dosage*

34 Albendazole or ivermectin have also been effective

35. In disseminated strongyloidiasis, thiabendazole therapy should be continued for at least five days. In immunocompromised patients it may be necessary to continue therapy or use other agents (see footnote 34)

36 Niclosamide is effective for the treatment of T. solium but, since it causes disintegration of segments and release of viable eggs, its use creates a theoretical risk of causing cysticercosis. It should therefore be followed in three or four hours by a purge. Quinacrine is preferred by some clinicians because it expels T. solium intact.

37. Surgical resection of cysts is the treatment of choice. When surgery is contraindicated, or cysts rupture spontaneously during surgery, mebendazole (experimental for this purpose in the USA) can be tried (JF Wilson and RL Rausch, Ann Trop Med Parasitol, 76:165, 1982; ADM Bryceson et al, Trans R Soc Trop Med Hyg, 76:510, 1982). Albendazole has also been reported to be effective (DL Morris et al, JAMA, 253:2053, 1985) Flubendazole has also been used with some success (E Tellez-Giron et al, Am J Trop Med Hyg, 33:627, 1984) Praziquantel and albendazole will kill protoscolices and may be useful in case of spill during surgery

38. Surgical excision is the only reliable means of treatment although recent reports have been encouraging about use of albendazole or mebendazole (JF Wilson et al, Am J Trop Med Hyg, 37:162, 1987; A Davis et al, Bull WHO, 64:383, 1986)

39. Corticosteroids should be given for two to three days before and during praziquantel therapy Praziquantel should not be used for ocular or spinal cord cysticercosis Metrifonate 7.5 mg/kg x 5d, repeated six times at two-week intervals, has been reported to be effective for ocular as well as cerebral and subcutaneous disease. Albendazole, 15 mg/kg x 30d, which can be repeated, has been used successfully (F Escobedo et al, Arch Intern Med, 147:738, 1987).

40 In ocular toxoplasmosis, corticosteroids should also be used for anti-inflammatory effect on the eyes

41. Pyrimethamine is teratogenic in animals. To prevent hematological toxicity from pyrimethamine, it is advisable to give leucovorin (folinic acid), about 10 mg/day, either by injection or orally. Pyrimethamine alone 50-75 mg daily has been used to treat CNS toxoplasmosis after sulfonamide sensitivity develops. In AIDS patients treatment should continue indefinitely

42. Every two to three days for infants Most authorities would treat congenitally infected newborns for about one year.

43. The efficacy of thiabendazole for trichinosis is not clearly established, it appears to be effective during the intestinal phase but its effect on larvae that have migrated is questionable. In the tissue phase, mebendazole 200-400 mg tid x 3 days, then 400-500 mg tid x 10 days, may be effective. Albendazole may also be effective for this indication

44. Sexual partners should be treated simultaneously Outside the USA, ornidazole and tinidazole have been used for this condition. Metronidazole-resistant strains have been reported; higher doses of metronidazole for longer periods of time are sometimes effective against these strains.

45. Limited data

46. In drug-resistant cases of T. gambiense infections, eflornithine (difluoromethylornithine, Merrell Dow) has been used successfully; field trials are now underway (H Taelman et al, Am J Med, 82:607, 1987; F Doua et al, Am J Trop Med Hyg, 37:525, 1987; J Pepin et al, Lancet, 2:1431, 1987). It is highly effective in both CNS and non-CNS infections with T. gambiense.

47. In frail patients, begin with as little as 18 mg and increase the dose progressively. Pretreatment with suramin has been advocated for debilitated patients.

48. For severe symptoms or eye involvement, corticosteroids can be used in addition.

49. Ivermectin and albendazole have been effective in some animal studies.

50. One report of a cure using 1 gram tid for 21 days has been published (A Bekhti, Ann Intern Med, 100:463, 1984).

Reprinted with permission of THE MEDICAL LETTER, February 12, 1988, Vol. 30 (Issue 759).

Risks Associated with Human Parvovirus B19 Infection

The Centers for Disease Control (CDC) in conjunction with a large consultant group representing public health, clinicians, and researchers has recently reviewed the risks associated with human parvovirus B19, the etiologic agent of fifth disease (erythema infectiosum). The report, published in the Morbidity and Mortality Weekly Report, February 17, 1989, Volume 38, pp. 81 through 97, was "developed to assist physicians, public health officials, and other health-care professionals respond to public concerns about recently recognized serious complications of human parvovirus B19 infection, including transient aplastic crisis, chronic anemia, and fetal death."

Additional information concerning the management of school and child care facility outbreaks of fifth disease is being developed by the Maryland Department of Health and Mental Hygiene (DHMH) and the Department of Education. Information is being prepared on the procedures by which physicians can obtain serologic testing of pregnant women exposed to fifth disease. Such testing is available from the CDC through the DHMH. This information will be printed in the Maryland Communicable Disease Bulletin which is mailed directly to physicians.

We have developed a fact sheet, which is reproduced on the next page. It can be copied for your patients who desire additional information, and additional copies will soon be available through our office by calling 301-225-6677.

FIFTH DISEASE (Erythema Infectiosum) Fact Sheet

What is fifth disease?

Fifth disease (also known as "Erythema Infectiosum") is a mild rash illness that primarily affects school age children. Fifth disease is caused by a human virus called parvovirus B19.

How common is fifth disease?

Many people already have had fifth disease before they reach young adulthood. Most people get infected between 5 and 14 years of age. It is estimated that approximately half the adults in the United States have already been infected with parvovirus B19 and have lifetime immunity.

What are the symptoms of fifth disease?

Symptoms usually occur within 4 to 14 days after a person has been exposed, but may take as long as 20 days to develop. The characteristic feature of fifth disease is a red, patchy facial rash (giving a "slapped cheek" appearance) that may spread to the rest of the body in a lace-like pattern. The rash may be preceded by fever, headache, bodyache, sore throat, congestion, runny nose, cough, nausea, or diarrhea. In adult cases, joint pains or arthritis is likely to occur. Approximately 25% of cases have no symptoms. In both children and adults, the disease is usually mild and recovery occurs without problems.

How is fifth disease spread?

The virus is spread by exposure to airborne droplets from the nose and throat of infected people. The virus can also be transmitted by blood or blood products. People with fifth disease are most contagious before the onset of rash. By the time the rash or joint pains develop, spread to others is likely to have already occurred.

How is fifth disease diagnosed?

In most cases, the disease is diagnosed based on the appearance of typical symptoms. A specific blood test has been developed, but is available primarily for pregnant women exposed to fifth disease.

What problems are associated with parvovirus infection?

Miscarriages and stillbirths have been uncommonly associated with parvovirus infection, particularly when the infection occurs during the first half of pregnancy. No birth defects have been associated with parvovirus infection to date. Parvovirus infection may result in severe anemia in people with immunodeficiency or chronic red blood cell disorders, such as sickle cell anemia.

Is fifth disease treatable?

Currently, no specific treatment or vaccine is available.

What control measures should be taken?

In general, no control measures are necessary. Since the greatest risk of viral spread occurs before symptoms begin, exclusion of children with fifth disease from school or day care is not recommended. It is not known whether pregnant women or others at risk of complications who work in schools, day care, or health care settings can effectively prevent infection by staying home. Pregnant women and others at risk should consult with their physicians if they have been in contact with a case of fifth disease, however, the Maryland Department of Health and Mental Hygiene does not recommend the routine exclusion of those at risk from settings where fifth disease is occurring.

A Review of Available Smoking Cessation Methods, 1989

Mark T. Godenick MD, MPH

A two-part series on smoking and health highlights recent findings emphasizing the impact of smoking on society in terms of health and economic costs. While 3 percent of smokers quit spontaneously each year, smoking remains a tremendous problem.

Smoking is the number one cause of preventable morbidity and mortality in the United States today.[1] The annual death toll is in excess of 350,000 persons per year, which exceeds the total number of American soldiers killed in WWI, Korea, and Vietnam combined.[2] The Surgeon General estimates that 30 percent or 170,000 of 565,000 annual deaths from coronary heart disease (CHD) are attributable to smoking.[3] Another 30 percent or 125,000 of 412,000 annual deaths from cancer, mostly lung cancer, are attributable to smoking.[4] Chronic obstructive lung disease accounts for an additional 62,000 annual smoking-related deaths.[5] In Maryland in 1985 there were an estimated 5,266 smoking attributable deaths with 38,491 years of potential life lost before average life expectancy. This results in 121.3 lives lost due to smoking per 100,000 persons.[6]

In addition to this enormous loss of life, cigarette smoking is responsible for substantial morbidity. Diseases that have been shown to be strongly related to smoking include CHD, stroke, chronic obstructive lung disease, peripheral vascular disease, and cancers of the lung, larynx, oral cavity, esophagus, bladder, kidney, and pancreas. There were an estimated 5,000 new cancers and 7,500 new heart attacks due to smoking in Maryland in 1987.[7] Smoking also is strongly related to low birth weight and to delayed conception. Diseases adversely affected by smoking include peptic ulcer disease and periodontal disease.

Smoking Prevalence

An estimated 60 million Americans continue to smoke. Smoking prevalence rates have dropped annually from over 50 percent of men in the 1950s and nearly 35 percent of women in the mid-1960s to 33 percent of men and 28 percent of women in 1985.[8] There are 1.2 million smokers in Maryland, with an overall 34 percent of adults smoking.[9] If the current decrease in prevalence rate of smoking continues, it is estimated that by the year 2000 nearly 20 percent of men and 23 percent of women will be smoking.[10]

Economics of Smoking

The tobacco industry commissioned Chase Econometrics to estimate the economic contribution of the tobacco industry to the nation in 1983. They estimated $31.5 billion was contributed to the Gross National Product and 710,000 jobs were created by tobacco and related industries. However, the economic costs to society are greater. The Congressional Office of Technology Assessment estimated that $22 billion in health care costs and $43 billion in productivity losses would occur in 1985.[11] These amounts increase every year, and they do not account for costs to society in human terms. Improved health, not money, should motivate the drive for a smoke-free society by the year 2000.

From tobacco tax revenues and farm income to the state of Maryland in 1986 total income was $105 million; the total per pack revenue amounted to $.20. However, the direct and indirect death and illness costs of smoking in Maryland in 1986 were $993 million, accounting for 7 percent of health care costs. Calculated health care costs per pack of cigarettes smoked in Maryland for 1986 were $1.87.[7] It is apparent that it is not cost effective for our society to continue to smoke.

Smoking Cessation Makes a Difference

Is smoking cessation a worthwhile goal with respect to improved health and longevity? Examination of two smoking-related diseases that currently affect most individuals in the United States (cardiovascular disease and lung cancer) will help answer this question.

The combined death rate for all cardiovascular disease has declined over 40 percent since 1950. From 1963 to 1984 coronary heart disease mortality rates have declined by 31 percent for white males, 19 percent for black males, and 35 percent for white and black females.[12] This parallels the decreasing cigarette smoking rates. There is a variable latency period between exposure and onset of disease in all smoking-related diseases. Current trends in the incidence rates of smoking-related diseases reflect effects of past levels of cigarette consumption. The risk of CHD attributable to smoking declines over 50 percent after one year of cessation. It approaches that of a nonsmoker after a decade. The degree of risk reduction is determined by the length of time since cessation and by the cumulative "pack-years" of smoking by the individual.[3]

Lung cancer mortality rates have continued to rise. The total number of lung cancers has increased from about 18,000 in 1950 to about 130,000 in 1986.[13] However, the incidence of new cases of lung cancer recently has dropped about 4 percent in white men.[14] If the decline in new cases continues, eventually there will be a decline in mortality. This supports the long latency period between exposure and onset of lung cancer that has been suggested in the large cohort studies on this subject.

Data pertaining to women are more sobering. In 1986 lung cancer surpassed the former leading cause of cancer death, breast cancer. The death rate from breast cancer has stood unchanged since 1950 at about 23 to 24 per 100,000, whereas the lung cancer death rate has risen an average of 6 percent since the early 1960s to about 25 per 100,000 women in 1986.[15] This increase reflects the high prevalence of smoking in the cohorts of aging women.

The cost effectiveness of counseling smokers to quit was recently estimated by Cummings *et al.* The findings were based on the author's estimate of the effectiveness of physician counseling (2.7 percent) and one third the average cost of an office visit to a physician plus the cost of a smoking cessation self-help booklet ($12). The cost-effectiveness of brief advice during routine office visits ranged from $705 to $988 per year of life saved for men and from $1,204 to $2,058 for women. This compares favorably to other accepted medical preventive practices such as discussing the treatment of mild to moderate hypertension or hypercholesterolemia.[16]

Treatment Strategies

Although most smokers who quit do so without any help, a significant number of people need encouragement to quit. Cigarette smoking is a powerful habit to break, and knowledge about the health hazards of smoking may be insufficient to overcome the addiction to tobacco. The average smoker attempting to quit makes an average of three attempts before achieving success. Thus, even though a person may be unsuccessful in smoking cessation, any honest attempt at quitting is better than no attempt at all and is part of the learning process of quitting. A physician should not convey a sense of frustration, since this might lead the patient to feel guilty and to avoid attempting to quit again. It is best to recognize his or her difficulties and encourage the patient to change.

Physicians should be knowledgeable about the different methods of smoking cessation available in their practice area as well as the strengths and limitations of each method.

These methods can be categorized into four main types: (1) self-help methods, self-help aids, and mass media approaches, (2) physician or health professional directed minimal interventions such as brief office counseling, using single session acupuncture, or hypnosis, (3) comprehensive smoking cessation programs, and (4) either method 2 or 3 above combined with a pharmacologic aid such as Nicorette gum or clonidine. The Table lists these methods, which will be discussed next month.

Patient Characteristics to Consider

Abrams[17] suggests that when thinking about how best to aid a patient who is seriously considering smoking cessation it is useful to keep four patient characteristics in mind:

1. How motivated is this person to quit?
2. How biologically addicted is this person to cigarettes? A person who smokes more than 25 cigarettes per day, usually smokes within 30 minutes of waking, and smokes even when ill with a respiratory infection or a cold is considered to be biologically addicted.
3. How psychologically addicted is this person to cigarettes? An individual who smokes to handle stressful situations or social encounters, or whose moods depend on smoking is considered to be psychologically addicted.
4. Has he/she attempted to quit before? If so, what method was used and what was the outcome?

A smoker who is less biologically and psychologically addicted and who is a first-time quitter may be a candidate for self-help or minimal contact smoking cessation methods. A smoker who smokes heavily and who is more biologically and psychologically addicted may be better helped by a smoking cessation program in conjunction with a pharmacologic aid. Throughout, the physician always should be a positive force encouraging the patient and coordinating a successful smoking cessation attempt.

Promoting Smoking Cessation in the Office

The patient's health advisor can promote smoking cessation in several ways. First, provide the proper role model. The physician should not smoke and should maintain a nonsmoking environment in the office. Second, become knowledgeable about the health hazards of smoking and the benefits of quitting and take the time to convey this information in a firm, but kindly and nonthreatening manner, to each patient who smokes. Third, assess the smoker's needs and desires and identify his/her smoking characteristics. Fourth, discuss with the patient the available options and recommend the best approach. Take time to listen to the patient who will attempt to stop smoking. A patient's thoughts are important! And last, advise the

Table. Smoking Cessation Methods

1. Self-Help Methods, Aids, and Mass Media Events
   - Pamphlets and booklets
   - Commercial books
   - Stop smoking aids
   - Mass-media programs
2. Minimal Intervention by Physician or Health Profcssional
   - Physician counseling
   - Hypnosis
   - Acupuncture
3. Comprehensive Smoking Cessation Program
   - Not-for-profit groups and clinics
   - Commercial programs
4. Pharmacologic Aids to Smoking Cessation
   - Nicorette
   - Clonidine

patient to act on the selected smoking cessation strategy.

Follow-up should be conducted at the next office visit to assess progress.

Once a person has quit, physicians can employ some strategies to help prevent relapse. At each subsequent office visit, remind the patient of the health hazards of smoking and the benefits of cessation and congratulate him or her on the attempt to quit whether or not it was successful. It should be emphasized that repeated attempts often are needed to quit. Referral to maintenance programs in the community can be made.

Next month's article will focus on specific methods available for patients to successfully stop smoking. Many recent studies will be reviewed to point out the strengths and weaknesses of each smoking cessation method.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to the Physician Placement Service. 1211 Cathedral St., Baltimore, MD 21201; telephone 301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

At its January 28th, 1989 meeting, Med Chi's Council passed the following resolution. This resolution was submitted to Council by the Committee on Alcoholism and Chemical Dependency and is in keeping with earlier resolutions passed by the Council and the House of Delegates aimed at reducing smoking and the health hazards that smoking represents. Pending during this year's session of the Maryland General Assembly is Senate Bill #65, which, if passed, would restrict the means by which tobacco products may be distributed. Sponsoring this bill is Senator Vernon F. Boozer (301-841-3706). Those interested in passage of this legislation should call Senator Boozer to voice their support.

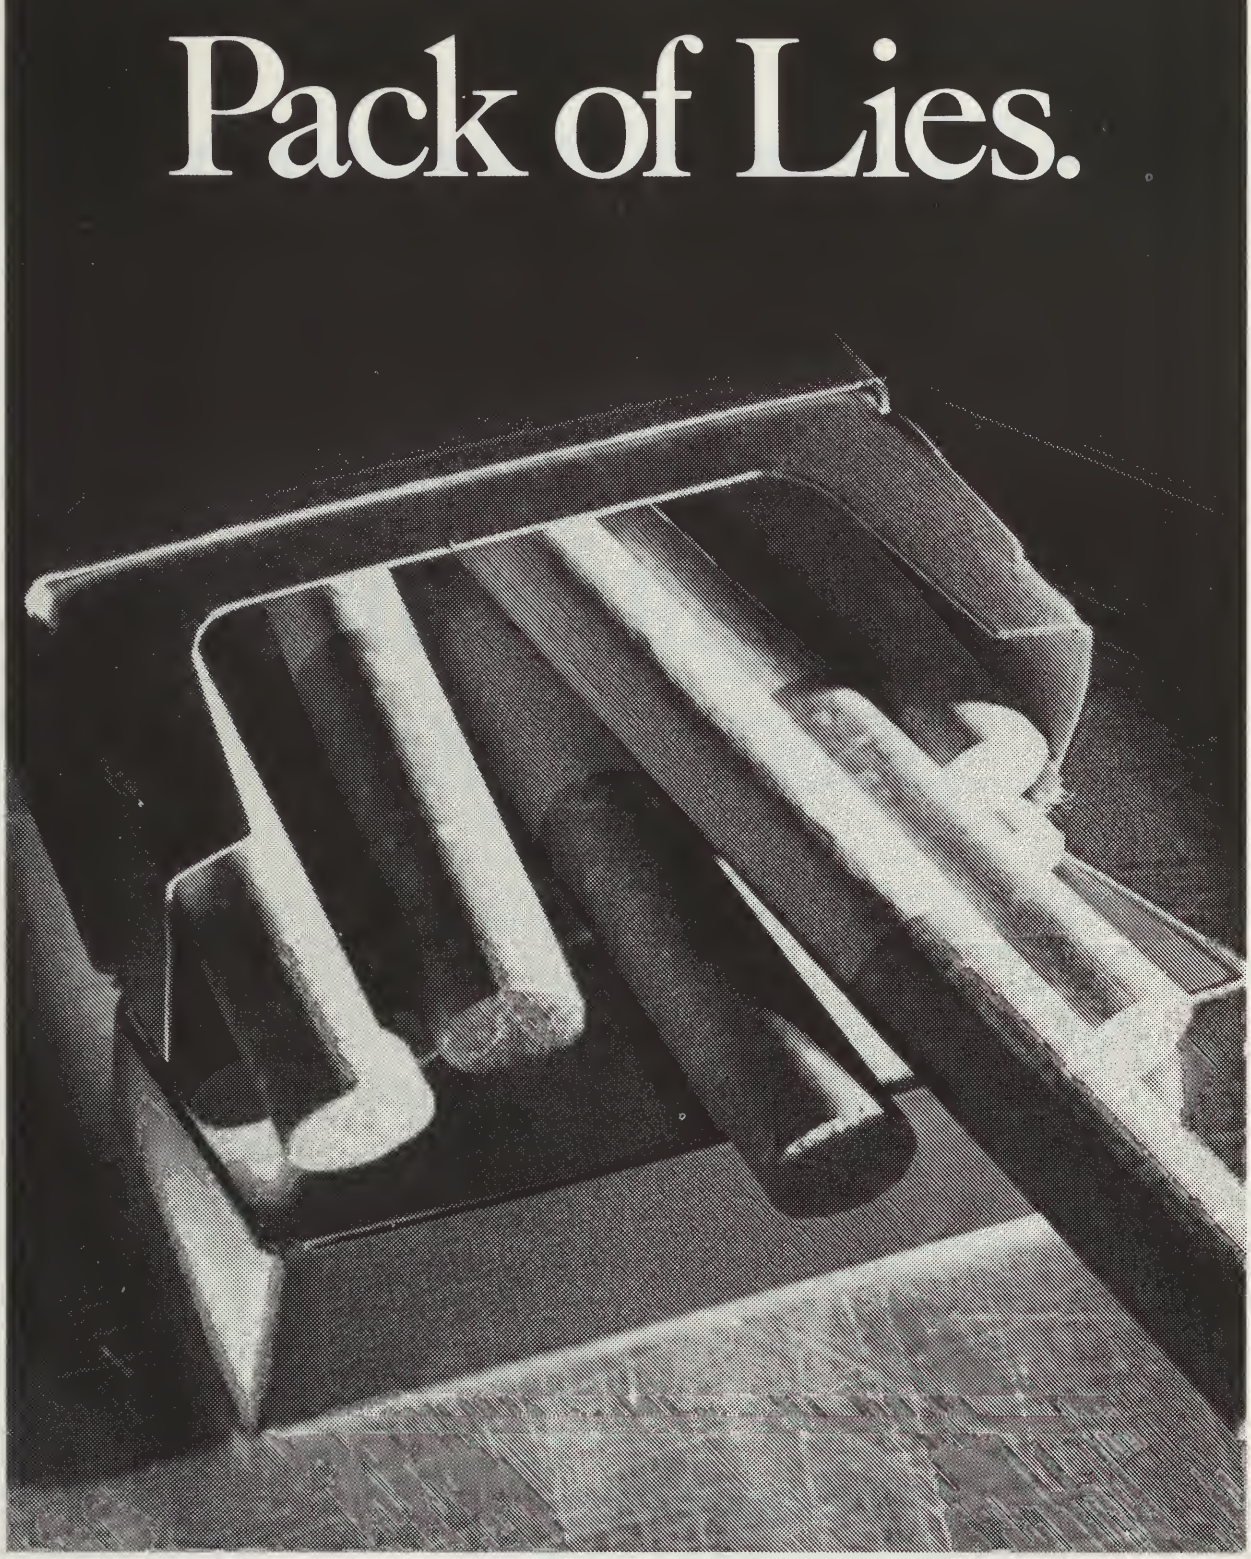
Resolution of the Medical and Chirurgical Faculty of Maryland

Resolution on Limiting the
Sale of Tobacco Products

Whereas, Cigarette smoking is a major cause of death, disease and high medical costs in the United States;

Whereas, Nicotine is not only a drug but an addictive drug, and;

Whereas, Legal restrictions on the sale of tobacco may result in significant reduction of its use among the general population, thereby reducing the incidence of morbidity and mortality resulting from such use, therefore, be it



Resolved, That the Medical and Chirurgical Faculty of Maryland supports efforts towards legislation limiting the sale of tobacco products in Maryland; and be it therefore

Resolved, That support for such legislation may include action aimed at raising the minimum age required for the purchase of tobacco products and restricting the means by which tobacco products may be sold.

Pack of Lies.

What are the three biggest lies in the world?
Smoking is relaxing. Smoking is glamorous. Lung cancer won't happen to me.
This year, 125,000 Americans learned the truth about smoking
when they were diagnosed with lung cancer.

EVERY QUITTER IS A WINNER.

AMERICAN CANCER SOCIETY

Created as a public service by McCaffrey and McCall, Inc.

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $5 million for individual doctors and $7.5 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

Executive Director's Newsletter

April 1989

New Medicare Part B Requirement

Beginning April 1, 1989, physicians will be required to use ICD-9 codes on all Medicare Part B claims. The AMA has persuaded HCFA to delay enforcement of this provision until June 1, 1989 in order to apprise physicians of the change. Failure of physicians to comply with the requirement could result in monetary penalties of up to $2,000 per incident, or exclusion from the Medicare program.

Important! Liability Insurance Coverage

Mutal Fire Inland and Marine Malpractice Insurance Company is not approved to do business in Maryland because of its insolvency. Since Mutual Fire is a surplus line insurer, it is not covered by the Property and Casualty Insurance Guaranty Corporation which covers insurance claims arising out of insurance policy contracts of insolvent insurers. Any physician who purchased Mutual Fire should notify the Faculty in order to receive an update to Mutual Fire's reorganization plan for covering claims of its insured. Please contact Erica Parker at the Faculty for information on Mutual Fire's reorganization plan at 539-0872 or 1-800-492-1056 in Maryland.

Medical Exemptions for Safety-Belt Use

Maryland law requires automobile drivers and front seat passengers to wear safety-belts but provides for the possibility of medical exemption from the law for drivers and/or passengers with a written verification from a physician stating that he/she is unable to wear a safety-belt for medical reasons. According to the Maryland Committee on Safety-Belt Use, Inc., there are no routine medical grounds for granting medical exemption to the safety-belt law. For more information regarding proper safety-belt use and special medical conditions, see the article entitled *Medical Exemption Provision of Maryland's Safety-Belt Use Law* on page 298 of this issue.

Seminar on Permanent Impairment

Med Chi and the AMA are sponsoring, *Using Guides to the Evaluation of Permanent Impairment*, on Saturday June 10 at the Stouffer Harborplace Hotel in Baltimore. The all day seminar will instruct users of the AMA's *Guides* on how to conduct impairment evaluations and how to understand the new clinical concepts introduced in the *Guides* latest edition. The seminar will feature major contributors to the *Guides* and will fulfill 7 credit hours in Category 1 of the Physicians Recognition Award of the AMA. To register for the seminar complete the form on the following page. For more information on the seminar contact Betsy Newman at the Faculty.

Commemorative Stone

The AMA recently embarked on a campaign to restore a commemorative stone housed in the Washington Monument. Donated in 1853 by the AMA, the stone "symbolized physicians' devotion to the new republic founded on freedom." Over the years, erosion and defacement have damaged the stone. Med Chi hopes that Maryland physicians will help the AMA rededicate this historic stone by contributing to this endeavor. Contributions to the campaign should be addressed to: AMA Stone/National Park Service, P.O. Box 109016, Chicago, IL 60610-9016.

The Nurse Physician Relationship

The Maryland Hospital Education Institute (MHEI) is sponsoring a seminar on *The Nurse-Physician Relationship* on April 11, 1989 at the Hyatt Regency Inner Harbor Hotel in Baltimore. The seminar fulfills 6 hours in Category 1 of the Physician's Recognition Award of the AMA. For registration information contact Beth Morgan, Program Coordinator for MHEI at (301) 321-6200 ext.315. Med Chi has agreed to participate in a joint task force on the Nurse-Physician Relationship along with the Maryland Hospital Association, the Maryland Nursing Association and the Maryland Association for Nursing Homes. Marilyn Goldwater, from the Department of Health and Mental Hygiene is the coordinator of the task force.

Promoting Smoking Cessation

On April 28, 1989 the American Cancer Society (ACS) will present *Promoting Smoking Cessation: New Opportunities for the Health Professional* at the Sheraton Inner Harbor Hotel in Baltimore. For more information contact ACS Medical Affairs Department at (301) 529-7272.

Fax Machine

In order to facilitate communication between Med Chi, its component societies, physician membership, and the medical community a fax machine was recently installed at the Faculty. Med Chi's fax number is 301-547-0915. Med Chi staff is also studying the feasibility of an arrangement whereby fax machines may be made available within component society offices, or for those societies having no office, in the hopital medical staff offices within their county.

USING GUIDES TO THE EVALUATION OF PERMANENT IMPAIRMENT

A Seminar sponsored by the Medical and Chirurigical Faculty of Maryland and the American Medical Association.

Saturday, June 10, 1989
Stouffer Harborplace Hotel, Baltimore, MD

This all day seminar will instruct users of the AMA's *Guides to the Evaluation of Permanent Impairment* -- physicians, attorneys, insurance administrators and others -- how to conduct impairment evaluations and how to understand the new clinical concepts introduced in the *Guides* latest edition. Seminar speakers are major contributors to the *Guides*.

After attending this seminar, you will have:

- An understanding of the validity of the *Guides*
- An understanding of the basic concepts and techniques described in *Guides* and of their everyday applications
- Knowledge of the concepts used in evaluating impairment of the spine
- Knowledge of the concepts used in evaluating impairment of the upper extremity, with case presentations
- Knowledge of the relationship between pain and impairment and of the impact of pain on evaluating impairment

The American Medical Association designates this continuing medical education activity for 7 credit hours in Category 1 of the Physicians Recognition Award of the AMA.

Register NOW, space is limited to 200 persons.

Registration Form: **USING GUIDES TO THE EVALUATION OF PERMANENT IMPAIRMENT**

OVER A CENTURY AGO,

a thousand visionary physicians across the nation bestowed a commemorative stone carving to the Washington Monument. This patriotic display symbolized their unrelenting devotion to a new republic founded on freedoms—including the freedom to practice medicine for the best possible health of all its people. *Today your help is needed to restore this symbol of our profession.*

Because the commemorative stone has suffered from severe erosion and defacement, the American Medical Association is launching a campaign to raise money from physicians to restore this symbol of medicine for the National Park Service. Every contribution made to this effort will serve as a statement of each physician's personal affirmation and commitment to health and medicine in America.

Please take part in rededicating the commemorative stone as a shining example of the strength of medicine in a free and strong society. Contributors who donate $100 or more will receive a memorial replica of the carving as a token of appreciation. Send your tax deductible contribution for this timeless symbol today. Thank you.

Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors, and members of the ministering profession.

We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **(301) 465-3322 or (202) 621-4965**.

Fortieth Anniversary
1949 - 1989

The Woman's Auxiliary to the American Medical Association was organized in 1922 as the logical outgrowth of state and county auxiliaries already in existence in Texas, South Dakota, Oklahoma, Maine, Minnesota, and Montana.

In 1949 the American Medical Association was anxious to have auxiliaries in all the states to help oppose the legislative tendencies toward the socialization of medicine. The Auxiliary was to function as a liaison between the medical profession and the general public. Its members were to be ready to explain the position of medicine when requested or when the opportunity presented itself.

The Medical and Chirurgical Faculty of the State of Maryland adopted a resolution to form a state women's auxiliary at its Semiannual Meeting held in Chestertown, in September 1949.

The organizational meeting of the Women's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland was held November 15, 1949 at the Faculty building. Mrs. Thomas A. Christensen was Acting Chairman, and Mrs. George H. Yeager was Acting Secretary for this meeting. Mrs. Frank J. Otenasek, Chairman of the Constitution and Bylaws Committee, read the proposed constitution, which was adopted. The meeting then proceeded with the reading and adoption of the Bylaws.

The following officers were nominated and elected:

President	Mrs. Thomas A. Christensen
President-elect	Mrs. J. M. T. Finney, Jr.
1st Vice-President	Mrs. Eldridge H. Wolff
2nd Vice-President	Mrs. John G. Ball
3rd Vice-President	Mrs. Charles A. Reifschneider
4th Vice-President	Mrs. A. A. Pearre
Recording Secretary	Mrs. Henry N. Briele
Corresponding Secretary	Mrs. W. K. Waller
Treasurer	Mrs. Page C. Jett
Parliamentarian	Mrs. R. C. Dodson

Counties represented at this meeting were Baltimore, Caroline, Carroll, Cecil, Dorchester, Frederick, Harford, Howard, Kent, Montgomery, Prince George's, Talbot, Washington, Wicomico, Worcester, and Baltimore City.

Past Presidents

+	Mrs. Thomas A. Christensen	1950-51
	Mrs. George H. Yeager	1951-52

Frank J. Ayd, Jr., MD, Emeritus Director of Professional Education and Research at Taylor Manor Hospital, was designated the 1988 recipient of the Paul Hoch Distinguished Service Award of the American College of Neuropsychopharmacology at its recent annual meeting. Established in 1964, the Hoch Award is given periodically to a member of the College who has made unusually significant contributions to the College. One of the founders of the American College of Neuropsychopharmacology, Dr. Ayd has been a Fellow for 27 years.

• • •

Benjamin V. Del Carmen MD, a general surgeon in private practice in Towson, was elected President of the Baltimore County Medical Association at its recent Annual Meeting. A graduate of the University of the Philippines, Dr. Del Carmen is certified by the American Board of Surgery and is a Fellow of the American College of Surgeons. Other officers elected were President-Elect *Esther Edery MD*, Vice-3President *Harold B. Bob MD*, Secretary *Louis C. Breschi MD*, and Treasurer *Marianne Benkert MD*.

• • •

Karl F. Mech, Jr., MD assumed the post of president of the St. Agnes Hospital Medical Staff recently, after serving a one-year term as president-elect. Dr. Mech received his medical degree from the University of Maryland School of Medicine. He served a surgical internship at the University of Pittsburgh and a surgical residency as well as a residency in thoracic and cardiovascular surgery at the University of Maryland Hospital.

• • •

The Wicomico County Medical Society's leadership changed hands recently with the installation of officers for 1989. *Hilda I. Houlihan MD*, the first female preseident in the history of the Society, presided at the annual meeting at which *James A. Cockey MD* was installed. Serving with Dr. Cockey will be *Floyd E. Gray MD* as Vice-President and *Richard H. Meeks MD* as Secretary-Treasurer.

Dr. Cockey, an internist in Salisbury, received his medical degree from the University of Maryland School of Medicine and served both his internship and residency at Maryland General Hospital. He has been practicing in Salisbury since 1983.

Dr. Gray also has been in practice since 1983, in the specialty of obstetrics and gynecology. Following medical school at the University of Virginia, he served his internship and residency at the University of Tennessee.

An ophthalmologist who has practiced in Salisbury since 1982, *Dr. Meeks* graduated from The Ohio State University School of Medicine and went on to an internship at Riverside Methodist Hospital in Columbus and residency at The Ohio State University. ■

Area meetings and course announcements are listed each month under *Doctors Take Note*

Executive Committee - November 17, 1988

Minutes The Executive Committee Minutes of October 20, 1988 with the exception of the "Executive Session" portion were approved with the following addendum:

Resolution 1S/88 - Gun Control Legislation

A telephone conference call was held on October 4, 1988 with these members of the Executive Committee participating: Reynaldo Lee-Llacer MD, Council Chairman; Raymond Atkins MD; Harold Bob MD; Jose Yosuico MD. The Executive Committee discussed the support of Resolution 1S/88 on Gun Control Legislation that was approved by the House of Delegates on September 24, 1988. It was the consensus that because of the immense funding being provided for both sides, no Med-Chi funds would be expended on this issue.

The House of Delegates Minutes of September 24, 1988 were approved as distributed.

Agenda Items for Council Meeting - November 19, 1988 - A motion was adopted to defer the following agenda items for discussion at the Council meeting on Saturday, November 19, 1988: Update on HB-1285-Veto Override, Peer Review, Real-Time Monitoring Update, Prescribing of Psychotropic Medications by Psychologists, Resolution on Medicare Secondary Payer Program, Medicaid - Diversion of Services, and Medicaid Survey Status/House of Delegates Meeting.

Council - November 19, 1988

RBRVS Members of the Ad Hoc Interspecialty Committee (who were invited to hear the briefing by Dorothy Moss of the AMA Department of Federal Affairs) were introduced and welcomed by the Council.

Dorothy Moss, AMA Department of Federal Affairs, presented information on the RBRVS and its implications on the practice of medicine. In closing, Ms. Moss informed Council that Reference Committee A of the AMA House of Delegates would convene a special meeting in Dallas on December 4, 1988 at 2 p.m. regarding RBRVS. Following her presentation, time was allotted for a question-and-answer period from the membership. Ms. Moss was thanked by Council for her informative presentation.

Drs. Raymond Atkins and Leon Kassel reported briefly on their perspective of the AMA/RBRVS meeting held in Chicago on November 13, 1988, which they attended.

Council Meetings Dr. Joseph Snyder introduced a motion to change the Council meetings from 10 a.m. on Saturday back to 4 p.m. on Thursday (with the exception of the annual and semiannual meetings). Background information on this issue revealed that the day of the meeting was initially changed to accommodate physicians from outlying areas of the state. Following discussion, a motion was adopted to defer the matter until sufficient data could be provided to Council for review.

Resolution on Medicare Secondary Payer Program Council approved a resolution submitted by the Montgomery County Medical Society, "Medicare Secondary Payer program," to be introduced at the AMA for introduction into the AMA House of Delegates Interim meeting, December 4-7. The resolution is as follows:

Whereas, It is the policy of the Health Care Financing Administration to provide incentives for physicians to become participating physicians;

Whereas, The burdens of the Secondary Payer Program fall disproportionately on participating physicians;

Whereas, Physicians are encouraged to accept assignment for all patients needing to be treated on such a basis;

Whereas, Beneficiaries are already confused by the rules, regulations and paperwork required by HCFA;

Whereas, Medicare's Secondary Payer Program has had the effect of leaving many appropriately provided services unreimbursed; and

Whereas, The program's effect has become a disincentive to treatment of Medicare patients; therefore, be it

RESOLVED, that the American Medical Association urge the Health Care Financing Administration to revise the Medicare Secondary Payer Program so that the determination of other insurance is made at the time of initial application, or in the case of established beneficiaries, in a manner separate from the claims processing mechanism.

Emeritus Membership Council approved the following members for Emeritus Membership, at the request of the component society indicated:

Baltimore City
John M. Gerwig MD, Baltimore
Pearl T. Scholz MD, Baltimore

Baltimore County
Clarence McWilliams MD, Reisterstown

Calvert County
George Weems MD, Huntingtown

Frederick County
Henry P. Laughlin MD, Union Bridge

Harford County
William K. Brendle MD, Havre de Grace

Montgomery County
Jonas C. Kolker MD, Chevy Chase
Louis H. Shuman MD, Silver Spring
Thomas M. Wilson MD, Bethesda

Wicomico County
Earl M. Beardsley MD, Salisbury

These names will be forwarded to the House of Delegates with a recommendation for approval.

Ad Hoc Building Committee Report On behalf of the Building Committee, Dr. George Malouf, Chairman, recommended that Council approve the acquisition of a building in Annapolis, pending independent building and land appraisal and management analysis of its commercial rental potential. The two-story building, consisting of first floor commercial rental space and a second floor of five individual partitioned offices, is located directly across from the Maryland Inn and one block from the Governor's Mansion and the State House. The building will be used as a Med-Chi office for Faculty members during the legislative session and also has the potential for subleasing. The financial implications of purchasing this building (at an estimated price of not more than $500,000) have been studied by the Finance Committee. Dr. Lawrence Fink, Montgomery County, asked if it would be necessary to place an assessment on Med-Chi members to support the acquisition. Mr. Harrison, Med-Chi Controller, indicated that an assessment would not be necessary. A motion to approve the purchase of the building in Annapolis was adopted by Council.

Professional Ethics Committee The following ethical and policy statements were presented by Dr. Louis C. Breschi, Chairman of the Professional Ethics Committee. After discussion, the Council acted on each policy as follows:

Second Surgical Opinion - APPROVED

New Statement

A physician who renders a second opinion may be asked to assist in the surgery. While not in and of itself unethical, the situation presents great opportunity for abuse. Accordingly, a physician rendering a second surgical opinion should only assist in that surgery if no other qualified physician is available.

Physicians Services Rendered to Dependents - APPROVED

Revised Statement

(a) It is (not good judgment) GENERALLY INADVISABLE for a physician to render services to his own family members.

Delete

(b) The Medicare laws prohibit payments to physicians for rendering medical services to members of their own families.

Industrial Medical Referrals - APPROVED

Delete original statement

(a) It is the opinion of the Faculty legal counsel (and it has been confirmed by the Workmen's Compensation Commission) that an individual has the right to choose his own physician for care:

"It is my opinion that the company cannot make an employee go to a company-selected doctor. The employee may select his own doctor; and secondly, if an employee received an injury growing out of the course and scope of his employment, the company must pay the doctor's bill, whether or not authorized. The supervisor of a company cannot determine what claims are compensable and what claims are not. This rests within the power and jurisdiction of the Workmen's Compensation Commission. If a claim is a compensable one and the supervisor should refuse to authorize it, the company is responsible irrespective of the supervisor's action."

(b) In addition, the Workmen's Compensation Commission, in a communication dated 3/6/62, states:

"It has always been the position of this Commission that the claimant has freedom of choice to select a qualified physician or surgeon to treat him."

Miscellaneous Statement on Compulsory Hospital Assessment of Hospital Staff - APPROVED

No change to original statement.

6.MISCELLANEOUS

The Faculty is opposed to compulsory assessment of hospital staff members for construction and equipment. These are the capital expenditures of the hospital and should not be the responsibility of its medical staff.

Percentage Fee Charges - APPROVED

Delete original statement.

The Faculty is opposed to the charging of a percentage fee by a hospital for clerical services in collection of physicians' fees or completion of insurance claim forms.

Professional Courtesy - APPROVED

Revise original statement. Delete word "solely."

8.PROFESSIONAL COURTESY

(a)It is the recommendation of the Faculty that patient physicians who offer to pay for their treatment should be freely allowed to do so, in the interest of providing medical care to members of the medical profession and their families. The following guidelines are offered as suggestions to aid physicians in resolving questions related to professional courtesy.

(b)Where professional courtesy is offered by a physician but the recipient of services insists upon payment, the physician need not be embarrassed to accept a fee for his services.

(c)Professional courtesy is a tradition that applies [solely] to the relationship that exists among physicians. If a physician or his dependents have insurance providing benefits for medical or surgical care, a physician who renders such service may accept the insurance benefits without violating the traditional ethical practice of physicians caring for the medical needs of colleagues and their dependents without charge.

(d)In the situation where a physician is called

upon to render services to other physicians or their immediate families with such frequency as to involve a significant proportion of his professional time, or in cases of long-term extended treatment, fees may be charged on an adjusted basis so as not to impose an unreasonable burden upon the physician rendering services.

(c)Professional courtesy should always be extended without qualification to the physician in financial hardship, and members of his immediate family who are dependent upon him.

Insurance Committee Report On recommendation of the Executive Committee, Council approved a motion that Med-Chi act as the vehicle by which Faculty members may participate in the Prime Financial Benefit Trust, pending review by legal counsel. The Prime Financial Benefit Trust is a tax planning and cash value program geared solely for physician employers to enable them to receive certain tax advantages.

Committee on Hospital Medical Staffs Dr. Victor Hrehorovich, Chairman of the Committee on Hospital Medical Staffs, presented the following recommendations, which were approved by the Executive Committee for adoption by Council. After discussion, the Council acted on each recommendation as follows:

1. (a) Authorized the Committee on Hospital Medical Staffs to act in a consultative capacity with the Division of Licensing and Certification, DHMH, and (b) the Committee be designated as the medical review committee liaison with the Division of Licensing and Certification, DHMH, on issues of quality assurance in the hospital setting.

2. Approved the development of a centralized consultation service available to subscribing medical staffs to provide assistance in the development, improvement, and problem resolution involving quality assurance activities. Such services are to be provided on a contractual basis and through the Med Chi service corporation.

3. Approved the Committee's recommendation that Med Chi obtain from all professional liability insurers doing business in Maryland the criteria for approved risk-management programs that may qualify participating physicians for reduction in annual malpractice premiums.

4. Approved expenditure not to exceed $15,000 to be used for the development of model hospital medical staff bylaws, specific under Maryland law.

Executive Committee - December 15, 1988

Medicaid Diversion Project Dr. Karl M. Green, Chairman, Liaison Committee with the Department of Health and Mental Hygiene, presented recommendations for review by the Executive Committee. Prepared by the Committee in conjunction with the Maryland Chapter of the American College of Emergency Physicians, American Academy of Pediatrics, American Academy of Family Practice, and the Maryland Society for Internal Medicine the recommendations are:

1. That fees for Medicaid visits be standard for the private physician, emergency department, outpatient clinic, and hospital clinic, and that they be competitive with office visit rates in the State of Maryland.

2. That as part of this plan, the claim processing procedure be streamlined and expedited to permit payment within 30 days of claim submission, and that the Project no longer require a physician's signature on each claim form.

3. That diagnostic testing in emergency departments and hospital clinics be reviewed for appropriateness of the presenting complaint to reduce unnecessary Medicaid expenditures.

4. That if any "gatekeeper" arrangement is deemed necessary, it be established on a contractual voluntary basis and not compulsory. This includes emergency departments.

5. That special consideration be given to a capitation method for the treatment and care of Medicaid patients to include case management, capitation fee plus fee for service, and referral fee.

6. That the individual function of the Department of Human Resources and Medical Assistance Program be combined so that one entity will be involved in determination of eligibility, issuance of cards, reimbursement, etc.

The Committee also reviewed a Report of the Special Joint Legislative Committee on the Medical Assistance Program and concurred with the recommendations set forth in the final report.

Upon recommendation of the Liaison Committee, the Executive Committee approved a motion to accept the report for referral to the Legislative Committee for appropriate action. The Liaison Committee will continue to monitor the Medicaid Diversion proposal.

Peer Review Manual On behalf of the Physician Quality Assurance Board, the Physician Peer Review Manual draft was presented for review and discussion. After discussion, the following motion was adopted by the Executive Committee:

That the Faculty's Peer Review Committee:

1. Distribute the draft Peer Review Manual to those component societies involved in the peer review function for review and comment;

2. Hold a meeting with the component societies' Peer Review Committee to discuss their input; and

3. Forward a copy of the final draft of the Peer Review Manual to the Council members in sufficient time for their review prior to the January 28, 1989 Council meeting.

Public Health Committee Structure Dr. Hilary T. O'Herlihy, Co-Chairman of the Committee on Public Health, presented a proposal for consolidation of the method by which the Faculty identifies and acts on issues dealing with public health.

After discussion, the Executive Committee approved

a motion to forward these recommendations to the Bylaws Committee for consideration, and also to obtain input from the various committees that would be affected by the proposal.

Council Attendance The Council meeting attendance statistics were compiled and analyzed as requested by the Council at its meeting on November 19, 1988. Changing the Council meetings from Thursday to Saturday resulted in a 3 percent decrease in attendance. The Executive Committee accepted this information for further discussion at the Council meeting in January.

Legislation on Personal Injury Protection (PIP) It was reported that Med-Chi had been requested to take a neutral stand on upcoming legislation regarding PIP. Following a lengthy discussion, the Executive Committee voted to take no position on the issue.

Liaison Committee with Third Party Carriers Dr. Aristides C. Alevizatos, Chairman of the Liaison Committee with Third-Party Carriers, submitted a proposed Bylaw change for consideration by the Executive Committee. These recommendations will broaden the Committee's involvement to include health maintenance organizations and other managed systems of health care delivery. After discussion, the Executive Committee adopted a motion to refer the proposal to the Bylaws Committee.

Committee on Mental Health The Committee on Mental Health requested approval to develop guidelines for physician referrals to social workers to address concerns raised by the following Opinion of the Attorney General (Opinion No. 88-049 [November 9, 1988]):

1. A clinical social worker may not render a diagnosis unless the patient has first been seen by a physician and referred to the social worker.
2. However, once a physician has seen the patient and referred the patient to a clinical social worker, the social worker may make a diagnosis of the person's social, mental, or emotional disorder and may use whatever diagnostic coding is appropriate for the patient's medical records and for insurance reimbursement purposes.

The Executive Committee approved the committee's request to proceed with the development of the guidelines. The final guidelines will be submitted for the approval of the Executive Committee and the Council.

Committee on Hospital Medical Staffs An update on the working plan established by the Committee on Hospital Medical Staffs to develop model hospital medical staff bylaws specific to Maryland law was provided.

Psychiatric Physician Issues The Executive Committee accepted as information correspondence forwarded to Adele Wilzack RN, MS, Secretary, Department of Health and Mental Hygiene, from the Maryland Psychiatric Society and the Alliance for the Mentally Ill, addressing issues regarding physician leadership within the Department of Health and Mental Hygiene.

LifeCard A draft letter to Thomas J. Durel, President, LifeCard International, was presented for discussion. This letter addresses the implementation of a monthly charge being assessed to physicians who transmit insurance claims electronically and requests clarification on the behalf of subscribing physicians. The Executive Committee approved the draft letter, which will be completed for mailing.

Pennsylvania Medical Society Donald G. Ferguson MD, President of the Pennsylvania Medical Society, forwarded a complimentary letter to Med Chi expressing appreciation for their recent visit and sharing of information and innovative ideas.

Attention: Member Photographers

The *Maryland Medical Journal* is building a file of Maryland pictures to use on our covers. Please submit your best shots of scenes around the state. If there can be a medical connection, so much the better. We can use

glossy prints (not slides or negatives)

We will either reduce or enlarge your prints to *MMJ* cover size (approximately 8 1/2 × 11). Send your nonreturnable photos to *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201.

THE SECRET IS OUT

"I believe if I were starting out in medicine today the Southern Medical Association would be one of the first organizations that I would want to join. For the price you pay, I believe that you have access to more information and more services than other organizations available."

Thomas C. Rowland, Jr., M.D.
OB/GYN
Columbia, SC

Since 1906, the Southern Medical Association has been the best kept secret in the South. No longer! The word is out and everybody's talking.

They're talking about the educational benefits of belonging to the largest regional multi-specialty association in the U.S. and the diversity of the Annual Scientific Assembly.

They're talking about a non-political association whose only mission is to provide the best educational and financial benefits available anywhere.

They're also talking about unrivaled member benefits including the SMA Insurance Program, the Physicians' Purchasing Program, the SMA Retirement Program, SMA Travel Services, Dial Access, the *Southern Medical Journal* and many, many more.

But most of all, they're talking about how SMA can offer so much at such a low cost.

Call the SMA for more information and a membership application. Find out why more and more physicians are joining the SMA every day.

Join the SMA today . . . You'll be talking about us too!

Continent Urinary Diversion for Improved Quality of Life

Currently, the therapy of invasive bladder cancer is cystectomy and urinary diversion. The conventional urinary diversions (including ileal and sigmoid loops) require stomas and serve as conduits rather than reservoirs. The ideal urinary diversion should preserve the urinary and sexual functions. It also should function as a reservoir, protecting the kidneys from reflux and urinary tract infection. Furthermore, the ideal urinary diversion should eradicate the cancer and leave the patient with no external appliance. In 1983 in search of an ideal urinary diversion, we began a pilot study at the University of Maryland, School of Medicine to test the feasibility of creating such a procedure for patients with invasive bladder cancer who required radical cystoprostatectomy. We modified the Kock Pouch and anastomosed it directly to the urethra with an intact sphincter after a radical nerve-sparing cystoprostatectomy; it was designated as Maryland Pouch (Figure). Initially, we reported four cases with long-term follow-ups and concluded that "this procedure provides a low-pressure, high-volume reservoir without reflux that is handled easily by patients after cystoprostatectomy."[1]

Reviewing our current experience and practice of urinary diversion with the patients requiring cystectomy for invasive bladder cancer, we find there has been no local recurrence. Our series encompasses 16 patients, who now have been followed from 6 to 58 (mean 25) months.

The capacity of the reservoirs has been 340 to 500 ml with low pressure. Radiological studies, including pelvic computerized tomography and pouchogram have demonstrated a satisfactory upper collecting system with no reflux to the kidneys.[2]

Since 1983, when we began this continent urinary diversion procedure, we have been cautious in selecting only patients at low risk for local pelvic recurrence. All our patients had a negative prostatic urethral biopsy and showed no cancer at the bladder neck, representing a low-risk group for any local recurrence. Although 5 to 8 percent of such patients may still be a risk for urethral recurrence, this can be detected easily with follow-up cytology and with radiological and endoscopic procedures. We believe such a minimal risk is justified to improve the quality of life of these patients by eliminating the stoma and by preserving potency. We recommend this operation for patients who are motivated, compliant, and have an intense desire to improve the quality of their life.

Patients' initial enthusiasm and later disenchantment with a number of urinary diversion procedures during past decades have taught us to place the final value of a procedure after the test of time. Therefore, although it appears this procedure is ideal, follow-ups are desirable to assess its true value.

A number of investigators have tested the Maryland Pouch with satisfactory results.[3] We believe that elimination of the stoma, urinary tract infection, and preservation of potency as well as urinary continence and renal function will improve the quality of life of patients requiring cystectomy for bladder cancer.

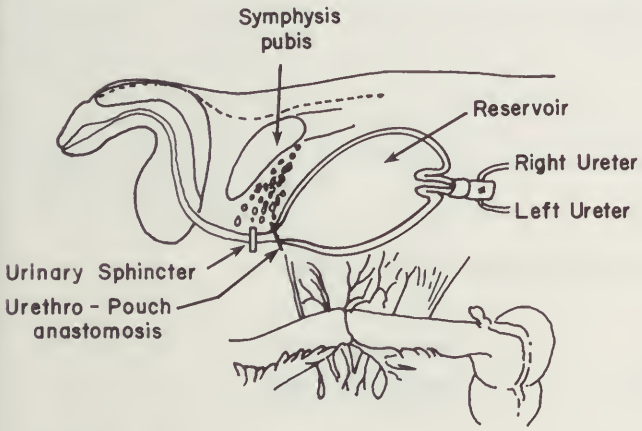

Figure: The Maryland Pouch: direct anastomosis of the ileal pouch to the urethra after nerve-sparing cystectomy for invasive bladder cancer.

University of Maryland

Tumor conferences are held weekly on Tuesday between 8-9 am in Room N13E28 at the University of Maryland Medical System. This is an open meeting and physicians are welcome to attend. Physicians can present cases, but please call 328-5224 by noon Monday to obtain time on the schedule for your case(s) and bring the pathological slides with you.

If you have any questions, call or write the Surgical Oncology Program at the University of Maryland Medical System, Room N13E02, Baltimore, Maryland 21202 (301-328-5224). ■

One Minute With Diabetes

Diabetic Children and Camps

Doctor, my nine-year-old son has had insulin-dependent diabetes for two years. I am afraid to let him out of my sight for fear that he will eat food that he should not or will have a hypoglycemic reaction. I occasionally find evidence that he has been cheating on his meal plan by getting into the cookies or cereal. I give him his insulin and test his blood glucose twice a day. What should I do?

This nine-year-old sounds very normal to me. It is time for the mother to begin shifting the responsibility for adequate diabetic care to her son as well as time that he learn the rules necessary for reasonable diabetic control. Then he will be more willing to cooperate.

Children seven to nine years old gradually will assume the administration of their own insulin and testing if encouraged to do so. The term "gradually" is important because accuracy of dose and technique of administration are things that must be monitored by an adult until confidence is acquired. This is especially true if insulin mixtures are used. Sometimes a shared program works well in transition. In a shared program, the parent and the child take turns in giving insulin and blood glucose testing.

Blood glucose testing by capillary glucose monitoring equipment is easy to do. Understanding the value of the procedure, children usually take over without a problem. The important thing is for them to understand the value of the test and to recognize that they feel better when the diabetes is adequately controlled.

Cheating on the diet or meal plan is not a problem specific to diabetic children. Any normal child will come into the house and help himself to cookies or any other food in sight because he is hungry. Scolding or criticizing is not in order. Ask your physician or dietitian to consider increasing the meal plan or adjusting the foods to add a snack in the plan whenever he might be hungry. Place that food or fruit where it is readily available when he comes into the house and everyone will be happier.

Camps for diabetic children are very helpful for the child to learn self-care, responsibility, and that he is not alone in the world with diabetes. Camps help parents gradually become willing to allow some sharing of the responsibility of the diabetic patient's care. Nearby Camp Glyndon (in Glyndon MD) is available to all diabetic children from seven through fifteen years old. The sessions for the coming season are:

Age	Camp Dates
7 to 9 years	August 6 to 11, 1989
10 to 12 years	July 16 to 28, 1989
13 to 15 years	June 25 to July 7, 1989
Family session	July 9 to 14, 1989
Family session	July 30 to August 4, 1989

The tuition is $225 per week per person but campers hips are available for those who can only pay a part or none of the tuition. The Maryland Affiliate of the American Diabetes Association operates Camp Glyndon. Anyone interested in referring a camper should request an application by telephone (1-301-486-5515) or letter (3701 Old Court Rd., Ste. #20, Baltimore, MD 21208.

General, church, privately operated, and scout camps also are available for children. If the medical staffs of those camps are equipped to manage diabetes care and the parent has checked them out, certainly such camps can be used. All camps offer facilities for gradually developing children's responsibility, provide recreation, teach crafts, and permit parents to accept the fact that their children are growing up.

It is always gratifying to observe the improved diabetic care and the maturity of the children when they return to the office for their first appointment after attending a camp session.

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and policies Governing the Practice of Medicine in Maryland.

Medical Records - Ground for Disciplining Physician

The State Board of Physician Quality Assurance has interpreted one of the grounds for disciplining a physician for failure on proper request to provide details of a patient's medical record to another physician or hospital in the following manner:

- "Details," at a minimum, is a written summary of the patient's medical history including a summary of any diagnostic test requested and test results received that assures continuity of medical care. Obviously, providing the patient's complete medical records complies with this section.
- "Proper request" means a request in writing from the patient or the legal representative of the patient.
- "Provides" means to send in a reasonable time (normally within *two weeks* of receiving the request or sooner, if there is an emergency situation, but in any case, not later than four weeks).
- "To another physician or hospital" means exactly that.

In addition, the Board indicated that the licensed physician may charge the patient a reasonable fee when complying with this section; however, the physician may not hold up the providing of details of a medical record dependent on payment of this reasonable fee.

Advertising - AMA Revised Opinion

As a result of an investigation by the FTC into the AMA's opinion on advertising, several minor changes were made in Ethical Opinion 5.01. For example, where the prior opinion had stated "Claims regarding experience, competence, and quality of the physician's service may be made if they can be factually supported and if they do not imply that he has an exclusive and unique skill or remedy," the revised opinion says "Because physicians have an ethical obligation to share medical advances, it is unlikely that a physician will have a truly exclusive or unique skill or remedy. Claims that imply such a skill or remedy, therefore, can be deceptive." Similarly, the prior opinion had stated that, "Testimonials of patients, however, as to the physician's skill or the quality of his professional services should not be publicized," the revised opinion says "At the same time, however, physicians are advised that certain types of communications have a significant potential for deception and should therefore receive special attention. For example, testimonials of patients as to the physician's skill or quality of his professional services tend to be deceptive when they do not reflect the results that patients with conditions comparable to the testimoniant's condition generally receive."

For a copy of the entire revised opinion, please contact the Legal Offices at Med-Chi.

Medical Exemption Provision of Maryland's Safety-Belt-Use Law

Med-Chi's Council strongly supports the use of safety-belts, recognizing that the chances of surviving a motor-vehicle crash are greater when occupants are properly restrained.

Maryland law requires automobile drivers and front-seat passengers to wear safety-belts but provides for the possibility of medical exemption from the law for a driver or front-seat occupant who possesses a written verification from a physician stating that he/she is unable to wear a safety seat belt system for physical or medical reasons; or from a psychiatrist or other specialist qualified to make an informed judgment indicating that he/she is unable to wear a safety seat belt system for psychological reasons.

Decades of experience have proved that safety-belts prevent or mitigate serious or fatal injuries by more than 50 percent. In Maryland, their use could prevent several hundred deaths each year. Additionally, thousands of serious or disabling injuries could be avoided.

In countries and states where safety-belt use is required, less than 1 percent of all motor-vehicle-related injuries are caused by the belt per se, and of that small percentage, the unrestrained occupant would have been more seriously injured if unbelted.

To be most effective, safety-belts should be worn low over the bony pelvis, 2 to 4 inches below the waist, low on the lap, and against the thighs. A safety-belt is properly adjusted when the lap belt is snug and low across the hips and when all of the slack has been removed from the shoulder belt. The shoulder belt should rest as close to the chest as possible and never be worn under the arm.

Since safety-belts are proved lifesavers, giving medical exemptions from the safety-belt-use law is not recommended. There are no routine medical grounds which can be cited for granting medical exemptions to the safety-belt-use law. Each case should be decided on its own merit. If a person is fit to be in control of a vehicle, the evidence indicates that he or she is fit to wear a safety-belt.

Most reasons patients give for wanting medical exemptions result from lack of knowledge. For many patients, an explanation of the purpose and correct adjustment of the safety-belt is enough. Some patients need to be encouraged to adapt the restraint system to their condition (for example, adjusting the position and height of the car seat). In almost all cases, patient education is the answer, not a medical exemption.

A request for exemption should be referred to the practitioner treating the patient for the condition in question. Ultimately, the decision to exempt a patient from safety-belt use rests with the individual physician. Therefore, keeping records of all exemption requests is strongly recommended. If the exemption request is not granted, the reason for denial should be documented.

It is conceivable that physicians who choose to grant medical exemptions may be sued by unrestrained patients subsequently injured in accidents. Physicians granting medical exemptions may be called upon to defend them in court.

If a medical exemption is granted, the physician should keep a record of the medical reason given by the patient for needing the exemption, the documentation of the basis for granting the exemption, and the exemption expiration date. For temporary conditions, a medical exemption should be granted for no more than one year and renewed if necessary.

There are no routine medical grounds wich can be cited for granting medical exemptions to the safety-belt-use law.

The following is a list of special conditions and directions for proper safety-belt use in each of these circumstances:

Pregnancy: Based on research and experience from countries and states with safety-belt use laws, pregnancy at any stage is not a reason for an exemption. In sudies of belted pregnant women involved in motor-vehicle crashes, there has been no evidence of increase in injuries to the fetus or in fetal loss as a result of proper safety-belt use.

Pregnant women should be instructed to position the belts correctly; the lap belt should lie comfortably below the anterior superior iliac spines and the shoulder belt across the costal margin, the sternum, and the clavicle. Thus, no part of the belt is allowed to compress the uterus. In the latter stage of pregnancy, a seat-belt extender may be needed and is available from car dealers.

Musculoskeletal and Disabling Conditions: A correctly worn safety-belt should not restrict the motion of a patient with arthritis of the neck and shoulders. Certain severe abnormal skeletal conditions or orthopaedic devices may make it difficult to fasten a safety-belt properly. These patients should be passengers and are advised to ride in the back seat where they are not required to buckle up. A driver must buckle up.

Physically disabled people will benefit from the use of safety- belts because of the stabilization provided by the restraints.

Scars: Well-healed scars on the chest or abdomen are not harmed by a correctly positioned safety-belt. Occasional irritation and pain have resulted from prolonged wearing of a safety-belt, which is often too loosely positioned, allowing a certain amount of friction and movement over parts of a scar.

Recent, tender, or painful scars may require a foam pad taped to the skin over which the safety-belt lies or taped to the safety- belt itself to prevent irritation and pain.

Pacemakers: Pacemakers are commonly implanted in the upper part of the anterior chest just below the clavicle; however, safety-belts do not generally cause discomfort to the wearer or damage to the pacemaker itself. If the pacemaker has been recently implanted and the surgical wound is still painful, follow the recommendations for recent scars.

Should the wearer be involved in an accident and the pacemaker receive a direct blow, the wearer should have the pacemaker checked for malfunction. However, no malfunctions have been observed clinically or experimentally as a result of safety-belt use.

Ileostomies and Colostomies: Ileostomies and colostomies do not interfere with the use of a correctly worn safety-belt. People with ileostomies and colostomies who have been involved in motor-vehicle crashes while wearing safety-belts have occasionally suffered irritation of the exposed mucosa with some bleeding or even tearing of the mucosa from the stoma wall caused by sudden constriction of the safety-belt. Such injuries are relatively minor compared to what may result from not buckling up.

Psychological Conditions: Patients with claustrophobia can be helped to accept safety-belts by an explanation of the need and reasons for their use. A demonstration of safety-belts as part of the vehicle's operation could serve to overcome such phobias.

Special Height or Weight Conditions: People under five-feet tall may find that the shoulder belt crosses their necks, causing discomfort. They should be referred to their car dealers for possible adjustment of the height of the seat, installation of a power seat, or repositioning of the upper safety-belt mounting point using a drop link. Adjustment of the position or tension of the safety-belt with a comfort clip or the "window shade" feature may also help to alleviate the problem.

People who are extremely obese and find that the safety-belt does not reach across their abdomens should be referred to their car dealers for modification of the existing belt, a safety-belt extender, or for replacement with a more appropriate belt.

Conditions of the Breast: Breast irritation and mastitis are rarely caused by belt use. When the safety-belt is repositioned or the tension of the safety-belt is reduced by the use of a comfort clip, padded safety-belt wrap, or the "window shade" feature, the condition is resolved quickly.

For additional infomation on this and other safety-belt related issues, please contact the Maryland Committee for Safety Belt Use, Inc., 820 Ritchie Highway, Severna Park, MD 21146 (301-544-3603).

This article was written in conjunction with the Maryland Committee for Safety Belt Use, Inc., and is based on state and national research results supplied by that organization.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

**Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts**

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

**Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best**

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you.

CARAFATE®
(sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS
There are no known contraindications to the use of sucralfate.

PRECAUTIONS
Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS
Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE
There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION
The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED
CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088-1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other. Issued 1/87

Carafate® for the ulcer-prone NSAID patient

Aspirin and other nonsteroidal anti-inflammatory drugs weaken mucosal defenses, which may lead NSAID users to become prone to duodenal ulcers.[1] For those NSAID users who do develop duodenal ulcers, CARAFATE® (sucralfate/Marion) is ideal first-line therapy. Carafate rebuilds mucosal defenses through a unique, nonsystemic mode of action. Carafate enhances the body's natural healing ability while it protects damaged mucosa from further injury. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate: therapy for the ulcer-prone patient.

Unique, nonsystemic

CARAFATE®
sucralfate/Marion

History of Bacteriology in Maryland through 1925

John Collinson MD, DrPH (1886 - 1950)

The son of John Collinson MD, Dr. Collinson was born at South River, Anne Arundel County, Maryland, December 31, 1886. He received an AB from St. Johns College, Annapolis, in 1907 and the MD from the University of Maryland in 1911. He was chief of the Bureau of Vital Statistics, Maryland State Department of Health, at the time this article was written. Editor

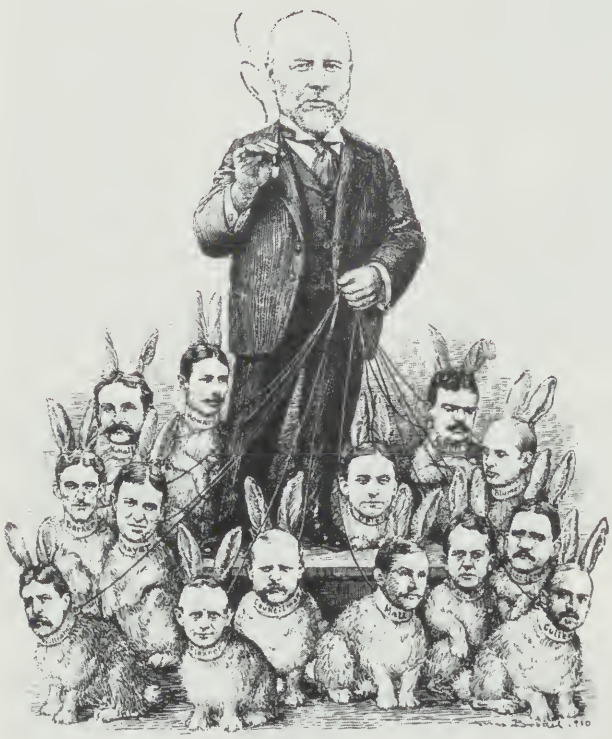
Perhaps the person with the greatest influence on the development of bacteriology in Maryland was Dr. William H. Welch, who, with Dr. T. Mitchell Prudden, is credited with having brought the experimental science to America.

Bacteriology in the State of Maryland has had a history of rapid growth and great achievement. The extension of teaching and laboratory service accelerated, and the work of pioneer students received attention and encouragement. The services of today's bacteriological laboratory are regarded as a matter of course in hospital procedure, and to a large extent they have become the foundation of private practice. In public health they are an essential part of communicable disease control and epidemiological investigation.

The teaching of this science has been outstanding, and the formal courses introduced in the medical schools of the Johns Hopkins University in 1887 and the University of Maryland in 1893 have trained many of the most eminent bacteriologists in the United States. The gradual increase of interest in the subject during the latter half of the nineteenth century is reflected in the Annual Reports of the Departments of Health of Baltimore City and the State of Maryland.

Within the period from 1887 until 1898 papers and reports emphasized the importance of bacteriological examinations. Since the establishment of Baltimore City's diagnostic laboratory in 1896, branches of this service have spread throughout the state. Perhaps the best known of the varied contributions of students of bacteriology here has been the work on yellow fever, dysentery, and malaria.

Teaching



Johns Hopkins University The first teacher of bacteriology in Maryland was Dr. Henry Newell Martin, professor of biology at Johns Hopkins University, 1876-1893. At this time bacteriology was as much a part of physiology as it was a part of botany, and into these courses Martin introduced lectures on bacteriology, particularly on the relation of bacteria to spontaneous generation.

His talks and demonstrations were among the earliest given in the United States.

In 1880 Dr. George M. Sternberg (one of the pioneer American bacteriologists, a surgeon in the United States Army, and later surgeon general) associated himself with Martin and started a bacteriological laboratory in the Physiology Building of the University. His status was that of a fellow-by-courtesy. He studied bacteriology according to the methods of Pasteur and had approximately six students working under him until the laboratory was discontinued in 1885.

In September 1885 Dr. William H. Welch arrived in Baltimore and, with Dr. W. T. Councilman as associate in pathology, set up a laboratory in two rooms on the top floor of the biological laboratory. Welch did not wait for the opening of the hospital or the medical school to start active teaching and to get research under way. The first group to assemble under him were Drs. Councilman, A. C. Abbott, B. M. Bolton, F. P. Mall, and G. H. F. Nuttall. In the winter of 1885-1886, he lectured on pathology to physicians and advanced students of biology, giving a series of nine lectures on microorganisms in disease each Wednesday from February 3 to March 31, 1886 in the Hopkins Hall. Cultures and microscopic slides of pathogenic organisms illustrated the lectures.

In October 1885 the first steps were taken toward furnishing and equipping as a pathological laboratory the Autopsy Building, a two-story building on the grounds of the Johns Hopkins Hospital. The building was opened in its entirety in October 1886; in November a course in pathology was given. It was not until the next season, during March and April 1887, that Welch gave the first systematic course in bacteriology in Maryland. In November 1987 bacteriological investigations and laboratory exercises were started. The course then included the methods of isolating and of cultivating microorganisms and the morphological and the biological properties of the most important species, particularly of the pathogenic forms.

"Some Welch Rabbits" Drawing by Max Brödel

The laboratory was supplied with a complete set of apparatus for bacteriological work. Welch was assisted by Dr. B. Meade Bolton, a former graduate student. They had a class of seven: Drs. W. D. Booker, H. T. Brooks, S. T. Earle, F. D. Gavin, F. P. Mall, C. O. Miller, and R. L. Randolph. This course continued until the opening of the Johns Hopkins Hospital in 1889, when Welch inaugurated a more complete course in pathology and bacteriology for graduates in medicine.

At this time a systematic course in bacteriology was given during the semester on Monday, Tuesday, Wednesday, and Thursday afternoons from 2:30 to 5 o'clock. No other medical school in America had similar facilities available for instruction in pathology and bacteriology, and the number of practitioners who availed themselves of these advantages attested their value. From the start there was an increasing demand for this laboratory work. Adding to the instruction given in the laboratory by Welch, Councilman, and Abbott, Welch began a course of lectures in January 1891. These three-month lectures covered selected subjects in bacteriology, especially the relation of bacteria to the infection of wounds and the historical development of bacteriology (a lecture given by Abbott).

Instruction in elementary bacteriology was included in the curriculum of the training school for nurses from its beginning, and as early as 1890-1891 Welch lectured to the senior class on disinfection in contagious diseases. Abbott's textbook, *Principles of Bacteriology,* and Nuttall's *Hygienic Measures in Relation to Infectious Diseases* were sent to the Paris Exposition of 1900 as examples of manuals used in training schools for nurses.

On October 2, 1893 the Johns Hopkins Medical School was opened with Drs. John J. Abel, William S. Halsted, William H. Howell, Henry M. Hurd, Howard A. Kelly, Franklin P. Mall, William H. Welch, and Sir William Osler as heads of the various departments. At this time the hospital's graduate work ceased, and the courses for physicians were taken over by the medical school.

During the first three months in 1894 a course in bacteriology was given, and one in pathology for the last remaining five months as part of second year's work. Thus Welch's department taught both pathology and bacteriology, recognizing that bacteriology was a major medical discipline. Maryland was among

*Because this list was compiled by Dr. Collinson about 60 years ago, many dates were left open. In his words, "the growth of the science in Maryland [has showed] contiued evidence of progress in all fields." Filling in the blanks would be a challenge for modern-day medical historians. *Editor*

the first places in the United States to make that distinction. The instruction in pathology and bacteriology was under Dr. Welch as professor of pathology, with Dr. Simon Flexner serving as associate in pathology and Dr. Bolton as associate in bacteriology. Students were expected to become familiar with the preparation of culture media; the principles of sterilization and disinfection; the methods of cultivating, staining, and studying bacteria; the biological examination of air, water, and soil; and the important species of known pathogenic microorganisms. This course has been continued with few changes until the present.

Welch also lectured on infection and immunity and, from time to time, gave special lectures on selected topics. Opportunity was offered for advanced work and special research. A limited number of trained physicians were admitted to the regular courses, and special courses were provided for physicians during May and June. This work included elementary bacteriology; sanitary bacteriology, including water and milk; technique of agglutination, haemolysis and the immunization of smaller animals. These courses were discontinued in 1907; after that time postgraduate students were admitted to the regular classes.

Since 1916 two courses in bacteriology have been offered by the medical school. General bacteriology, taught in the third trimester of the first year, is an introductory course and concerned with methods and the study of bacteria and their relation to disease. A course in serum-study and advanced bacteriology is open to a limited number of students of the third- and fourth-year classes to provide them with an opportunity to gain laboratory experience in the fundamental and recent methods of immunology.

On April 26, 1917 Welch resigned the professorship of pathology which he had held since 1884. His successor was Dr. W. G. MacCallum, professor of pathology at Columbia University, a graduate of the first class of the Johns Hopkins Medical School and later a member of the faculty. Dr. W. W. Ford, associate professor of hygiene and bacteriology and a member of the Department of Pathology since 1903, was followed by Dr. Stanhope Bayne-Jones, and Dr. Lloyd D. Felton was made an instructor. Dr. William L. Holman was the next associate professor, during 1923-1924, after which the position has been held by Dr. J. Howard Brown.

School of Hygiene and Public Health On June 12, 1916 a School of Hygiene and Public Health was established at The Johns Hopkins University through a grant from the Rockefeller Foundation. Dr. Welch became director. The Department of Bacteriology was established under Dr. Ford, the Department of Immunology under Dr. Carroll G. Bull, and the Department of Protozoology under Dr. Robert Hegner. Courses in elementary and advanced bacteriology were at first offered and later supplanted by specific courses in sanitary bacteriology, public health bacteriology, public health laboratory practice, spirochaetes and venereal infections, methods of cultivating and identifying anaerobic bacteria, and the physiology of bacteria. The courses in immunology include elementary training in serological reactions and in the principles of immunology; lectures, demonstrations, and conferences on relevant topics; and opportunities for research. Work in elementary and advanced protozoology, parasitology, and malariology is offered by the Department of Protozoology.

University of Maryland, School of Medicine Bacteriology was first taught at the University of Maryland School of Medicine as a part of the course in pathology during the 1893-89 session. One lecture a week was delivered by Dr. Charles W. Mitchell, and six hours a week in three two-hour periods were given to the laboratory work for two months in the third year. Dr. Caspar O. Miller was in charge of the laboratory work. In bacteriology the student was taught to stain and recognize the pyogenic cocci, the gonococcus, the diphtheria bacillus, and the tubercle bacillus. Hanging-drop preparations of the typhoid bacillus were demonstrated. In 1895 Miller became associate professor of histology and pathology, and at the same time bacteriology was placed in the curriculum of the second year. Two years later the laboratory work was extended to three months.

Dr. William Royal Stokes was appointed associate professor of histology and pathology in 1898, and in 1900 associate professor of pathology and bacteriology. In this latter year the laboratory course was transferred to the third year and continued throughout a semester. From that time the head of the department has been Visiting Pathologist to the University Hospital. Under Stokes the student's work load increased to include the preparation of culture media; the principles of sterilization and disinfection; laboratory technique; the morphological, cultural, and biochemical characteristics of disease-producing bacteria and their serological reaction; the results of their inoculation into animals; and the application of bacteriology to the diagnosis and prevention of disease. Lectures were given on infection and immunity.

Dr. Jose L. Hirsh succeeded to the chair in 1901. In 1902 he was made professor and held this position until the consolidation of the College of Physicians and Surgeons with the University of Maryland School of Medicine.

A new building erected on Greene Street north of Lombard to accommodate various laboratories was first occupied in the academic year 1904-1905. Prior to that time the teaching of both pathology and bacteriology was done in the Gray Building. In 1905 the laboratory course was extended to five two-hour periods each week for a semester; in 1908 bacteriology was again placed in the curriculum of the second year.

At the beginning of the school year in 1915, the College of Physicians and Surgeons became a part of the University of Maryland School of Medicine, and Dr. Stokes took the chair of pathology and bacteriology. The department was divided in 1919, and Stokes

continued teaching as professor of bacteriology and immunology.

In 1920 the School of Medicine and the other professional schools combined with the various schools at College Park to form the University of Maryland, and the control of the University passed to a Board of Regents appointed by the Governor and confirmed by the Senate. There was a reorganization of this department concurrently with the establishment of the State University. Dr. Frank W. Hachtel was appointed as full-time teacher, though Stokes remained head of the department. Instruction in bacteriology was then given in the second semester of the first year. Ten hours of laboratory work a week were devoted to the subject, supplemented by 30 lecture hours. Immunology was presented to the second-year class in the first semester in two three-hour laboratory periods a week and 16 lecture hours. The teaching of both subjects was done in the building of the College of Physicians and Surgeons. In 1924 the head of the department was placed on a full-time basis but Stokes continued teaching actively.

College of Physicians and Surgeons Bacteriology seems to have been introduced into the curriculum in the academic year of 1896-1897. At that time Dr. N. G. Keirle was professor of pathology and Dr. John Ruhrah demonstrator of bacteriology. Cultures of various pathogenic bacteria were studied. At the beginning of the session of 1899-1900, the new college building opened with its increased facilities for laboratory teaching. Two years later Dr. Stokes was appointed professor of pathology and bacteriology. The instruction was changed considerably and enlarged to include subjects comparable to those presented at the University of Maryland. At the end of the 1914-1915 session, the College of Physicians and Surgeons became an integral part of the University of Maryland School of Medicine.

Baltimore Medical College In the 1890-1891 session a brief course in bacteriology was given to the graduating class by Dr. Caspar O. Miller. This consisted of lectures and the staining and recognition of such microorganisms as the ordinary pyogenic cocci, the gonococcus, the diphtheria bacillus, and the tubercle bacillus. The next year Dr. F. W. Gavin succeeded Miller, to be followed in a year by Dr. W. T. Howard, Jr., who remained as lecturer in pathology until the end of the 1894-1895 session. During this time a laboratory course was instituted that included the study of the morphology and the cultural characteristics of bacteria. In 1895 Howard resigned and Dr. Delano Ames was appointed lecturer in pathology.

In 1896 bacteriology instruction was separated from the teaching of pathology, and Stokes became lecturer in bacteriology. The course was then reorganized and its scope considerably broadened. From this time until the amalgamation with the University of Maryland, the content of the course was little altered.

Dr. Stokes was succeeded in 1898 by Dr. Charles Potter who the following year was made associate professor of pathology and bacteriology. In 1902 Dr. T.R.W. Wilson became lecturer in pathology and bacteriology, and in 1904 Dr. Tilghman B. Marden was appointed to the chair of biology, histology, and bacteriology.

Beginning in January 1909 the course was taught in the new laboratory building at 847 North Howard Street. In 1911 Dr. F. V. Beitler became professor of pathology and bacteriology, to be succeeded the next year by Dr. Hugh R. Spencer. At the end of this academic year the school was absorbed by the University of Maryland.

Other Institutions The beginnings of bacteriology at the College and Experiment Station of the University of Maryland were closely connected with the work on animal diseases. The first mention of it is made in the catalog of instruction for 1895 in connection with a course taught by Dr. M. P. Scott known as "Sanitary Science." Subjects included air, water, and foods wholesome or injurious to health; microscopic examination of the same; and means of guarding against preventable diseases. The work seems to have been applicable to both man and animals.

The first part-time bacteriologist was added to the staff in 1898. Chemist, Charles F. Doane was appointed assistant in dairying and bacteriology. He published what were possibly the first bacteriological studies coming from this institution. Bacteriology was taught in the Department of Veterinary Science from 1903 to 1906 and from 1909 to 1914, having been dropped from the curriculum during 1906-1909. At the beginning of the academic year 1914-1915, it was taken over by the Department of Chemistry and Bacteriology, and in 1918-1919 was included as a separate department of the Animal Industry Group. Laboratory space in the Agricultural Building was obtained and equipment purchased and installed. Two courses were given that year and four in 1919-1920 when considerable time also was spent in research. In 1920-1921 a curriculum was outlined for students wishing to specialize in bacteriology, and seven courses were offered, one for graduate students only. Two more courses were added in 1921-1922, but few changes have occurred after this time.

Two courses in bacteriology were introduced by the Department of Physiology and Hygiene at Goucher College in 1918, under the direction of Dr. Lillian Welsh and later Dr. Jessie L. King. Since then these courses have dealt with nonpathogenic organisms; the bacteriology of water, milk, and foods; and consideration of important pathogens. Other undergraduate institutions in the state offering introductory courses in this science include St. John's College, St. Joseph's College, Hood College, Mount St. Mary's College, Maryland College for Women, and Morgan College.

Diagnostic Laboratories

The establishment of clinical laboratories in connection with the hospitals paralleled the development of

courses in bacteriology and pathology at the medical schools. The first clinical laboratory to be established in Maryland was probably that at the Johns Hopkins Hospital. Since then laboratories have been established in the hospitals of Baltimore City and certain counties; many private laboratories have been opened by individuals; and the chain of public health laboratories throughout the state consists of a laboratory at the Baltimore City Department of Health, a central laboratory at the Maryland State Department of Health, and five branch laboratories in various counties.

Johns Hopkins Hospital When the Johns Hopkins Hospital was opened in May 1989, Welch was appointed pathologist; Dr. W. T. Councilman, associate in pathology; and Dr. Alexander C. Abbott, assistant in bacteriology and hygiene. The work of the bacteriological laboratory, formerly carried on by the University, was assumed by the hospital September 1, 1889; the first examinations for the presence of tubercle bacilli in the sputum of patients were personally carried out by Dr. Welch. The clinical laboratory was opened in 1896 under the direction of Dr. William Osler. Here, analyses of blood were routinely made to ascertain the presence of organisms (such as malaria) and parasites. A hygienic laboratory also was equipped and made ready for practical work under the direction of Drs. Billings and Abbott. The work of this laboratory included the bacteriological examination of water. The results of original investigations in these laboratories were reported at the meetings of the Johns Hopkins Hospital Medical Society, organized by Welch October 22, 1889.

In 1897 a new clinical laboratory was erected with rooms for special research in bacteriology. This laboratory was reorganized in 1907 under Dr. Rufus Cole and his seven assistants.

The new pathological building, started in 1921, was completed during 1923, thoroughly equipped and adapted to the work of the department.

University Hospital The clinical laboratory of University Hospital was established in the summer of 1895. A microscope and a small room were given to Dr. W. I. Messick by the hospital, and he equipped this room as a laboratory. At first routine urine analyses and blood counts were made, and gastric analyses were done later. Messick, with the encouragement of Dr. Randolph Winslow, gradually extended the work and trained the resident physicians and interns in laboratory methods. When the new hospital building was completed in 1897, a room on the third floor near the amphitheater was fitted as a laboratory.

After the resignation of Messick as clinical microscopist in 1899, the laboratory examinations were made by a succession of resident pathologists. Dr. Howard J. Maldeis was placed in charge in 1907 and remained until 1920. During his regime the laboratory was expanded from one room to its present size, and the staff was increased by the gradual addition of two technicians and a "diener."

After Maldeis's resignation the laboratory was reorganized and a full-time director appointed. Dr. Paul Clough assumed this position in 1920, to be followed in 1922 by Dr. S. Lloyd Johnson. When this reorganization occurred, the surgical pathology and the postmortem examinations were transferred to the Department of Pathology of the University of Maryland School of Medicine. During the period 1920-1925, the work of the laboratory was greatly augmented; new procedures were introduced and others modified.

City (Mercy) Hospital Many of the routine bacteriological examinations, including the blood work and gastric analyses, were done for the patients in City Hospital by members of the graduating class in the clinical laboratory of the College of Physicians and Surgeons. About 1898, when this laboratory was first organized, the work was immediately supervised by Dr. Julius Friedenwald, assisted by Dr. Thomas R. Brown, Dr. Hubert C. Knapp, and Dr. Harvey G. Beck at various times. Dr. Keirle, as professor of pathology and bacteriology at the College of Physicians and Surgeons, was director of the laboratory until 1901, when he was succeeded by Dr. Stokes, who held this position until 1915. At that time the medical school merged with the University of Maryland, and City Hospital became an independent institution known as Mercy Hospital.

About 1899 a small room on the second floor of the hospital was used as a house laboratory with Dr. Herman Westphal as assistant resident physician-in-charge. The work of this laboratory was gradually extended to include sputum examination; blood counts; urine analyses; examinations for the organisms of malaria, typhoid fever, and other infectious diseases; and the Widal and Wassermann tests. All work was done by the clinical staff of the hospital. Dr. C. W. G. Rohrer was the first to be given the title of resident pathologist and served during the years 1901-1903. During this time the taking of tissue cultures at autopsy was introduced and developed. Dr. Rohrer was followed by Dr. Samuel T. Darling and Dr. Charles W. Judd. In 1919 the laboratory was reorganized and enlarged by Dr. H. C. Collenberg, who has been director since that date.

Other Laboratories A number of private diagnostic laboratories have also been conducted in Baltimore City. The one of greatest historical importance is that of Dr. Charles E. Simon. As early as 1897 Simon converted an old stable in the rear of 1306 Madison Avenue into a diagnostic laboratory, probably the first private venture of the sort in the country. About 1910 the laboratory was moved to 1734 Linden Avenue. It was closed in 1925 allowing Simon to devote his time completely to the Department of Filterable Viruses at the School of Hygiene and Public Health.

Public Health Laboratories

A diagnostic bacteriological laboratory was established by the Baltimore City Department of Health in

1896 and by the state in 1898, the combined work of the laboratories being under the direction of Dr. Stokes. This arrangement continued until 1920, when the state established a separate laboratory.

The interest of the State Department of Health in modern bacteriology apparently began in 1887 when Dr. B. Meade Bolton, assistant in bacteriology at The Johns Hopkins University, presented a paper, The Advantages of the Study of Bacteriology, at a meeting of the Maryland Sanitary Conference.

Bolton told of the different forms and sizes of bacteria, their development, their danger and usefulness, the importance of knowing that infectious diseases are caused by living organisms, what organism is concerned in each disease, and how this knowledge assisted in its prevention and control.

Dr. C. W. Chancellor, Secretary and Executive Officer of the State Board of Health, in his annual report for 1888-1889, discussed "The Theory of Fumigation and Germs" and "Biology and Bacteriology." He stated, "the germ theory explains better than any other the communication of disease through the medium of potable water" and also listed the conditions and sources from which disease germs enter milk.

On April 29, 1891 Dr. C. O. Miller presented a report to the Secretary of the State Board of Health on the biological examination of water at Cumberland. Miller, a graduate of the University of Virginia, was one of Welch's first students and lecturer on histology and pathology at the Women's Medical College, Baltimore Medical College and the University of Maryland. In the same report, Miller stated he had examined excreta from a child who had typhoid fever and added,

> From the feces I was enabled to isolate a bacillus which, when submitted to all the usual tests for establishing the identity of the typhoid bacillus presented all the morphological characteristics, modes of growth, and reactions as the typhoid bacillus.

In the annual report of the State Department of Health for the years 1892-1893 an account is given of an investigation of an epidemic of cerebrospinal meningitis in the George's Creek Valley by Dr. Simon Flexner and Dr. L. F. Barker, both fellows in pathology at Johns Hopkins University at that time. The report states:

> In Dr. Welch's laboratory, during the last few months, from two cases of meningitis complicating pneumonia, we have been able to isolate the microorganism, *Micrococcus lanceolatus.*

Dr. Barker also outlined the method and results of the bacteriological examination of a small loop of intestine from a patient suspected to have died from cholera in Cumberland. According to the report addressed to Dr. James A. Steuart, Secretary and Executive Officer of the State Board of Health in 1894, cholera bacilli were not found. This volume also contains findings of Dr. William T. Howard, Jr., from the bacteriological examinations of milk for tubercle bacilli and of exudate from the throat for diphtheria bacilli.

Baltimore City The bacteriological laboratory of the City Health Department was established during the administration of Mayor Alcaeus Hooper on July 1, 1896 while Dr. James F. McShane was Commissioner of Health. This action was taken after the Mayor had been interviewed earlier in the year by a committee from the Medical and Chirurgical Faculty of Maryland under the chairmanship of Dr. Welch. The committee suggested Dr. W. R. Stokes to head the laboratory. Dr. Stokes had just returned from Boston where he had served as the resident pathologist of the Boston City Hospital. This suggestion was adopted, and on July 1 Stokes took charge of the laboratory, which had been equipped under his direction during the preceding month. This embryonic laboratory occupied about two-thirds of one of the former classrooms of the old Scheib School on Gay Street near Lexington. The director, being the sole member of the laboratory force, was required to serve as bacteriologist, laboratory assistant, and telephone operator.

During the remaining six months of 1896 and up to 1900, bacteriological examinations were made in connection with the diagnosis of diphtheria, tuberculosis, and typhoid fever; the Widal test for the diagnosis of typhoid fever was also instituted; large numbers of milk and water samples were examined; and the laboratory also began the distribution of diphtheria antitoxin and started the culturing of diphtheria contacts.

From 1900 to 1904 inclusive, the laboratory continued the above examinations and added malaria. Some work was done in connection with the control of disinfection. The bacteriological examination of the city water supply, which had been started prior to 1900, was continued and examination of samples of ice cream was started. There was an increase in the number of examinations made from 1905 to 1909 in connection with the diagnosis of communicable diseases; also of samples of milk, water, ice cream, and other food products. In 1909 the personnel consisted of the director, two assistant bacteriologists, a laboratory clerk, three laboratory assistants, and a laboratory collector.

During the period from 1910 to 1913 inclusive, meningitis and cholera were added to the list of examinations, and typhoid vaccine was added to the list of biological products distributed. Between 1915 and 1920 the Wassermann test for the diagnosis of syphilis, the examination of smears for gonorrhea, the typing of specimens of sputum in connection with pneumonia, and the examination of brains of animals for rabies were instituted. To the list of biological

products distributed were added pertussis vaccine, meningitis curative serum, and tetanus antitoxin (both prophylactic and therapeutic).

There were marked increases both in the numbers and types of examinations made from 1920 through 1925. During these years bacteriological tests were made in connection with the diagnosis of diphtheria, typhoid, paratyphoid, malaria, syphilis, gonorrhea, meningitis, pneumonia, rabies, dysentery (bacillary and amebic), leprosy, Vincent's angina, and typhus fever. Examinations for intestinal parasites were performed. A method of testing the virulence of morphologically positive diphtheria cultures was inaugurated as was the dark-field examination for the early diagnosis of syphilis. Colloidal gold tests, globulin tests, and cell counts were made on specimens of spinal fluid. The medical examination of food handlers was introduced; the laboratory participated in this by making examinations of cultures for diphtheria and specimens of urine and feces for diseases of the intestinal tract. The biologicals distributed included diphtheria antitoxin, smallpox vaccine, typhoid vaccine, pertussis vaccine, meningitis curative serum, pneumonia vaccine, Type I pneumonia curative serum, scarlet fever serum, Schick test material, and toxin-antitoxin.

In summarizing the development of bacteriology in the Baltimore City Health Department, it may be noted that the personnel increased from one to 19; the number of examinations from 9,005 in 1900 to 75,541 in 1925; and the biological products distributed without charge from only diphtheria antitoxin and smallpox vaccine in 1900 to 10 different types in 1925. During this period considerable research work was carried on in addition to the routine work.

State of Maryland The report of Dr. J. S. Fulton, Secretary of the State Board of Health, to the Governor for the year 1897 emphasized the importance of the establishment of a State Bacteriological Laboratory, established the preceding year. On February 18, 1897 Dr. Welch addressed a conference of the Maryland Public Health Association on "Clinical and Bacteriological Diagnosis of Diphtheria" and the "Relation of Sewage Disposal to Public Health." Dr. Osler addressed the same meeting on "The Relation of Typhoid Mortality and Sewage."

Dr. Welch was appointed a member of the State Board of Health in 1898. In that year the legislature provided for the employment of a state bacteriologist to do such work in the interest of public health as the State Board of Health directed. The appropriation for this work was limited to $2,500 per year. The work was begun in June 1898 by the engagement of Dr. Stokes as bacteriologist. Systematic examinations for the diagnosis of diphtheria, typhoid fever, malaria, and tuberculosis were done free of cost to the physicians sending specimens. This work was carried on in the improvised laboratory of the Baltimore City Department of Health. By combining the apparatus and materials of the City with the apparatus and materials belonging to the state, a thoroughly well-equipped laboratory was maintained at small cost.

During the seven months covered in the report, the physicians in the counties of Maryland submitted 218 specimens to the laboratory for diagnosis, and 81 samples of water were examined. Specimens were reported as positive or negative. The report on the results of the examination of water gave the colonies per cubic centimeter and presence or absence of *Bacillus coli.* Containers for specimens were sent to various distributing agents, selected by the health officers as convenient to practicing physicians.

During 1899 Dr. Fulton called to the attention of the Board the importance of taking release cultures in cases of diphtheria before allowing the child to return to school. An assistant in bacteriology was listed among the six employees of the State Department of Health for this year. In 1900 milk was included among the materials examined for number of bacteria per cubic centimeter, presence of pus cells, and of tubercle bacilli.

Dr. Welch became President of the State Board of Health in January 1900 and stated in the report to the Governor for the next year,

> We have established 57 bacteriological sub-stations in various parts of the counties of Maryland where supplies are kept for the convenience of physicians and health officers in sending us specimens. During the present year, the amount of work done in the bacteriological laboratory was greatly increased (doubled), showing a rapidly growing demand for the aid which we furnish.

On May 1, 1907 Dr. Fulton, who had been Secretary of the Board of since September 17, 1896, resigned to become Secretary-General of the International Congress on Tuberculosis and later to become Secretary-General of the International Congress on Hygiene and Demography. He returned to Maryland in 1913 and was reappointed Secretary, and later, Director of the State Department of Health.

Dr. Marshall Langton Price succeeded Fulton and served as Secretary of the Board until his death in 1913. Dr. Price, in his first report to the Governor, stated that the original appropriation of $2,500 for bacteriological work had not been increased and that the only way in which they were able to continue the laboratory had been by a joint arrangement with the Baltimore City Department of Health. In 1908, for the first time, food examined included oysters and clams. In his report Dr. Stokes, the bacteriologist, stated: "The oyster beds and the oysters from the Chesapeake Bay and its tributaries should be examined and sanitary surveys made of its surroundings."

The number of persons employed by the state for bacteriological work was increased from two in 1909, including the chief bacteriologist, to five in 1910. The General Assembly of 1910 authorized the State Board of Health to establish five bureaus, one of which was the Bureau of Bacteriology. On June 16, 1910 the Secretary, by and with the consent of the State Board of Health, appointed Dr. Stokes the chief of this

bureau. The interest in this aspect of public health was indicated by the appointment of Dr. Willliam W. Ford as a member of the State Board of Health in 1913. At this time the force in the laboratory was increased to seven; in the following year examinations of smears for gonococci were first noted. In 1915 the expenditures of the Bureau of Bacteriology were $9,424.59 and 13, 368 specimens were examined.

During the early part of 1920, the Department of Health established a state laboratory separate from that of Baltimore City, largely as a result of the efforts of Dr. W. W. Ford. From that time Dr. Stokes devoted all of his time to the Baltimore City laboratory. The state laboratory was located at 14 West Saratoga Street, and the staff consisted of R. C. Salter, chief of the Bureau, three assistant bacteriologists, and a clerk. The marked increase in the work of the laboratory to 15,012 specimens examined in a year was stated to be due to the very much larger number of Wasserman tests for the venereal disease clinics, more extensive use of the laboratory by the state insane hospitals and penal institutions, greater interest of the physicians in laboratory work through the activities of the state and county health officers, and special efforts made by the members of the laboratory to improve service to the physicians. The number of examinations in 1921 showed an increase of 36.5 percent over that of 1920. The greatest gains were made in the detection of venereal diseases and the bacteriological examination of water supplies and of foods. In addition to the routine work, special investigations were undertaken, as a result of problems arising in the work of this and other bureaus. These included studies on the efficiency of hypochlorite disinfectants, the determination of the phenol coefficient of "sputosan" and its efficiency as a sputum disinfectant, the use of telluric acid in the isolation of diphtheria bacilli, the viability of tubercle bacilli in the effluent of the sewage disposal plant of the State Tuberculosis Sanatorium, and a comparison of media used in the isolation of the typhoid bacillus from blood.

Dr. Salter was ill during the spring and summer of 1924. On September 15 he was injured in an automobile accident and was confined to the hospital until the middle of December. During his absence Mr. Martin Frobisher, Jr. acted as Chief of the Bureau. Following Salter's death (December 5, 1925) the administrative duties were assumed by Miss Ruth T. Hummiston, and the services of Dr. S. R. Damon of the Johns Hopkins School of Hygiene were secured to assist with the work.

In 1925 there were 52,176 specimens examined; the expenditures of the bureau amounted to $24,865.83. The number of physicians taking advantage of the state laboratory facilities also showed a marked increase.

Standard methods were prescribed for most of the laboratory procedures. Accuracy in diagnosis of specimens was controlled and stimulated by the use of test specimens that were sent out from the central laboratory. During 1924 an important change was made in the manufacture of antityphoid vaccine; a study of the typhoid fever reports showed that less than one case of paratyphoid "A" was reported per year, and that cases of paratyphoid "B" were reported rarely. The laboratory continued to use the Rawling's and Mount strains of B Typhosus but discontinued the inclusion of the paratyphoid vaccines.

Following an unusually large number of cases of typhoid fever during the mid-winter months of 1924-1925 in New York, Washington, and Chicago, apparently caused by eating oysters, the State of Maryland started an intensive sanitary survey of its oyster business.

The laboratory work was divided into two parts: (1) Detection of carriers of typhoid fever who were engaged in handling the shucked stock and (2) Examination of the product itself for signs of fecal pollution. As about 5,000 persons were engaged in handling oysters in the oyster houses, it was not practical to examine stool specimens from so large a group. Specimens of excreta were obtained from all those who gave a history of having had typhoid fever and from those giving a positive Widal reaction. A total of 174 specimens was examined and only one typhoid carrier was found. In the field survey of oyster-producing waters, samples of 1,271 waters and 535 oyster samples were examined at the branch laboratory at Hurlock.

At the close of 1925, the Bureau of Bacteriology consisted of the central laboratory, located in Baltimore City, under the chief of the bureau, and five branch laboratories located in various parts of the state, each under an assistant bacteriologist. The central laboratory in Baltimore performed the routine laboratory examinations for that portion of the western shore lying east of Frederick County, the rabies examinations for the whole state, and all the Wassermann tests except those from Allegany and Garrett counties. It also received all specimens coming from the Eastern Shore territory lying north of Easton. In addition to this, the central laboratory prepared and distributed antityphoid vaccine, maintained administrative control of the branch laboratories, and rendered them such assistance as the preparation of diagnostic sera, the maintenance of stock cultures, and in some instances the preparation of culture media. Such time as was available was devoted to research and the testing of new laboratory methods.

Branch Laboratories The first branch laboratory was started August 15, 1915 in Cumberland, Allegany County, with W. A. Gunther in charge. It was through the efforts of Dr. R. H. Riley, then Deputy State Health Officer of this district, that the laboratory was made possible. He convinced the local and state authorities of the importance of local service to make his work

more effective. To carry out his recommendations, sums of money were appropriated for this purpose by the state, Allegany County, the City of Cumberland, and later Garrett County. This laboratory performed all tests, excluding rabies for Allegany and Garrett counties.

During 1921 the second branch laboratory was established in Hagerstown with Miss Zelda Hartman in charge. All tests were performed except the Wassermann and rabies examinations. This laboratory was financed by the state, Washington County, and the Rockefeller Foundation, but the work performed was for Washington County only.

A third branch laboratory was established in Hurlock, Dorchester County, with C. A. Perry in charge, where all examinations except those for rabies and the Wassermann test were performed. This laboratory was supported entirely by the State Department of Health.

In the same year, a private laboratory under contract with the state was opened in Frederick, Frederick County. Special arrangements were made with Drs. Baer and Cull to make all bacteriological examinations for diphtheria, typhoid fever, and tuberculosis in Frederick County. The purpose was to facilitate emergency work in this county.

Space was granted in the Hygienic Laboratory in Washington, DC for the use of the State Department of Health in 1925. The requisite furniture was supplied by the state, but bacteriologist Miss Hattie Alexander was at liberty to use the supplies of the Hygienic Laboratory free of charge. In return, the bacteriologist devoted all spare time to the service of the Hygienic Laboratory. This branch laboratory performed examinations on specimens from Montgomery, Prince George's, Charles, and St. Mary's Counties.

The establishment of a branch laboratory in every instance caused a large increase in the number of diagnostic examinations from the adjacent territory. Examinations of specimens for tyhoid fever, diphtheria, tuberculosis, syphilis, and gonorrhea constituted the bulk of the diagnostic work. The venereal disease work continued to increase more rapidly than all others mentioned. The division of laboratory service created a problem of administration, in that it tended to isolate the laboratory worker. The Chief of the Bureau kept in close touch with the branch laboratories through personal visits, correspondence, and daily reports from those in charge.

Contributions

A pupil of Cohnheim's, Dr. Welch has been successively professor of pathology at Bellevue Hospital Medical College from 1878 to 1884, at the Johns Hopkins University from 1884-1916, and director of the School of Hygiene and Public Health through 1925. After accepting the invitation to become professor of pathology in the university and pathologist to the Johns Hopkins Hospital, Dr. Welch went to Germany in the fall of 1884, where he attended the first course in bacteriology given in a university and studied the new bacteriology under Koch and Flugge.

In 1884 he gave his first courses in the biological laboratory at the university, and in regard to these Howard says:

> The brighter of the younger and many even of the established physicians during the next 10 to 15 years enrolled themselves in the courses in bacteriology...offered by Welch and his associates in his pathological laboratory. Fortunately, Welch's courses also were opened to undergraduates of the Johns Hopkins University who expected to study medicine. By these means, interest in the fundamental sciences in Baltimore was revived and rekindled. Young men entering medicine had opportunities to pursue them and graduates in medicine were enabled to make up their deficiencies. By 1890, Welch's students composed directly or indirectly the whole medical profession of Baltimore, for there were few so ignorant or so fossilized that they could not absorb something of knowledge so simply diffused and imparted by this clear-headed, impelling master, whose kindly manner reassured the meek and abashed the arrogant.

While associated with the graduate department of the Johns Hopkins University, Welch made important contributions to the bacteriology of infection. He gave probably the first clear-cut definition of infectious diseases in the modern sense when, in the spring of 1890 in his lectures at the Johns Hopkins Hospital, he said: "An infectious disease is any disease caused by the entrance into and multiplication within the body of pathogenic microorganisms." During this early period he noted the presence of staphylococci in the deeper layers of the skin and named the organism *Staphylococcus epidermidis albus*, showing it to be the cause of low-grade infections after surgical operations, particularly in the case of stitch abscesses.

He also published articles on the bacteriology of hog cholera, pneumonia, diphtheria, and typhoid fever, and wrote the chapter on bacteriology for Dennis's *System of Surgery*. Probably his chief contribution was the paper, "Bacillus aerogenes capsulatus Nov. Spec.," by Welch and Nuttall in 1892. The importance of these observations lay not so much in the discovery but in the fact that Welch appreciated the relation of infection from that organism to pathological conditions then ascribed to the entrance of air into the veins called emphysema and now usually called gas gangrene. Subsequently Welch and his pupils published a large number of papers on this organism.

Between 1885-1893, Dr. Welch had a considerable number of graduate students, mostly physicians, who worked on major problems of wound infection and disinfection of the skin. Among these were Dr. W. S. Halsted, later professor of surgery at the University, and Dr. Mary Sherwood, one of the pioneer women physicians of Baltimore, who was interested in methods of hand sterilization. Dr. Bolton investigated the inhibitory action of metals on bacterial growth. Dr. Nuttall, also associated with the department at this time, started to organize a course in hygiene on the basis of Pettenkofer of the Munich School of Hygiene.

Doctors MacCallum and Hastings published a paper on the *Micrococcus zymogenes*, and MacCullum also published one on the *Actinomyces asteroids*.

In Osler's clinic at the Johns Hopkins Hospital much important work was done, such as the studies of malarial fever by W. S. Thayer and others, 1886-1902; the investigation of amebic dysentery by William T. Councilman and Henri A. Lafleur 1890-1891; the finding of the microorganisms in gonorrheal endocarditis and septicemia by W. S. Thayer and George Blumer, 1896; the confirmation of the significance of the meningococcus intracellularis in epidemic cerebrospinal meningitis by Dr. Councilman in 1897; the studies of eosinophilia in trichinosis by Thayer and Thomas R. Brown, 1897-1898; and the study of malarial parasites by William G. MacCallum and Eugene L. Opie in 1897-1898. The first observation in America of *Amoeba coli* was made by Dr. Osler at the Johns Hopkins Hospital in 1890; later that year Dr. Lafleur reported a second case in which the organism was found and the first demonstration made to a medical society.

As early as 1885 Drs. Councilman and Abbott, at Bayview Hospital, confirmed Lavaran's studies on the malarial parasite and taught the resident physicians at that institution the methods of blood examination relating to diagnosis and treatment. Howard suggested that although Baltimore physicians were well grounded in the various aspects of this disease, it was not until the opening of the medical dispensary and wards of the Johns Hopkins Hospital under Dr. Osler that critical routine studies of the different forms of the malarial parasites in relation to the various types of malarial fever were regularly practiced in this city. A certain looseness in diagnosis not only between the various forms of this disease but also between them and wound infections, typhoid fever and other diseases on the part of the general practitioner began to be rectified. An important role in correcting the confusion between malaria and typhoid fever and tuberculosis was played by the bacteriological laboratory after 1900.

The work of Booker, who found streptococci in intestinal lesions in 1895 and that of Duval and Bassett in 1902, and later Howland and his co-workers, with *B. dysenteriae*, have been of far-reaching importance in the study of gastroenteritis. Booker was responsible for introducing the practice of pasteurization of milk for babies about 1892, and much of the advance in the control of cholera infantum in Baltimore has been based on his pioneer work.

The Yellow Fever Commission of 1900 was appointed and instructed by Surgeon General George M. Sternberg, who had conducted bacteriological investigations in the Physiology Building of Johns Hopkins University some years previously. Dr. Sternberg had isolated the diplococcus of pneumonia simultaneously with Pasteur, published valuable treatises on bacteriology and disinfection, and through the localization of "Bacillus X" in yellow fever as a negative find, cleared the ground for later investigators. He continued his studies of yellow fever and, during the occupation of Cuba by the United States Army, appointed the Commission that solved the problem of the transmission of yellow fever by the stegomyia mosquito. Walter Reed, who was at the head of the Commission; Jesse W. Lazear, who lost his life in the experimental study of yellow fever; and James Carroll, a member of the Commission, who submitted to an inoculation and came through successfully; were all former students of Dr. Welch. The program for the work of the Commission was outlined in Baltimore and carried out with advice from Dr. Welch.

The establishment of the Pasteur Institute in connection with the College of Physicians and Surgeons and the City Hospital of Baltimore was due largely to the efforts of Dr. N. G. Keirle, professor of pathology, assisted by Dr. John Ruhrah. A fund to inaugurate the work was raised by public subscription, as the result of a movement on the part of *The Sun* paper. Dr. Rurah, then resident physician at the City Hospital, spent two months at the Pasteur Institute in Paris, where the treatment originated, and on his return was made physician-in-charge of the Baltimore Institute. The first patient was received April 15, 1897.

Dr. Keirle was director of the Institute. Having become familiar with the new bacteriological methods, largely through his personal study and efforts, he made extensive investigations of pigeon and chicken diphtheria, of rabbit septicaemia, and of rabies in dogs, mice, rabbits, and other animals. He repeated the fundamental experiments of Pasteur on rabies and secured a fixed virus by successive passages through rabbits. In the introduction to *Studies in Rabies* (the collected writings of Keirle) Dr. Welch remarks that as head of the Institute, Keirle brought its work to the highest standard of efficiency.

Dr. William Royal Stokes, an active figure in both the fields of teaching and public health work, was graduated from the University of Maryland, School of Medicine in 1891 and did graduate work at the Johns Hopkins University and under Dr. Councilman at Harvard. After his return to Baltimore he was an instructor at Johns Hopkins, lecturer at the Baltimore Medical College, associate professor of pathology and bacteriology at the University of Maryland, and professor of these subjects at the College of Physicians and Surgeons until the merger in 1916, when he became a professor at the University of Maryland. He became director of the Bureau of Bacteriology of the City Health Department in 1896 and was in charge of all the work when the state and city bacteriological laboratories were combined during the period from 1898 through 1920.

Dr. Stokes conducted extensive surveys on water and milk pollution and was instrumental in effcting improvements in the city's water, sewers, and milk. His bacteriological findings concerning the water supply were confirmed by Dr. W. W. Ford, whose studies dealing with the Gunpowder River supply extended from 1906 through 1910. In addition to the studies of

milk and water, Stokes published numerous articles on typhoid fever, diphtheria, tuberculosis, and various phases of laboratory technique.

This research and that of the bacteriological laboratory of the Maryland State Department of Health frequently were conducted in conjunction with the Johns Hopkins University and the University of Maryland. Drs. Stokes, Hachtel, Fulton, and Stoner were frequent investigators and authors in this field.

Lack of space prevents a more detailed discussion of the advances in bacteriology made within the State of Maryland. The collected papers of Dr. Welch; the reports, bulletins, and journals of the Johns Hopkins Hospital and the School of Hygiene and Public Health, and of the University of Maryland; and the annual reports of the Departments of Health of Baltimore City and the State of Maryland are rich in such material. One striking thing about this review of the growth of the science in Maryland is the continued evidence of progress in all fields. The teaching, the diagnostic work, and the research continue to show vigorous development.

Acknowledgments

The author acknowledged his indebtedness to those who gave valuable assistance in the preparation of this history. Particular thanks to Dr. William W. Ford, for much of the information relating to the Johns Hopkins Medical School and Hospital; Dr. Frank W. Hachtel, who wrote the sections on the teaching of bacteriology at the University of Maryland, School of Medicine, the College of Physicians and Surgeons, and the Baltimore Medical College, and on the diagnostic laboratory of the University Hospital; C. Leroy Ewing, who outlined the development of the Baltimore City laboratory; and Miss Clara Councell of the State Department of Health, for assembling and arranging the material. To these and to all others, the author expressed his appreciation and gratitude.

Chronological Highlights

1880 Sternberg opens bacteriological laboratory at The Johns Hopkins University.

1880-81 Sternberg discovers and demonstrates *Diplococcus pneumonia*.

1884 Welch becomes professor of pathology at The Johns Hopkins University and pathologist to the hospital.

1885 Councilman and Abbott first American observers to discover Laveran organisms of malaria in red corpuscles of the blood.

1887 First systematic course in bacteriology in Maryland given by Welch.

1889 Johns Hopkins Hospital opened.

1890 First observation in America of *Amoeba coli* by Osler at Johns Hopkins Hospital.

1890-91 Investigation of amebic dysentery by Councilman and Lafleur.

1892 Discovery of gas bacillus (*Bacillus aerogenes capsulatus*) by Welch and Nuttall.

1893 Johns Hopkins Medical School opened.

1893-94 Course in bacteriology introduced at University of Maryland, School of Medicine.

1895 Bacteriology first taught at College and Experiment Station of the University of Maryland.
Bacillus pyogenes filiformis descried by Flexner.
Opening of clinical laboratory at University Hospital.

1896 Finding of microorganisms in gonorrheal endocarditis and septicemia by Thayer and Blumer.
Municipal bacteriological laboratory of Baltimore City opened with Stokes in charge.
Opening of clinical laboratory at Johns Hopkins Hospital.

1896-97 Course in bacteriology inaugurated at College of Physicians and Surgeons.

1897 Private diagnostic laboratory opened by Simon.
Confirmation of significance of *Meningococcus intracellularis* in epidemic cerebrospinal meningitis by Councilman.
Department for treatment of rabies by Pasteur method opened at City Hospital.

1897-98 Studies of eosinophilia in trichinosis by Thayer and Brown
Demonstration of sexual conjugation of parasite of avian malaria by MacCallum.

1898 Opening of clinical laboratory, City (Mercy) Hospital. Establishment of state bacteriological laboratory, in conjunction with work of Baltimore City. Welch appointed member of State Board of Health.

1900 Yellow Fever Commission appointed by Sternberg and work planned in Baltimore.

1913 Ford appointed member of State Board of Health.

1915 First branch laboratory of State Department of Health established at Cumberland.

1917 School of Hygiene and Public Health established by Johns Hopkins University with Welch as director.

1920 Separate central laboratory opened by State Department of Health with Salter in charge.

1921 Branch laboratory at Hagerstown.

1923 Branch laboratories opened at Hurlock and Frederick.

1925 Branch laboratory at Hygienic Laboratory in Washington.

Raymond M. Atkins MD
Med Chi's President 1989-1990

Chief of Surgery at Homewood Hospital, Dr. Atkins continues private practice and serves as Surgeon for the 97th Army Reserve Command.

As Med Chi's President, Raymond M. Atkins MD assumes office on April 14th confronting many pressing health issues that face Maryland physicians. Long an active leader in organized medicine, Dr. Atkins is familiar with the issues and is well prepared to deal with them. He is a former President and Secretary of the Baltimore City Medical Society and has served on the Executive Committee of the Medical and Chirurgical Faculty of Maryland since 1986. Dr. Atkins feels that anyone who is honored with the position of president of Med Chi, "has worked up to a leadership role and it is incumbent on him to perform in that mode. A year is not a long time to get things going. If the groundwork has not been done by the time the President takes office, anything he tries to put in position probably will not happen. It is generally a matter of seeing some of things one works toward come to fruition and being in the position to help it happen." Some of the areas in which Dr. Atkins plans to focus his energies while president are highlighted here.

Leadership

Dr. Atkins' primary goal as president is to strengthen and increase the leadership of the Faculty. "If you liken it to somebody learning to ride a bicycle, there's usually a lot of falling down and being held from behind until you get your wheels going. I see Med Chi in a similar role at the moment, in the sense that Jack Sargeant, who was a very strong influence in the organization, left it with only a small number of support-role personnel (physician or staff). We who have come after his leadership are obliged to feel our way in reorganizing the medical society, redefining leadership, and making it a strong and workable organization. That is not as simple as it sounds because there are political self-interests to be served in so doing. It is difficult, but we are learning to ride our bicycles and we are getting better at it. My intent is that this will be a very smooth, tightly-run organization in the next few years."

Membership

Dr. Atkins maintains that one way to strengthen the faculty is to increase membership. Although Med Chi currently represents approximately 7,500 physician members throughout the state,

Born in Marlinton, West Virginia, Dr. Atkins moved to Baltimore with his family in 1937. "When I came to Baltimore I might as well have been from a foreign country," Atkins said. "We moved into an ethnic neighborhood, and I really spoke a different language. Although I was a top student as a youngster in the fifth grade, I was untutored in the ways of the City. It was a foreign world. My new friends would ask, 'Are you gentile?' I'd say 'Gee, I don't know, I'll go home and ask my mother.' I still have some wonderful old friends that I grew up with in that community."

Dr. Atkins attended City College and graduated in 1945. "The United States was fighting in World War II when my class graduated, and we all were going off to military service. I went into the Navy Reserve and was still in flight training in Texas when the War was over. I was a little disappointed, because I had trained so long. I felt all dressed up with nowhere to go."

While in the Naval Reserve, Dr. Atkins accumulated two years of college credits in only nine months. When the war ended, he was accepted at the University of Maryland where he entered Medical School after only one year at the University. "That was both a blessing and a horror because I hadn't had all the chemistries that most of the guys had. For instance, I had never seen the physical chemistry book, and when I got to Medical School they reviewed it in two weeks. It was like going to Afghanistan, I didn't know the language! I thought I would die, but somehow I managed to get through biochemistry."

Dr. Atkins interned at the U.S. Public Health Service Hospital, a good learning institution, which also allowed him to support his wife Julia and their child. Following his internship he was given the choice of treating lepers in Louisiana, practicing on an Indian Reservation, or being a physician on a weather ship in the North Atlantic. He politely refused these positions, and instead opened a family practice in Chestertown. "It was wonderful," he recalls. "I was busy and with good people, and it felt as though I was doing something really worthwhile. In those days one did everything: delivered babies, treated heart attacks...the whole bit. But because I had to keep referring all the 'good' cases to someone else, I decided to get some surgical training."

Dr. Atkins returned to Baltimore and, with the aid of his old professor, he attained a surgical residency position at Church Home Hospital. Four years later he entered into practice with Drs. Owings, Chambers, and Finney. "They were all very high quality people and very kind people; I've been in practice ever since." Dr. Atkins worked in Church Home and was Chief of Staff there for six years. In 1985, he was offered a position at North Charles Hospital (now Homewood Hospital) where he is currently Chief of Surgery. In addition to his hospital duties, Dr. Atkins continues private practice, maintains an active role in the Army Reserve, and serves as Surgeon for the 97th Army Reserve Command. He is also chairman of the board of a 1,400 physician member preferred provider organization.

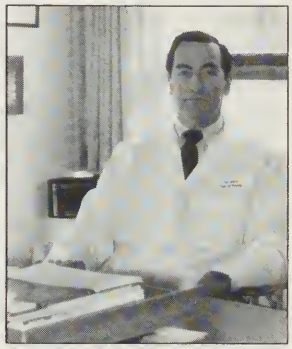
Dr. Atkins and his wife have four children and eight grandchildren. "They're all fine children," remarks Atkins. "I'm very pleased with them. One is an attorney. My oldest daughter had a marvelous education; I thought she would really produce, and she did: six children! Her husband is in infertility and reproduction. My youngest son is a robotics engineer, and my youngest daughter is very happy with a master's degree in developmental banking. It's a pretty straightforward all-American family." Dr. Atkins and his wife own and renovate property in Baltimore and also own and run a cattle breeding farm in West Virginia.

The Atkins family

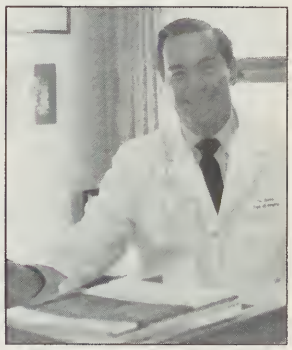
there are still many physicians in Maryland who are not represented. "The universities embrace a huge number of physicians who are strangers to the state and who do not become involved because they are more attuned to national organizations. I'm hoping we can encourage many of these very bright and very articulate people to participate; they would add a great dimension to the Faculty." Dr. Atkins is convinced that many other physician groups around the state, such as those in military installations, would welcome a place to interact and efforts should be made to include them in Med Chi's membership. "We do not welcome them and we should," remarks Atkins. "If we could recruit them in some capacity to be part of our experience, they could add a great deal from their areas."

The recruitment of new physicians to Med Chi is only part of Dr. Atkins' membership concerns; he also demonstrates a profound interest in the needs of current members. "We have been working toward providing more services for physicians, but we have to be cautious about overriding the component societies' authority as well as that of the national organizations physicians belong to. We offer insurance, referral services, and peer review, for example. These resources are among the advantages of belonging to an organization that's large enough and strong enough to truly represent the interests of the physician."

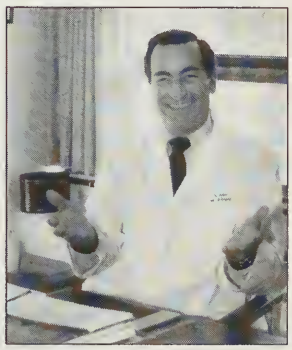
Physicians and the Legislature



"One of the prime roles of Med Chi," says Dr. Atkins, "is representing the interests of physicians in the legislature. Perhaps even more important are our lobbying efforts. In a complex state government we need to speak in a reasonable and a strong voice to support the interests of organized medicine to the benefit of both physicians and the citizens they serve, a crucial combination in today's world."



Dr. Atkins believes that Med Chi must interact with other health-related organizations in order to protect the interests of physicians. "Med Chi should maintain relations with the Maryland Hospital Association in order to promote their role in medical staff organization and we should sustain our strong representation with the Secretary of Health, whose decisions have an enormous influence and impact on us."



Major Issues Facing Physicians

During the AMA's Interim meeting in Dallas last December, Dr. Atkins observed that some of the issues of major concern to the AMA, such as the Resource-Based Relative Value Scale (RBRVS), were not presently among the biggest issues facing Maryland physicians. In his experience, Maryland physicians are concerned with some of the following priorities.

Tort Reform Although this past year has brought about reductions in liability insurance, rates are still phenomenally high relative to physicians' expenses and incomes. Dr. Atkins is concerned that insurance rates coupled with the "defensive medicine" physicians must practice to avoid legal suits will eventually lead to a physician shortage. "I don't know any physician who objects to efforts aimed at assuring good, quality care," says Atkins, "but the methods have become terribly onerous in terms of paperwork, review committees, and groups of organizations in the hospitals. This very heavy overview and its impact on malpractice insurance rates is driving a lot of physicians out of solo practices into either group practices or early retirement. More importantly, this also is preventing young people from going into medicine. Fifteen years ago we had 25 people standing in line for each position in medical school; now there are 1.4. Of great concern to all of us, these issues are influencing the practice of medicine now and will have even more dominion in future years."

Medical Staff Shortages Of major interest to Dr. Atkins is the growing crisis among hospitals. He noted that every five days a hospital in this country closes and that many hospitals must re-evaluate their financial structure in order to remain in operation. "I think we are in for a shake-up in the health care delivery industry in terms of hospitals going through financial crises," Dr. Atkins commented.

One factor that contributes to this crisis is the shortage of nurses and technicians. Dr. Atkins projects that "as we lose our trained people and their expertise, we will go through some real 'white water' in the next few years. Even so, I am still optimistic. People will continue to get sick, and somebody has to treat them; there will always be a need for physicians. Some doctors (or others in health care) will not be able to change; others who are more flexible and capable of changing to match the needs of the situation will survive well in the sense of managing to continue respectable, quality practices." Dr. Atkins added that although there are fewer physicians coming out of medical school, they are extremely bright and well

trained. "Residents, even first year residents, have so much more knowledge at their fingertips than we had," states Atkins, "that it is a little scary, but also heartening. The technology itself has advanced, and they have had to keep up with its progress. The hope of the future for medicine is in the developing technology. We will develop centers of expertise where patients go for specialized care, because every med-surg hospital in the state cannot do everything. For example, it is appropriate that people who need heart transplants go to an area that has the greatest expertise, trained personnel, and specialized equipment for cardiac care. Such specialty centers will come about out of financial necessity, but they will offer great advantages to the patient in the long run."

Future of Medicine

According to Dr. Atkins, the new federal Republican administration will have a significant impact on the health care industry. He explains that the medical community is already learning to cope with government cutbacks. "Institutions are learning to live with the fact there is no more throwaway; efficiency is absolutely necessary to survive as a hospital. Maybe this is not unhealthy. Traditionally hospital administrators have functioned in their own isolated world. Medical staffs functioned almost in opposition. Now, out of economic necessity, they are being forced to work as a group. And it is appropriate that hospital administrators, doctors, and nurses sit together to plan future directions. If they don't, then they are dead in their organization. Out of everything bad perhaps there comes some good."

Moral Direction

Dr. Atkins is also interested in developing the moral direction of faculty members. He states that physicians have a great moral responsibility to their patients and to the profession. Many young physicians, Dr. Atkins regards as having been brought through the system with a 9-to-5 job mentality. Older physicians, however, retain a "24-hours-a-day and I'll do the best I can" attitude; they care about their patients and try to respond to them the best they can. Dr. Atkins hopes that all physicians will strive to apply their highest morality and dedication to patient care. "We need that sort of strength or protection of the moral fiber upon which our profession is based."

Med Chi's Future

When asked about Med Chi's future, Dr. Atkins reiterated his goals and expressed his wish for the development of a strong unified group of physicians. However, he warned that political factions make it difficult for physicians to act as a unified force and stressed that physicians must learn to work together for the good of the Faculty. "The people who rise in organizations are those who have been willing to work and to dedicate their time and effort," commented Atkins. "Unfortunately, some of our best and brightest are not contributing...the problem is this political milieu with people who have a lot of different interests to serve. Nevertheless, I have observed over the years, whether it's a chief of service, a chief of staff, or an officer in an organization, that most individuals learn to rise above their personal interests and become statesmen. They become capable of acquiring an overview and of acting on behalf of the organization. What we need is simply a solid, smoothly run organization, competently staffed, in a sound fiscal position, and a unified membership able to count on support from their organization. Then we can put on the frills. I don't have any false sense about it all happening in a year's time, but we can work at it." ■

MARYLAND LAW REGARDING NOTICE OF PARTICIPATION IN THE MEDICARE PROGRAM

On July 1, 1985 a law was passed in Maryland requiring physicians to post a notice in their offices regarding their participation status in the Medicare program. It has been brought to our attention that some physicians are not complying with this law. Therefore, Med-Chi has developed the signs on the next 3 pages for your use. The appropriate sign should be detached and posted in your office.

The law, which is outlined in Section 14-705 of the Health Occupations Article of the Annotated Code of Maryland, states:

> If a physician is engaged in the private practice of medicine in this State, the physician shall display a notice written in English that is plainly visible to patients in the office of the physician concerning whether the physician:
> (1) Is a participating physician under the Medicare program and, therefore, accepts assignment for all Medicare claims;
> (2) Accepts Medicare assignment on a case-by-case basis; or
> (3) Does not accept Medicare assignment in any case.
>
> This requirement DOES NOT apply to a physician or group of physicians who:
> (1) Have exclusive contracts with a health maintenance organization;
> (2) Treat only the patients of the health maintenance organization; and
> (3) Agree to accept full assignment for covered services rendered.
>
> **A PERSON WHO VIOLATES ANY PROVISION OF THIS LAW IS GUILTY OF A MISDEMEANOR AND ON CONVICTION IS SUBJECT TO A FINE NOT TO EXCEED $5,000 OR IMPRISONMENT NOT EXCEEDING 5 YEARS OR BOTH.**

If you have any questions about this matter, contact the Med-Chi Government Relations Department at 539-0872 or 1-800-492-1056.

For My Medicare Patients

I PARTICIPATE IN THE MEDICARE PROGRAM
AND
ACCEPT ASSIGNMENT FOR ALL MEDICARE CLAIMS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I ACCEPT MEDICARE ASSIGNMENT ON A CASE-BY-CASE BASIS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I DO NOT ACCEPT MEDICARE ASSIGNMENT IN ANY CASE

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

The Golden Era of Microbiology: People and Events of the 1880s

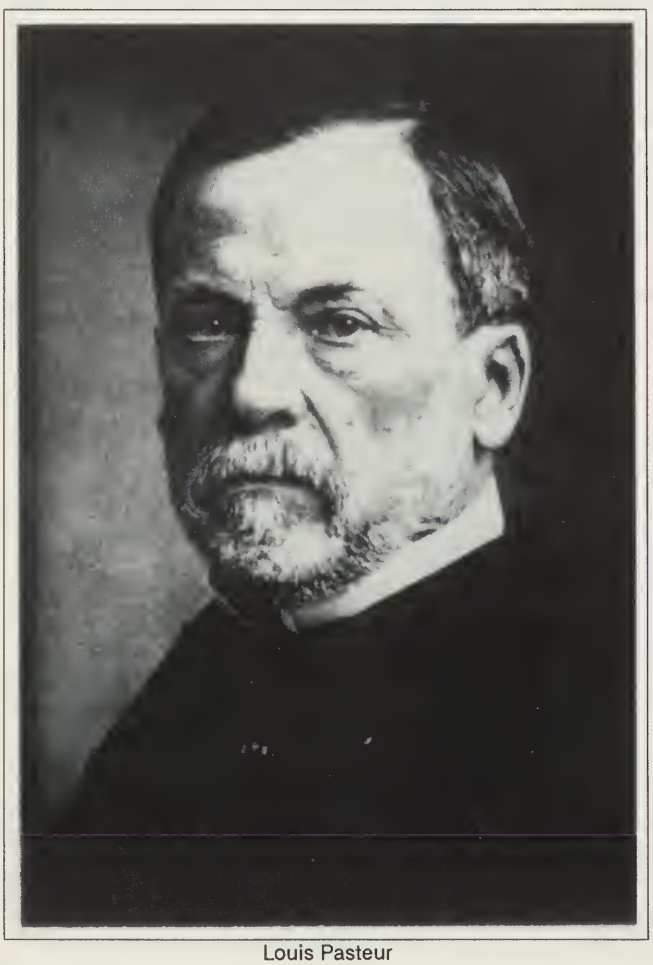
Theodore E. Woodward MD, MACP

Dr. Woodward is Professor of Medicine Emeritus, University of Maryland School of Medicine. *This material was presented in April 1988 as a lecture on the History of Medicine during the 1987-1988 Alpha Omega Alpha Series.*

While it was well known that microorganisms were present in diseased tissues as well as practically everywhere else in nature, many physicians did not consider the presence of bacteria the cause but merely an accidental accompaniment of disease.

Medical historians have placed the beginnings of medical bacteriology (or the "Golden Era" as William Welch called it), in the year 1876. It is not possible to describe the Golden Era of Microbiology without mentioning some of the important beliefs and events that preceded this dramatic era. It was well known that microorganisms were present in diseased tissues, but they were also known to occur practically everywhere in nature. One of the major concerns and points of controversy was simply "Why should we worry about microorganisms since they are around us all the time, and are present, in particular, in healthy persons without causing disease?"

In the seventeenth century the Dutch lens maker, Antonj van Leeuwenhoek perfected a method of grinding lenses from which he made a workable microscope. He spent most of his mature life describing small animals, "animalcules," in various types of fluids. Because of his remarkable observations and the descriptions of his findings, he was made a Fellow of the Royal Society of London and the Academie des Sciences of Paris.



It was Ignaz Semmelweis who, in 1847 (approximately 30 years before Pasteur and Koch discovered that bacteria caused disease) concluded that fatal fevers after childbirth were caused by the contaminated hands of doctors. It was for this reason he advocated the use of disinfectant in scrubbing the hands (chlorinated lime solution) before examining each patient. This practice significantly lowered the obstetrical mortality rate. Yet many physicians considered the presence of bacteria was not the cause of disease but merely an accidental accompaniment of disease.

In 1876 Robert Koch in Germany and Louis Pasteur in France working simultaneously (and completely independently) set about to discover the cause of anthrax. The published papers of Koch and Pasteur left little doubt that the cause of anthrax was the anthrax bacillus. The anthrax bacillus had been observed long before 1877: Davaine, in 1850, first observed it in the blood of infected animals and claimed it was the cause of anthrax. In 1881,

Pasteur responded to a serious problem of anthrax in the French livestock industry and developed his attenuated spore vaccine.

It was well known that bacteria occurred commonly in wound infections, and during the Franco-Prussian War, there were many reports in German and French literature that bacteria were to be found in wounds. Other examples illustrated the fact that microorganisms might be the cause of disease. In 1836, the Italian, Agustino Bassi, showed that a certain disease of silkworms was caused by fungi, and in 1866 to 1868, Pasteur himself showed beyond a shadow of a doubt that two other diseases of silkworms were due one, to a protozoan and the other to bacteria. These experimental studies of silkworm diseases, anthrax, and wound infections provided substantial background that microorganisms are present in the course of diseases.

Observers were unaware of factors of the physicochemical enviroment of the host that permitted the microorganism to multiply or to fail to grow.

Louis Pasteur

For years, the early observers were unaware of the fact that there were virulent bacteria that caused disease and avirulent bacteria that did not. They also were unaware of the factors of the physicochemical environment of the host that permitted the microorganism to multiply or fail to grow. In a rather remarkable way Koch and Pasteur were successful in identifying some of the factors responsible for allowing bacteria to cause disease.

In 1880, Pasteur demonstrated in a very dramatic fashion how host factors were responsible for pathogenesis. The experiment illustrates the type of simple clarity that characterized practically all this great scientist's contributions. He had the idea that the reason the chicken did not suffer from anthrax was that its body temperature was higher than that of other animals. In illustrating the germ theory of disease, Pasteur once arrived at the Academy of Medicine in Paris with three cages containing chickens; a white one, a gray one, and a black one. The white one was dead, the gray and black chickens were alive and well. All chickens had been injected with anthrax bacilli. The white chicken, after inoculation, was immersed for a half day in a cold bath and was dead. The gray chicken, also injected, was not put in a cold bath but held at room temperature and did not develop illness. The black chicken, infected with anthrax bacilli, was initially placed in a cold bath, taken out and wrapped in wool blankets and recovered. This indicated that temperature of the host alters susceptibility.

Another remarkable example of this phenomenon relates to the pneumococcus, most strains of which will not infect the rabbit because of its normal temperature of about 102° F. Dr. John Enders showed much later that only very pathogenic strains of pneumococci, such as type III, caused infection in rabbits and that most pneumococci are not pathogenic for this animal. Hence Pasteur, Koch, and others were very wise in their observations that the microbial parasite must be adjusted delicately to the physicochemical environment of the host in order to establish disease.

Tuberculosis

Koch's earlier studies founded the discipline of bacteriology, that is (a) identification of organisms by smears through drying, heating, staining, and counterstaining, (b) the value of photographing bacteria, (c) plate isolation techniques useful for cultivation and methods of identifying pure bacterial colonies on gelatin and serum, and (d) the formulation of postulates (now known as Koch's postulates) to prove etiology of illness by pathogenic microorganisms. In formulating his postulates, Koch used anthrax as a model; his work on tuberculosis came a little later.

Koch's remarkable paper of 1882, on the etiology of tuberculosis, is the classic example of design in experimentation and the impact of experimental pathology in medicine. (Remember Villemin's series of studies in 1865 revealed that infected lung tissue and

sputum from tuberculous patients caused infection in rabbits and guinea pigs with the production of tubercles.) Koch reported the isolation and demonstration of tubercle bacilli in human tissues and sputum. He pointed out the importance of the aerosol or respiratory route of infection and insisted that tuberculosis was a contagious disease from person to person and that dried sputum can be infective. He described a simple diagnostic method of staining sputum to identify the tubercle bacillus. One of the by-products of his work was the identification of tuberculin.

Robert Koch was not always correct; he insisted that human and bovine tubercle bacilli were the same. It remained for Theobald Smith, one of the greatest American biologists, to prove Koch wrong. It was Smith who clarified the differences between these two strains, and his work led to the identification in cattle of "positive reactors" and their eventual examination. This public health program greatly diminished the incidence of bovine tuberculosis in America decades before the European countries adopted this principle. Although Koch discovered tuberculin, he doggedly insisted that this fraction of the tubercle bacillus was therapeutic for humans. For several years, Koch kept his "magic bullet" a secret, and his error in clinical judgment misled physicians in many countries for several years.

Diphtheria

During this exciting period of the 1880s, repeated new biological discoveries shaped the future direction and posture of medical therapy and preventive medicine. In 1883, Edwin Klebs first stained bacteria derived from membranes of diphtheria patients and associated them as a cause of the virulent disease. A year later, F.A.J. Löffler cultivated this organism on artificial media and identified it also in the oral pharynx of asymptomatic carriers.

P.P.E. Roux and A.E.J. Yersin, working in Pasteur's laboratory in 1884, showed that the local tissue damage in diphtheria was caused by a heat-stable toxin that also circulated widely to cause further alteration and toxic changes. E.A. Von Behring's work in 1890 showed that serum from animals given diphtheria toxin previously not only protected against the disease but also was effective in treatment. These studies set the stage for purification techniques and the development of toxiods, and established other immunologic principles.

Tetanus

The early story of the prevention of tetanus parallels the diphtheria successes. Lockjaw was known to the ancients. One of Hippocrates's aphorisms was "such persons as are seized with tetanus die within four days, or if they pass these they recover."

In 1884, Nicolaier successfully transferred anthrax infection from one animal to another. S. Kitasato, of Japan, isolated the anthrax bacillus from purulent exudates in 1886 and reported the presence of spore and vegetative forms as well as nonpathogenic and noninvasive types of the bacillus. He showed that illness was caused by the vegetative form that released the toxin responsible for the subsequent disease process. The toxin was shown to cause local tetanus and systemic manifestations. Kitasoto also showed that chemicals detoxified the toxin that retained its antigenicity and produced an anatoxin (toxoid) when administered. Behring and Kitasoto collaborated in 1890 to characterize the tetanus toxin, to define the toxic unit, and also to better describe the antitoxic immunity in tetanus and diphtheria.[1]

Thus, in a short five years, fundamental features of diphtheria and tetanus were explained, and the stage was set for development of some of the most effective preventive biological vaccines now available.

Pneumonia

Laennec described pneumonia in simple,vivid language; enumerated three stages of engorgement, hepatization, and purulent infiltration (resolution) with the ausculatory signs of each; and gave a brilliant discussion of the symptoms and clinical course.[2]

It is impossible to assign direct priority of discovery of the pneumococcus as a cause of pneumonia to any one person. In 1875 Klebs reviewed the evidence in favor of lobar pneumonia as an infection. In 1880-1881 K. J. Eberth identified cocci in the lungs and meninges of a fatal case of pneumonia complicated by meningitis. Pasteur, in 1881, noted lance-shaped diplococci in the blood of rabbits previously inoculated with mucous from the oral pharynx of fatal cases. C. Sternberg, following Pasteur found that pneumococci in his own sputum were fatal to rabbits within 48 hours after subcutaneous injection. C. F. Friedlander published the first article of bacteriologic significance based on findings from stained sections of postmortem material from eight cases of lobar pneumonia. Lance-shaped pneumococci were found in tremendous numbers at the stage of red hepatization.[3] In a later study (1883) Freidlander and his co-workers identified that diplococci were encapsulated and grew the organisms in pure culture on Koch's gelatin medium.

Cholera

Robert Koch seems to dominate the early 1880s. The fifth world endemic of Asiatic cholera reached the United States, South America, Africa, and eastern Asia around this time. Koch studied the rice water stools of cholera patients in Egypt and Calcutta and, in 1883, identified the cholera vibrio. While examining a hanging drop of rice water stool, he described these organisms as resembling "swarming gnats on a Sunday evening."

Rabies

Equal credit for discovery during this era is due Louis Pasteur. Rabies was known to the ancients. After many unsuccessful attempts to transmit this "virus," Pasteur was successful in transmitting the causative agent to rabbits by injection of central nervous system tissue and spinal fluid derived from infected dogs. The initial attempt to transmit the agent with saliva was unsuccessful.[4] Within five years, the well-known panorama unfolded. This great man and his group showed the differences between the "furious" and "dumb" type of the virus and demonstrated that an animal recovered from the early symptoms was immune to later inoculation of virulent material. Rabies was produced by intracerebral inoculation. Pasteur then came on the technique of drying the infected spinal cord of the rabbit and giving small injections consisting of reconstituted dried rabbit cord and increasing the dose day-by-day.

The first patient on whom Pasteur used the new type of vaccine was Joseph Meister, a boy who had been bitten 14 times on the hand by a rabid dog. Treatment did not begin until 60 hours after the bites. Thirteen successive inoculations with rabbit cords of increasing virulence were given in the skin fold of the hypochondrium. The little boy never developed rabies. In his progress report, Pasteur recorded that over 700 patients had been treated including 30 Russians bitten by rabid wolves. Three of the wolf-bite group died, which Pasteur attributed to the greater virulence of the wolf bite compared to the dog bite.[5,6]

These milestone experiments elucidated many fundamental biological principles, not the least of which was the demonstration of change in virulence and attenuation of a virus even before viruses were clarified as microbiologic agents. Rabies is accompanied by a long incubation period after the inoculating animal bite. Hence, Pasteur surmised that immunity could be produced with a vaccine before the disease occured.

Typhoid Fever

Another series of exciting events occurred in the mid-1880s. Direct attacks were aimed at clarifying the enigma of typhoid fever. During the nineteenth century, typhoid fever and typhus fever were regarded by most as one disease with certain variations in the clinical manifestations. In 1836 W. Gerhard, a Philadelphian, for the first time distinguished between typhoid and typhus based on his concise clinical and pathological findings of six cases.[7] Much later, in 1880, Eberth described a bacterial rod and spotlike bodies in splenic tissue and mesenteric nodes of typhoid patients.[8] In 1884 Gaffky confirmed Eberth's findings with his precise bacteriologic clinical studies.[9] In 1885, Pfeiffer reported the first isolate of typhoid bacilli from stool specimens.[10] In quick order, from 1895 to 1896, Pfeiffer and Kolle[11] and Gruber and Durham[12] showed that the serum of typhoid convalescents and from animals infected with the bacillus protected other animals against lethal doses of the typhoid germ and that the protective body in the convalescent sera caused bacilli to stick together, "agglutinate." Widal reported his agglutination test in 1896.[13]

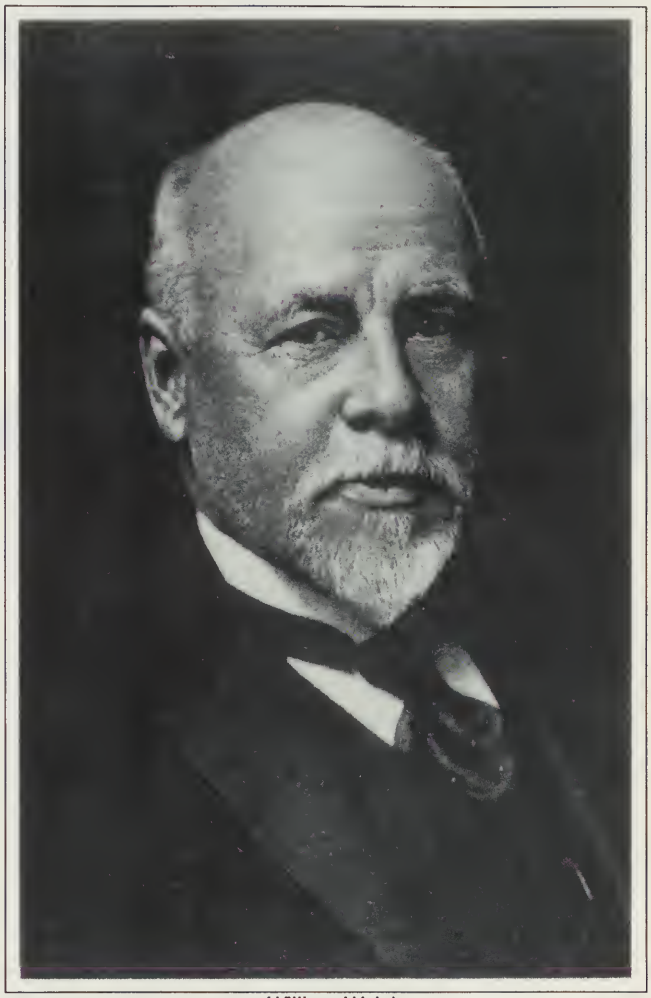
A particularly important contribution involving another gram negative infection was made by David Bruce while he was serving as a British medical officer on the Island of Malta in 1886. He reported the isolation of a micrococcus in splenic tissues and blood of British soldiers who died of a mysterious disease characterized by sweating, toxemia, and undulating febrile pattern and other manifestations. He called the organism *Micrococcus melitensis*. In 1887 B. Bang, a Danish veterinarian, reported isolating a rod-shaped organism from the placental tissues of aborting cows (Br. abortus). An authoritative monograph on undulant fever was published in 1897 by Surgeon M. Louis Hughes of Her Majesty's Forces. A serum agglutination reaction was reported in 1897 by Almoth E. Wright, a test that distinguished the disease, now called brucellosis, from typhoid fever.

Other Discoveries

A few additional microbial firsts marking this important decade include the report of A. Weil (1886) that identified four patients in Heidelberg, Germany with hemorrhagic jaundice, hemorrhage, conjunctival injection, and renal failure. They were classified as "catarrhal jaundice" at the time. Earlier (1880), D. Jean Larry (a French medical officer working with the Napoleonic armies in Cairo and the Nile Valley), noted an illness characterized by jaundice, hemorrhage, conjunctival infection, and renal failure. It was not until 1915 that Inada working in Kyushu, Japan isolated from similar patients a spirochete called *Spirocheta icterohemmorhagicae*. A year later, Hideyo Noguchi, a bacteriologist with the Rockefeller Institute, classified various spirochetes and designated them as the genus *Leptospira*.

In this same period, in 1879, A. L. S. Neisser was the first to identify the microorganism that causes gonorrhea. Despite the fact that gonococcal infections were described in early Chinese writings, in the Book of Leviticus, and the writings of Hippocrates and Galen, discovery of its cause came centuries later. In 1885 Bumm was the first to successfully cultivate the gonococcus *in vitro*. In 1881 Newberry A. S. Keyser, while a student at the University of Maryland School of Medicine, published a convincing paper confirming Neisser's observation that the gonococcus caused gonorrhea. This preceded William Welch's studies on the subject.

During a major outbreak of influenza in Europe from 1889 to 1892, Emil Pfeiffer identified an organism, *Hemophilus influenza*, obtained from the sputum of patients, which he caimed to be the cause of influenza. The influenza viruses were not specifically identified until much later in the twentieth century,



when it became quite clear that Pfeiffer's bacillus was a secondary invader during the course of epidemic influenza.

Even though G. H. A. Hanson identified *Mycobacterium leprae* in the tissues of leprous patients, the organism has not been successfully cultivated *in vitro* up until this time. An important contribution to the field was the demonstration in 1960 that *M. leprae* grows luxuriously in the mouse footpad; in 1971, the armadillo was shown to be a favorable animal host for growth of these ubiquitous organisms.

Any description of the golden era of microbiology should pay proper homage to several additional brilliant medical scientists. In 1878 to 1880, the great British tropical medicine expert, Patrick Manson, showed that the mosquito transmitted a micro filaria that caused filariasis in humans. In other studies in 1894, Manson concluded that malaria must be transmitted by the mosquito or some other suctorial insect. He postulated a cycle in the mosquito and described gametocytes, the process of exflagellation, and crescents. In his classic demonstration in 1900, infected mosquitoes were sent from Rome to London, and on August 29, allowed to bite a volunteer (Manson's son), who developed typical malaria 14 days later with tertian parasites in his blood. He was rapidly cured with quinine. Although his concepts were not proved until much later, Carlos Finlay of Cuba, proposed in 1881 that the mosquito was the transmitter of yellow fever to man. This prophecy had to wait until the Walter Reed group's work in Cuba was reported in 1900.

Theobald Smith, the great Harvard medical scientist, contributed so many things to the field of microbiology that it is hard to select any one as paramount. Texas cattle fever (also known as tick fever or southern cattle fever) had plagued the animal industry for many years. Beginning in 1889, it was Smith with Kilborne who reported a series of transmission experiments in which animals were infected by the direct application of ticks. This report, one of the classics of medical literature, established beyond question the role of the tick as the carrier of the disease. Not the least of the fruits of these experiments was the observation that the infectious agent, a protozoan, could pass in ticks from mother to offspring. This extraordinary phenomenon of insect-microbe interaction helped set the stage for Walter Reed and his group, who showed that it was necessary to incubate the virus of yellow fever in the mosquito before infection occurred. Howard T. Ricketts profited greatly from Smith's observation of transovarial transmission of an agent when he found a similar analogy in tick infection with the rickettsia of spotted fever.

Welch, Smith, Koch, Pasteur, Nicalle, and Zinsser were catalysts; they trained and stimulated others to reach their high achievements.

William Welch

This account would be incomplete if it failed to honor William Welch of Hopkins. Dr. Welch made a number of original contributions, not the least of which was his identification of the Welch bacillus. Yet, he, like Smith, Koch, Pasteur, Nicolle, Zinsser, and others, were catalysts; they trained and stimulated others to reach their high achievements. One simple but most important suggestion of Welch's to Walter Reed, in 1901, "Don't forget to filter it." This biologic principle was vital to the Cuba studies on yellow fever when it was shown that the agent would pass through a Berkfield filter.

Elie Metchnikoff, the Russian zoologist, started a ferment that persists not fully answered to the present day. In 1883, the idea of phagocytosis came to him when he was watching some mobile cells within the larvae of the starfish. In a series of papers, he commented that these phagocytes could be compared to "an army hurling itself upon the enemy microbes." In 1891, he asserted with some authority

> the premium moyens of inflammation consist of a phagocytic reaction on the part of the animal organisms. All the other phenomenon are merely accessory to this process and may be regarded as means to facilitate the access of phagocytes to the injured part.

A long battle ensued between the "humoralists," who included most pathologists and chemists on one hand, and Metchnikoff, with some support from Pasteur and Koch, on the other. Almroth Wright helped set the argument straight and pointed out that antibodies and phagocytes can cooperate with each other. Wright showed that antibody coated bacterial cells are taken up more avidly by phagocytic cells. It soon became obvious that antibacterial substances require the humoral and cellular mechanism working in full order if appropriate recovery is to ensue.

100 Years Ago

Just imagine living in the later part of the nineteenth century when infectious diseases were rampant, the causes were mysterious and often thought to be occasioned by Divine Providence, there were no vaccines to protect against the epidemic scourges, infant and child mortality was alarmingly high, the average life expectancy for adults was about 40 years, and death was accepted as a challenge of life. Yet several handsful of inspired persons with spring in their hearts and courage in their beliefs provided some of the most essential information necessary for the ultimate clarification on the mysteries of tuberculosis, typhoid fever, diphtheria, tetanus, cholera, anthrax, pneumonia, rabies, brucellosis, leptospirosis, leprosy, as well as acceptance of the germ concept of illness. The answers to many other epidemic scourges, including malaria, plague, typhus, and yellow fever, were on the brink of discovery at the turn of the century and followed in the footsteps of the remarkable 1880s. Do we not have a proud medical heritage?

Aging and Caring

Paul E. Ruskin MD

Dr. Ruskin is Chief of Geriatric Psychiatry, Baltimore Veterans Administration Medical Center and Director of Geriatric Psychiatry, University of Maryland.

I was invited to present a lecture to a class of graduate nurses who were studying the "Psychosocial Aspects of Aging." I started my lecture with the following case presentation:

The patient is a white female who appears her reported age. She neither speaks nor comprehends the spoken word. Sometimes she babbles incoherently for hours on end. She is disoriented about person, place and time. She does, however, seem to recognize her own name. I have worked with her for the past six months, but she still does not recognize me.

She shows complete disregard for her physical appearance and makes no effort whatsoever to assist in her own care. She must be fed, bathed, and clothed by others. Because she is edentulous, her food must be pureed, and because she is incontinent of both urine and stool, she must be changed and bathed often. Her shirt is generally soiled from almost incessant drooling. She does not walk. Her sleep pattern is erratic. Often she awakens in the middle of the night, and her screaming awakens others.

Most of the time she is very friendly and happy. However, several times a day she gets quite agitated without apparent cause. Then she screams loudly until someone comes to comfort her.

After the case presentation, I asked the nurses how they would feel about taking care of a patient such as the one described. They used words such as "frustrated," "hopeless," "depressed," and "annoyed" to describe how they would feel.

When I stated that I enjoyed taking care of her and that I thought they would, too, the class looked at me in disbelief. I then passed around a picture of the patient: my 6-month-old daughter.

After the laughter had subsided, I asked why it was so much more difficult to care for a 90-year-old than a 6-month-old with identical symptoms. We all agreed that it is physically easier to take care of a helpless baby weighing 15 pounds than a helpless adult weighing 100, but the answer seemed to go deeper than this.

The infant, we all agreed, represents new life, hope, and almost infinite potential. The demented senior citizen, on the other hand, represents the end of life, with little potential for growth.

We need to change our perspective. The aged patient is just as lovable as the child. Those who are ending their lives in the helplessness of old age deserve the same care and attention as those who are beginning their lives in the helplessness of infancy.

To some, perception is reality and reality does not exist outside of one's perception. This phenomenon occurs when we deal with the public, primarily because of what we know to be the inference-observation confusion. This confusion results when that which one observes and passes on to a listener is repeated by the listener as if he/she had made the same observation. In reality, the listener is only making an inference. We would do well to guard against accepting such inferences by withholding judgment until facts are assimilated. Dr. Paul Ruskin makes that point very well.

Angelo J. Troisi, Executive Director

When your patients need your best health care recommendations use your head.

Remember this hat.

When your patients need home health care remember to recommend Staff Builders. Our nurses (RN/LPN), therapists (physical/occupational/speech), medical social workers, nurses aides, home health/personal care aides, home-makers, live-in home companions are all carefully screened, bonded, insured and professional in every way. But more than that, they care. So remember Staff Builders when you recommend health care services. And remember most home health services are paid by Medicare, Medical Assistance, or Blue Cross. And that hospital and home private duty services are also available. Staff Builders personal and professional care is as close as your phone. Just give us a call if we can be of assistance.

Licensed by the State of Maryland and Federally Certified for Medicare/Medical Assistance/Blue Cross-Home Care.

Available every hour 7 days a week.

What is PDS?

PDS is a professional service company for physicians. PDS helps the physician obtain the best benefit for the disabled patient who is applying for Social Security Disability Insurance benefits or seeking vocational rehabilitation.

- **Team up with PDS** and help disabled patients get benefits sooner. You examine the patient, order tests, and furnish results to a nurse from our directory.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

In the Matter of
Nathaniel Aikens-Afful MD,
Before the
Maryland State Board of
Physician Quality Assurance

Order Terminating Probation and Reinstating License

By Order dated October 2, 1984 (the "1984 Order"), the Board of Physician Quality Assurance (the "Board"), successor agency to the Commission on Medical Discipline, found Nathaniel Aikens-Afful MD, (the "Respondent") guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated Code of Maryland* ("HO") §14-504. Specifically, the Board found that Respondent pled guilty or nolo contendere with respect to a crime involving moral turpitude whether or not any appeal or other proceeding is pending to have the conviction or plea set aside (recodified as §14-504(b)(1) of the Health Occupations Article). The Board revoked Respondent's medical license, immediately staying the revocation, conditioned upon the Respondent complying with terms and conditions (the "Conditions of Probation"). The Order further provided that after three years from the date of the Order, if the Respondent demonstrated to the Board's satisfaction that he had complied with the terms and conditions of his probation, the Board would entertain a petition for termination of Respondent's probationary status and reinstatement of his medical license. By letter received October 31, 1988, Respondent petitioned the Board for reinstatement of his license to practice medicine in Maryland. At its meeting on December 14, 1988, the Board reviewed Respondent's petition for reinstatement. Based on its review of the petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1984 Order.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent arranged for his probation officer to file written reports with the Board, verifying that he was complying with all terms and conditions of his criminal probation;
2. Respondent did not engage in activities of the type that led to his criminal conviction;
3. Respondent did not violate any other provisions of the Maryland Medical Practice Act, Health Occupations Article §14-101 *et seq.*, *Annotated Code of Maryland*; and
4. Respondent practiced fully in accordance with those standards expected of a competent practitioner of medicine in the State of Maryland.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions as set forth in the Order of October 2, 1984.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 14th day of December 1988 by a unanimous vote of a quorum of the Board:

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1984 Order are hereby **TERMINATED** and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland be **REINSTATED** without any condition or restriction whatsoever; AND IT IS FURTHER

ORDERED that this is a Final Order.

In the Matter of
Robert S. Coplan MD
Before the
Maryland State Board
of Physician Quality Assurance

Order for Summary Suspension of License to Practice Medicine

The Board of Physician Quality Assurance (the "Board") herein set forth the following background information pertinent to the context in which the instant order for summary suspension of license to practice medicine arises:

1. Based on certain information that came to its attention, the Board initiated an investigation into the Respondent's practice of prescribing and dispensing controlled dangerous substances in return for sexual favors.
2. Respondent is a physician licensed to practice medicine in the State of Maryland specializing in the practice of obstetrics and gynecology.
3. In connection with the Board's investigation, the Division of Drug Control of the Department of Health and Mental Hygiene was requested to perform a drug survey. The results of the drug survey are attached collectively hereto as Exhibit A. The results encompass five different pharmacies for the period June 1987 through June 1988.
4. The drug survey lists several drugs that are primarily mood-enhancing or mood-elevating drugs

prescribed to patients in connection with Respondent's obstetrical and gynecological practice.

5. Subsequently, a criminal investigation was initiated that resulted in charges being brought against Respondent for prescribing a controlled dangerous substance to an undercover police officer in return for sexual favors. See Statement of Charges attached hereto as Exhibit B.

6. Following the undercover investigation, in excess of 25 complaints were received by the Narcotics section of the Anne Arundel County Police Department alleging, in most instances, sexual misconduct with a patient.

Findings of Fact

Based on the information set forth above and the Exhibits hereto, the Board has reason to believe the following facts are true:

1. Respondent is a physician licensed to practice medicine in the State of Maryland.

2. Respondent is presently specializing in the practice of obstetrics and gynecology at 407 Crain Highway SE, Glen Burnie, MD 21061.

3. On December 8, 1988, Detective Kim Smith, a police officer in the Narcotics section of the Anne Arundel County Police Department, proceeded to Respondent's office located at 407 Crain Highway SE, Glen Burnie, MD.

4. Detective Smith was wearing a pager transmitter and was accompanied by two other detectives who remained in the vicinity when Detective Smith went into Respondent's office for a consultation.

5. During the course of the consultation, Detective Smith advised Respondent that she had a good relationship with her former doctor in Nevada who would give her Valium "to keep [her] going, and [she] would take care of him."

6. Respondent thereupon stated that he would prescribe the Valium without a physical examination or indication of a medical problem.

7. Respondent then wrote a prescription for 5 mg of Valium with three refills. Respondent also provided Detective Smith with three packs of Tri-Levin 21, Birth Control Pills.

8. After Detective Smith received the prescription for Valium, sexual favors were discussed.

9. Respondent was subsequently arrested and charged with unlawfully prescribing a controlled dangerous substance not in the course of his regular professional duties in violation of Article §27, 288, *Annotated Code of Maryland*. See Exhibit B incorporated by reference herein.

10. Subsequent to the undercover investigation set forth above, in excess of 25 complaints alleging sexual misconduct in the course of Respondent's practice at 407 Crain Highway SE, Glen Burnie, MD were received by the Narcotics section of the Anne Arundel County Police Department.

Conclusions of Law

Based on the foregoing facts, the Board finds that the public health, safety, and welfare imperatively requires emergency action in this case pursuant to State Government Article, §10-405(b) *Annotated Code of Maryland*.

Order

It is this 22nd day of December 1988 by the Board of Physician Quality Assurance

ORDERED that pursuant to the authority vested in the Board by the State Government Article, §10-405 of the *Annotated Code of Maryland*, Respondent's license to practice medicine in the State of Maryland be and hereby is **SUMMARILY SUSPENDED**; be it further

ORDERED that a hearing to consider this emergency suspension shall be held before a hearing examiner, pursuant to State Government Article, Administrative Procedure Act, 10-207 within thirty (30) days of the date on which this Board receives a written request for such a hearing from the Respondent; and be it further

ORDERED that this is a final Order.

ISRAEL H. WEINER MD, Chairman
Maryland State Board of Physician Quality Assurance

■ ■ ■

In the Matter of James E. Crosby MD Before the Maryland State Board of Physician Quality Assurance

Order for Summary Suspension of License to Practice Medicine

Based on information received by the State Board of Physician Quality Assurance (the "Board"), the Board hereby issues as set forth herein Findings of Fact, Conclusions of Law, and Order for Summary Suspension (the "Emergency Suspension") with regard to the license to practice medicine of James E. Crosby MD (the "Respondent").

Findings of Fact

Based on the information made known and available to the Board as of the date of the issuance of this Emergency Suspension, the Board has reason to believe the following facts are true:

1. Respondent is licensed to practice medicine in the State of Maryland.

2. Respondent possesses Maryland Controlled Dangerous Substances (CDS) Registration Number M11935, which expires June 30, 1989.

3. Respondent possesses United States Drug Enforcement Administration (DEA) Registration Number AC 8632970, which expires August 31, 1990.

4. Respondent was Patient A's primary physician for the past six (6) years for chronic obstructive pulmonary disease (COPD). In February 1988, Patient A became bedridden due to several crushed vertebrae. Patient A complained of severe back pain. Respondent treated Patient A at Patient A's home from February 1988 until April 7, 1988. During that time, Respondent prescribed Levo-Dromoran and Demerol for relief of Patient A's pain.

5. Patient A was hospitalized at Frederick Memorial Hospital from April 7, 1988 to May 4, 1988.

6. Patient A returned home on May 4, 1988 and Respondent resumed primary care of Patient A. Respondent visited Patient A at home at least every other day from May 5, 1988 until Patient A was hospitalized on November 7, 1988.

7. From May 5, 1988 until November 7, 1988, Respondent wrote prescriptions for Demerol for Patient A that Patient A's wife took to several pharmacies. Whenever Respondent prescribed Demerol for injection, Respondent instructed Patient A's wife to get the prescription filled and give the vial to Respondent at his office. Patient A's wife did as Respondent instructed and gave the vial to either Respondent or Respondent's wife at Respondent's office immediately after the prescription was filled. Whenever Respondent prescribed Demerol tablets for Patient A, Respondent instructed Patient A's wife to get the prescription filled and put the Demerol tablets on Patient A's bedside. Patient A's wife did as Respondent instructed.

8. On several occasions, while Respondent was visiting Patient A, Patient A's wife saw Respondent open the bottle containing Demerol tablets on Patient A's bedside table and put Demerol tablets into Respondent's pocket.

9. While Patient A was bedridden, he received Demerol injections from either Respondent or Respondent's wife, a nurse. No one other than Respondent or Respondent's wife gave Patient A Demerol injections. Either Respondent or Respondent's wife brought the vial of Demerol to Patient A's home for the injection. When Respondent and Respondent's wife left Patient A's home, they took the vial of Demerol.

10. In or about August 1988, Respondent's wife gave Patient A's wife a prescription for injectable Demerol written in the name of Patient A by Respondent. Respondent's wife asked Patient A's wife to get the prescription filled so that Respondent's wife could give it to another patient. Patient A's wife took the prescription to the pharmacy where it was filled. Patient A's wife gave the injectable Demerol to Respondent's wife. Patient A's wife believed that the Demerol was not intended for Patient A.

11. Based on certain information that came to its attention, the Board initiated an investigation into Respondent's practice of prescribing and dispensing controlled dangerous substances for Patient A.

12. In connection with the Board's investigation, the Division of Drug Control of the Department of Health and Mental Hygiene performed a drug survey of seven pharmacies in Frederick, MD where Respondent practices medicine.

13. The drug survey revealed that Respondent wrote the following prescriptions for Patient A:

Prescription Number	Date	Drug	Strength	Quantity
906838	02/24/88	Levo-Dromoran	2 mg	24 tablets
906978	02/29/88	Levo-Dromoran	2 mg	48 tablets

432072	10/10/88	Demerol	100 mg/ml	20 ml
915149	10/11/88	Demerol	50 mg/ml	60 ml
432216	10/13/88	Demerol	100 mg/ml	20 ml
915267	10/14/88	Demerol	50 mg/ml	60 ml
915353	10/17/88	Demerol	50 mg/ml	60 ml
915571	10/21/88	Demerol	50 mg/ml	30 ml
915679	10/25/88	Demerol	50 mg/ml	30 ml
915773	10/26/88	Demerol	50 mg/ml	60 ml
915948	10/29/88	Demerol	50 mg/ml	60 ml
916065	11/01/88	Demerol	50 mg/ml	30 ml
916126	11/02/88	Demerol	100 mg/ml	20 ml
916251	11/05/88	Demerol	50 mg/ml	60 ml

14. Patient A had a history of chronic obstructive pulmonary disease (COPD). Based on the amounts of

Demerol prescribed by Respondent, Patient A was at risk for respiratory arrest if he actually received the amount of Demerol Respondent prescribed.

15. There was no medical reason for Respondent to write a prescription for Demerol 50 mg/ml, 30 ml and Demerol 100 mg/ml, 10 ml and Demerol 100 mg, 70 tablets on July 8, 1988.

16. Levo-Dromoran and Meperidine (Demerol) are Schedule II controlled dangerous substances.

17. It is unlawful for a practitioner to prescribe any controlled dangerous substances except in the course of his regular professional duties and in conformance with the provisions of *Md. Ann. Code* art. 27, § 276 *et seq* (1987), and the standards of his particular profession relating to controlled dangerous substances.

18. Writing prescriptions for Demerol for one patient when the Demerol is intended for use by another patient is unlawful. (See *Md. Ann. Code* art. 27, §287(b) (1987).

19. Based on the above Findings of Fact, the Board has reason to believe that Respondent has violated *Md. Health Occ. Code Ann.* §14-504(a) (28) (1988 Cum. Supp.) that provides:

> Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any license if the licensee... sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes.

20. Writing prescriptions for Demerol in the amounts that Respondent prescribed as listed in paragraph 13 above for an individual with multiple medical problems poses a risk to the health, safety, and welfare of that individual.

21. Respondent's retention of a Maryland license to practice medicine and his ability to prescribe controlled dangerous substances poses a grave risk and imminent danger to the public health, safety, and welfare of the citizens of Maryland.

Conclusions of Law

Based on the foregoing facts, the Board finds that the public health, safety, and welfare imperatively requires emergency action in this case, pursuant to Md. State Gov't. Code Ann. §10-405(b) (1984).

Order

It is this 28th day of December 1988 by the State Board of Physician Quality Assurance:

ORDERED that pursuant to the authority vested in the Board by Md. State Gov't. Code Ann. § 10-405(b) (1984), Respondent's license to practice medicine in the State of Maryland is hereby **SUMMARILY SUSPENDED**; and be it further

ORDERED that on presentation of this Order, Respondent shall immediately deliver or have delivered to the Board:

1. his original Maryland license from the Board of Medical Examiners;
2. his renewal card for his license to practice medicine from the Board of Physician Quality Assurance;
3. his U.S. Drug Enforcement Administration Registration Certificate;
4. his Maryland Controlled Dangerous Substances Registration Certificate and
5. any prescription pads on which his name and DEA number are imprinted; and be it further

ORDERED that a hearing to consider this emergency suspension shall be held before a Hearing Examiner within thirty (30) days of the date on which the Board receives a written request for such a hearing from the Respondent; and be it further

ORDERED that this a FINAL ORDER.

BRIEF SUMMARY
CARDIZEM® SR
(diltiazem hydrochloride)
Sustained Release Capsules

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, (3) patients with hypotension (less than 90 mm Hg systolic), (4) patients who have demonstrated hypersensitivity to the drug, and (5) patients with acute myocardial infarction and pulmonary congestion documented by x-ray on admission.

WARNINGS

1. **Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (nine of 2,111 patients or 0.43%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
2. **Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). An acute study of oral diltiazem in patients with impaired ventricular function (ejection fraction 24% ± 6%) showed improvement in indices of ventricular function without significant decrease in contractile function (dp/dt). Experience with the use of CARDIZEM (diltiazem hydrochloride) in combination with beta-blockers in patients with impaired ventricular function is limited. Caution should be exercised when using this combination.
3. **Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
4. **Acute Hepatic Injury.** Mild elevations of transaminases with and without concomitant elevation in alkaline phosphatase and bilirubin have been observed in clinical studies. Such elevations were usually transient and frequently resolved even with continued diltiazem treatment. In rare instances, significant elevations in enzymes such as alkaline phosphatase, LDH, SGDT, SGPT, and other phenomena consistent with acute hepatic injury have been noted. These reactions tended to occur early after therapy initiation (1 to 8 weeks) and have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in some cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies, oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Dermatological events (see ADVERSE REACTIONS section) may be transient and may disappear despite continued use of CARDIZEM. However, skin eruptions progressing to erythema multiforme and/or exfoliative dermatitis have also been infrequently reported. Should a dermatologic reaction persist, the drug should be discontinued.

Drug Interaction. Due to the potential for additive effects, caution and careful titration are warranted in patients receiving CARDIZEM concomitantly with any agents known to affect cardiac contractility and/or conduction. (See WARNINGS.) Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

As with all drugs, care should be exercised when treating patients with multiple medications. CARDIZEM undergoes biotransformation by cytochrome P-450 mixed function oxidase. Coadministration of CARDIZEM with other agents which follow the same route of biotransformation may result in the competitive inhibition of metabolism. Dosages of similarly metabolized drugs, particularly those of low therapeutic ratio or in patients with renal and/or hepatic impairment, may require adjustment when starting or stopping concomitantly administered CARDIZEM to maintain optimum therapeutic blood levels.

Beta-blockers: Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated, but available data are not sufficient to predict the effects of concomitant treatment in patients with left ventricular dysfunction or cardiac conduction abnormalities.

Administration of CARDIZEM (diltiazem hydrochloride) concomitantly with propranolol in five normal volunteers resulted in increased propranolol levels in all subjects and bioavailability of propranolol was increased approximately 50%. If combination therapy is initiated or withdrawn in conjunction with propranolol, an adjustment in the propranolol dose may be warranted. (See WARNINGS.)

Cimetidine: A study in six healthy volunteers has shown a significant increase in peak diltiazem plasma levels (58%) and area-under-the-curve (53%) after a 1-week course of cimetidine at 1,200 mg per day and diltiazem 60 mg per day. Ranitidine produced smaller, nonsignificant increases. The effect may be mediated by cimetidine's known inhibition of hepatic cytochrome P-450, the enzyme system probably responsible for the first-pass metabolism of diltiazem. Patients currently receiving diltiazem therapy should be carefully monitored for a change in pharmacological effect when initiating and discontinuing therapy with cimetidine. An adjustment in the diltiazem dose may be warranted.

Digitalis: Administration of CARDIZEM with digoxin in 24 healthy male subjects increased plasma digoxin concentrations approximately 20%. Another investigator found no increase in digoxin levels in 12 patients with coronary artery disease. Since there have been conflicting results regarding the effect of digoxin levels, it is recommended that digoxin levels be monitored when initiating, adjusting, and discontinuing CARDIZEM therapy to avoid possible over- or under-digitalization. (See WARNINGS.)

Anesthetics: The depression of cardiac contractility, conductivity, and automaticity as well as the vascular dilation associated with anesthetics may be potentiated by calcium channel blockers. When used concomitantly, anesthetics and calcium blockers should be titrated carefully.

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in in vitro bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded from these studies.

The adverse events described below represent events observed in clinical studies of hypertensive patients receiving either CARDIZEM Tablets or CARDIZEM SR Capsules as well as experiences observed in studies of angina and during marketing. The most common events in hypertension studies are shown in a table with rates in placebo patients shown for comparison. Less common events are listed by body system; these include any adverse reactions seen in angina studies that were not observed in hypertension studies. In all hypertensive patients studied (over 900), the most common adverse events were edema (9%), headache (8%), dizziness (6%), asthenia (5%), sinus bradycardia (3%), flushing (3%), and 1° AV block (3%). Only edema and perhaps bradycardia and dizziness were dose related. The most common events observed in clinical studies (over 2,100 patients) of angina patients and hypertensive patients receiving CARDIZEM Tablets or CARDIZEM SR Capsules were (ie, greater than 1%) edema (5.4%), headache (4.5%), dizziness (3.4%), asthenia (2.8%), first-degree AV block (1.8%), flushing (1.7%), nausea (1.6%), bradycardia (1.5%), and rash (1.5%).

DOUBLE BLIND PLACEBO CONTROLLED HYPERTENSION TRIALS

Adverse	Diltiazem N=315 # pts (%)	Placebo N=211 # pts (%)
headache	38 (12%)	17 (8%)
AV block first degree	24 (7.6%)	4 (1.9%)
dizziness	22 (7%)	6 (2.8%)
edema	19 (6%)	2 (0.9%)
bradycardia	19 (6%)	3 (1.4%)
ECG abnormality	13 (4.1%)	3 (1.4%)

AV block second degree	2 (0.6%)	—

In addition, the following events were reported infrequently (less than 1%) or have been observed in angina trials. In many cases, the relation to drug is uncertain.

Cardiovascular: Angina, arrhythmia, bundle branch block, tachycardia, ventricular extrasystoles, congestive heart failure, syncope.

Nervous System: Amnesia, depression, gait abnormality, hallucinations, nervousness, paresthesia, personality change, tinnitus, tremor, abnormal dreams.

Gastrointestinal: Anorexia, diarrhea, dysgeusia, mild elevations of SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase, thirst.

Dermatological: Petechiae, pruritus, photosensitivity, urticaria.

Other: Amblyopia, CPK increase, dyspnea, epistaxis, eye irritation, hyperglycemia, sexual difficulties, nasal congestion, nocturia, osteoarticular pain, impotence, dry mouth.

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. Definitive cause and effect relationship between these events and CARDIZEM therapy cannot yet be established.

Miscellaneous Meetings

April 7-8 **Symposium on Geriatric Medicine** sponsored by Franklin Square Hospital Center, Georgetown University School of Medicine and Center for Aging in conjunction with the American Geriatrics Society and The Health and Education Council, Inc.; Marriott's Hunt Valley Inn, Baltimore. Fee: $275 regular, $235 residents and nurses; 13.75 AMA Cat I credits, 13.75 hours AAFP, other appropriate credits available. Info: The Health and Education Council, Inc. 301-686-3610.

April 12-16 **Third Annual Course in Critical Care Medicine**, Center for Bio-Medical Communication in cooperation with Department of Critical Care Medicine NIH, to be held at Crowne Plaza Hotel in Rockville, MD. Fee: $695; reduced rates available to physicians-in-training and allied professionals Info: S. Lisanti, Center for Bio-Medical Communication, 491 Grand Ave, Englewood, NJ 07631 (201-385-1808).

April 14 **The Clinician's Approach to Oral, Head, and Facial Pain**, cosponsored by Jefferson Medical College, the Delaware State Dental Society, The Medical Center of Delaware, and the University of Delaware. Held at the University of Delaware, John M. Clayton Hall, Newark, DE. Fee: $160/$85 student or resident. Info: S. Brocka, University of Delaware, 2800 Penn. Ave., Wilmington, DE 19806 (301-573-4400).

April 17-19 **Oral Complication of Cancer Therapies: Diagnosis, Prevention, and Treatment**, NIH Consensus Development Conference, MasurAuditorium, Warren Grant Magnuson Clinical Center, NIH, Bethesda. Info: K. Edmunds 301-468-MEET.

April 20-22 **Annual Meeting, The Virginia Society of Otolaryngology-HNS**, The Tides Inn, Irvington, VA. Info: D. Strawderman 804-353-2721.

April 28-30 **The 24th Annual Pediatric Springfest**, presented by the Department of Pediatrics, Children's Medical Center and the Office of Continuing Education in Medicine and Allied Health Professionals at the Medical College of Virginia, Virginia Commonweatlh University. Held at the Royce Hotel, Williamsburg, VA. 13 AMA Cat I credits, 13 PREP credits, 1.3 CEUs. Info: F. Burroughs 804-786-0494.

May 5 **Brief Topics in Chemical Dependency**, noon - 1:15 p.m. (lunch provided), Psychiatric Institute of Washington, 4460 MacArthur Blvd. NW, Washington. No charge: *registration required, limited to 75.* 202-965-8220.

May 8-10 **Sunlight, Ultraviolet Radiation, and the Skin**, NIH Consensus Development Conference, Masur Auditorium, Warren Grant Magnuson Clinical Center, NIH, Bethesda. Info: K. Edmunds 301-468-MEET.

May 12-13 **Annual Meeting, The Virginia Society of Ophthalmology**, Homestead Resort, Hot Springs, VA. Info: D. Strawderman 804-353-2721.

May 14-17 **1989 American Trauma Society Annual Meeting**, Crystal Gateway Marriott Hotel, Arlington, VA. Info: V. Hutchinson 800-556-7890, 301-925-8811.

May 20 **Annual Meeting Washington, DC Area Affiliate of the American Diabetes Assoc.** at the Washington Plaza Hotel, Vermot and Massachusetts Aves. Fee: $25; 3 CME credits. Info: ADA office 202-331-8303.

June 5-9 **EVMS Family Medicine Review Course - Fifth Edition**, Sheraton Beach InnVirginia Beach, VA. Info: 804-446-6140.

The Johns Hopkins Medical Institutions

All courses at the Turner Auditorium unless otherwise indicated. Sponsored Continued Education Activities for 1989. Info: Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Balto., MD 21205 (301-955-5880).

April 4-5 **In Vitro Toxicology - New Directions.** Fee: $300; 14 AMA Cat I credits or 1.4 CEU. Info: C. Kearney 301-955-2959.

April 6-7 **Diagnosis and Treatment of Neoplastic Disorders - Medical, Surgical, and Radiotherapeutic** Aspects. Fee: $250, $90 non-Maryland physicians-in-training; 14 AMA Cat I credits. Info: J. Ryan 301-955-2959.

April 10-12 **Topic in Ambulatory Medicine IV**, Harbor Court Hotel. Fee: TBA; 16 AMA Cat I credits. Info: F. Boling 301-955-2959.

April 13-14 **J.Donald Woodruff Symposium on Gynecologic Oncology** and **April 15 The Houston Everett Memorial Course in Gynecologic Urology**, the Lord Baltimore Radisson Plaza Hotel, Baltimore. Fee: both sessions - physicians $440, residents $280; Gynocologic Oncology only physicians $320, residents $200; Gynecologic Urology only - physicians $120, resdidents $80. AMA Cat I credit. Info: J. Ryan 301-955-2959.

April 24 **Ophthalmic Nursing Seminar**: Update '89. Fee: $65, $55 @ for groups of 7 or more. Info: F. Boling 301-955-2959.

April 24-26 **Toxicology Update '89: Current Concepts in Inhalation Toxicology.** Fee: $450; *limited to 50.* Info: J. Corn 301-955-2609.

May 8-13 **Topics in Clinical Medicine.** Fee: $630 physicians, $450 residents/PAs and nursepractitioners; 40 AMA Cat I credits. Info: C. Kearney 301-955-2959.

June 5-16 **Second Summer Institute in Environmental Health Studies**, sponsored by the Department of Environmental Health Sciences and the School of Hygiene and Public Health. Courses: Principles of Toxicology, Risk Communication of Environmental Hazards, Fundamentals of Occupational Medicine, Contemporary Problems in Radiation Health Sciences, Introduction to Risk Assessment and Risk Management, A Computer Model of the Cardiovascular and Pulmonary Systems Capability to Handle Toxic Problems of the Environment and/or Disease. Info: J. Corn 301-955-2609.

June 11-15 **VII ISIAN: International Symposium on Infection and Allergy of the Nose -Interational Rhinology Conference**, Stoufffer Harborplace Hotel, Baltimore. Fee: $475 physicians, $350 residents & fellows; AMA Cat I credit will be available. Info: Congress Secretariat 302-955-2959.

June 14-17 **Baltimore Perinatal Colloquium.** Fee: physicians $375, residents $200; 23.5 AMA Cat I credits, ACOG cognates available. Info: J. Ryan 301-955-2959.

June 30 **The Retinal Vascular Center 19th Anniversary Meeting - Macula**, The Wilmer Ophthalmological Institute. Fee: $200, $100 (those in training); 8 AMA Cat I credits. Info: D. Heydinger 301-955-2959.

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

Basic Practicum in Diagnostic Ultrasound: May 8-12, Aug 7-11, Nov 6-10. Fee: $500; 40 AMA Cat I credits.

Advanced Practicum in Diagnostic Ultrasound: Dec 4-8. Fee: $500; 40 AMA Cat I credits.

Advanced Obstetrics and Gynecology. Apr 5-7. Fee: $325; 24 AMA Cat I credits.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500; 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

YOCON®
YOHIMBINE HCl

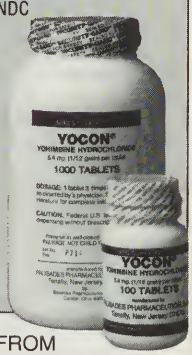
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

191st ANNUAL MEETING

Medical and Chirurgical Faculty of the State of Maryland

April 12-14, 1989

Turf Valley Hotel and Country Club, Ellicott City, Maryland

WEDNESDAY, APRIL 12, 1989

2:00 p.m.

Plenary Session - *Congressman Tom McMillen*

4:00 - 5:30 p.m.

"**AIDS: How It Will Affect Your Practice**" - *Richard S. Schulof,* M.D.,Ph.D., George Washington University Medical Center, Washington, D.C.

Sponsored by the Med Chi Committee On Aids and the Center for Health Education, Inc.

"**Overview of Gynecologic Oncology**" - *Joseph Buscema,* M.D., Assistant Professor, Obstetrics and Gynecology, Johns Hopkins, and Chief, Gynecology and Gynecology Oncology, St. Agnes Hospital, Baltimore.

Sponsored by the Obstetrical and Gynecological Society of Maryland.

"**The Psychiatric and Medical Problems of the Homeless**" - *William R. Breakey,* M.D., Associate Professor of Psychiatry, Johns Hopkins Hospital and *John A. Talbott,* M.D., Professor and Chairman, Department of Psychiatry, University of Maryland School of Medicine, Baltimore.

Sponsored by the Med Chi Committee on Mental Health and the Maryland Psychiatric Society.

"**Imaging Update For The Practicing Pediatrician**" - *Eglal Shalaby-Rana,* M.D., Instructor, Department of Radiology, Johns Hopkins Hospital and *Amy Yale-Loehr,* M.D., Assistant Professor, Department of Radiology, University of Maryland Hospital, Baltimore.

Sponsored by the Maryland Chapter, American Academy of Pediatrics and the Maryland Radiological Society.

"**Caring for the Industrial Back Pain Patient: The Roles of Myofascial Pain and Manipulation**" - *Stephen M. Levin,* M.D., F.A.C.S., Director, Potomac Back Center, Alexandria, Virginia and *Norman B. Rosen,* M.D., F.A.A.P.M.R, Medical Director, Rehabilitation and Pain Management Associates, Baltimore.

Sponsored by the Med Chi Occupational Health Committee.

THURSDAY, APRIL 13, 1989

7:15 a.m.- PRAYER BREAKFAST

"**Medical Ethics - Code or No**" - *Anne Neale,* Ph.D., Bon Secours Health System, Columbia, Md..

Sponsored by the Med Chi Committee on Medicine and Religion.

8:45 a.m. - 12:15 p.m.

"**Heart Disease 1989: New Technologies And Techniques**" - Moderator, *Frank Claudy,* M.D.
"**Lasers And Heart Disease**" - *Stuart F. Seides,* M.D., FACP, FACC
Additional topics and speakers to be announced.

Sponsored by the American Heart Association, Maryland Affiliate, Inc.

8:45 a.m.

"**The Caring Physician: Back To Basic Issues**" - *S.Spence Meighan,* M.D., Consultant To Hospitals and Medical Staffs, Portland, Oregon.

Sponsored by Medical Mutual Liability Insurance Society of Maryland.

"**Caring With Or Without Narcotics**" - *Speaker(s) to be announced.*

Sponsored by the Med Chi Committee On Drugs.

"**Physician Assistants**" - *Speaker(s) to be announced.*

Sponsored by the Maryland Academy of Physician Assistants.

"**Medicare Fraud And Abuse**" - *Martin J. Gaynes,* Esq., Wilkes, Artis, Hedrick & Lane, Washington, D.C., and *Ronald Liebman,* Esq., Washington, D.C. Moderator, *Emilio A. Bianco,* M.D.

Topics and speakers to be announced- Sponsored by the Med Chi Medicolegal Committee

10:45 a.m.

"**The Long Term Management of the Chronic Obstructive Pulmonary Disease (COPD) Patient**" - *Lewis J. Rubin,* M.D., Head, Pulmonary Division, University of Maryland School of Medicine, Baltimore.
"**Pulmonary Rehabilition**" - *Edward W. Schaefer,* M.D., Chief, Pulmonary Medicine, Liberty Medical Center and *Bernard Farrell,* M.D., President, Medical Staff, Howard County General Hospital, Columbia, Md..

Sponsored by the Maryland Thoracic Society.

"**Breast Reconstruction**" - *John Bostwick, III,* M.D., Professor of Surgery, Division of Plastic Surgery, Emory University School of Medicine, Atlanta.

Sponsored by the John Staige Davis Society of Plastic Surgeons of Maryland.

"**Treating The Musicians Among Your Patients**" - *Richard Lederman,* M.D., Ph.D., Director, Medical Center For Performing Artists, Cleveland Clinic Foundation, Cleveland.

Sponsored by the Med Chi Music Medicine Clearinghouse.

"**The Pen Is Mightier Than The Sword - Prescription Drug Abuse**" - *Nelson H. Hendler,* M.D., Clinical Director, Mensana Clinic, Stevenson, Md..

Sponsored by the Med Chi Committee On Alcoholism and Clinical Dependency, Maryland Academy of Family Physicians, and the Maryland Psychiatric Society.

"**The Primary Care Physician's Role In The Management Of Acute Coronary Disease**" - *Henry Meilman,* M.D., Union Memorial Hospital, Balto. and *Carl L. Tommaso,* M.D., University of Maryland, Baltimore.

Sponsored by the Maryland Academy of Family Physicians.

2:00 p.m.

"**Cardiopulmonary Resuscitation - Every Patient's Right - Or Exercise in Futility?**" - *Rev. Robin Whitlock,* Baltimore, *Peter E. Dans,* M.D., Baltimore, and *Michael Ryan,* Esq., Baltimore.

Sponsored by the Med Chi Professional Ethics Committee and the Committee On Medicine and Religion.

"**Lipid Measurement Issues for Clinicians**" - *Gerald Cooper,* M.D., Ph.D., Research Medical Officer, Division of Environmental Health and Injury Control, Centers for Disease Control, Atlanta and *Jack DeBoy,* Ph.D., Chief, Division of Laboratory Licensure and Training, Maryland Department of Health and Mental Hygiene, Baltimore.

Sponsored by the Maryland Commission on High Blood Pressure and Related Cardiovascular Risk Factors.

"**Long Term Outcome And Management Of Chronic Urticaria**" - *Gary Rachelefsky,* M.D., Clinical Professor Of Pediatrics, UCLA Medical Center, Los Angeles.

Sponsored by the Maryland Asthma And Allergy Society.

"**What To Do With The Opposite Breast**" - *Elmer Hoffman,* M.D., Baltimore, *Edward Lewison,* M.D., Baltimore and *John Bostwick, III* M.D., Professor of Surgery, Division of Plastic Surgery, Emory University School of Medicine, Atlanta.

Sponsored by the Maryland Breast Society.

"**Physician Quality Assurance Board**" - *Speaker(s) to be announced.*

"**Rheumatologic Problem Solving In Daily Practice: Three Illustrative Cases**" - *Peter A. Holt,* M.D., Baltimore; *Mary Betty Stevens,* M.D., Baltimore and *Carol A. Ziminski,* M.D., Baltimore.

Sponsored by the Maryland Society For Rheumatic Diseases.

4:00 p.m.

"**Are Arterial Blood Gases Obsolete: Reflections On The Evolution Of Patient Monitoring**" - *John W. Severinghaus,* M.D., Professor of Anesthesiology, Anesthesia Research Center, San Francisco.

Sponsored by the Maryland Society of Anesthesiologists and the Baltimore Critical Care Society.

"**Issues Of Transferring Patients From Nursing Homes To Hospitals**" - *Mark Waymack,* Ph.D., Evanston, Illinois.

Sponsored by the Med Chi Long Term Care and Geriatrics Committee

"**Stroke In The Young**" - *Robert G. Hart,* M.D., M.P.H., Moderator, *Steven J. Kittner,* M.D., M.P.H.

Sponsored by the American Heart Association, Maryland Affiliate, Inc., Research, Medical and Community Programs Department.

"**Clinical Application Of 201 Thallium (STECT) Imaging In Myocardial Disease**" - *Jamshid Maddahi,* M.D., Associate Professor of Medicine, UCLA School Of Medicine and Director Of Nuclear Cardiology Research, Cedars-Sinai Medical Center, Los Angeles.

Sponsored by the Maryland Society Of Nuclear Medicine.

"Pain And Performance - Musculoskeletal And Neurologic Problems In The Performing Arts" - *Yasoma Challenor,* M.D., Professor, Department of Rehabilitation Medicine, Columbia University, New York.

Sponsored by the Maryland Society of Physical and Rehabilitation Medicine.

FRIDAY, APRIL 14, 1989

8:45 a.m. - 12:15 p.m.

"ICU Management: A Cooperative Effort" - *Rhonda Fishel,* M.D.,Assistant Surgeon-In Chief, Sinai Hospital, Baltimore.

"Update On Cataract Surgery" - *Charles Castoro,* M.D., Private Practice, Baltimore.

"Surgery For Carcinoma Of The Pancreas" -*Anthony L. Imbembo,* M.D., Surgeon-In-Chief, University of Maryland Hospital, Baltimore

"Early Reconstruction For Breast Cancer" - *Lauren Schnaper,* M.D., Department of Surgery, University of Maryland Hospital, Baltimore

"Current Management Of Esophageal Varices" - *Robert Bailey,* M.D., Department of Surgery, University of Maryland Hospital, Baltimore

"Adrenal Endocrine Update" - *Donald S. Gann,* M.D., Department of Surgery, University of Maryland Hospital, Baltimore

Sponsored by the Maryland Chapter of the American College Of Surgeons.

8:45 a.m.

"Alzheimer's Disease: Caring After The Diagnosis" - *Paul S. Rhodes,* M.D., Crofton, Md.

Sponsored by the Alzheimer's Association, Baltimore Central Maryland Chapter.

"Small Area Variations: Large Consequences" - *Peter E. Dans,* M.D., Office of Medical Practice Evaluation, Johns Hopkins Hospital, Baltimore.

Sponsored by the Med Chi Committee On Small Area Variation.

"Reanimation of the Paralyzed Face Without the Facial Nerve" - *Mark May,* M.D., F.A.C.S., Clinical Professor, Department of Otolaryngology Head and Neck Surgery, University of Pittsburgh School of Medicine.

Sponsored by the Maryland Society of Otolaryngology Head and Neck Surgery.

"Next Button Please - A Glimpse At Computer Assisted Teaching Techniques For the 1990s" - *H. G. Oster,* M.D., Baltimore and *Darrell Rigel,* M.D., Clinical Assistant Professor of Dermatology, New York University Medical Center, New York.

Sponsored by the Med Chi Continuing Medical Education Review Committee.

"Emergency Medicine: Character Of An Evolving Specialty" - *Robert K. Anzinger,* M.D., F.A.C.E.P., Riverforest, Illinois, President-Elect, American College of Emergency Physicians.

Sponsored by the Maryland Chapter, American College of Emergency Physicians.

10:45 a.m.

"Coping With Stress In The Physician's Family" - *Penelope Ziegler,* M.D., Medical Director, Bethany Center, Bethany , Pennsylvania.

Sponsored by the Med Chi Committee On Physician Rehabilitation.

"Orthopedics Overseas" - *Kirby Von Kessler,* M.D., Baltimore, and *J. David Thompson,* M.D., Baltimore.

Sponsored by the Maryland Orthopaedic Society.

Directions to Turf Valley Hotel and Country Club:

Baltimore
Take I-695 to exit 16, I-70 west toward Frederick. Follow I-70 to the Marriotsville Road exit. Turn left on Marriotsville to the first stop sign. Turn left on Route 40, and go 7/10 mile to Turf Valley Road. Turn left and go to the Turf Valley Country Club entrance on your left.

Washington
Take Route 29 to I-70 west and use the Baltimore directions to Turf Valley.

Annapolis
Take your shortest route to I-695 and use the Baltimore directions to Turf Valley.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

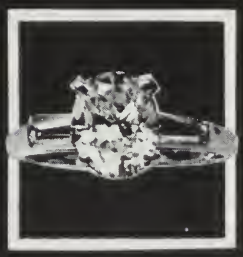
Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.



Call 296-1000 for the facilities in your practice area.

MED PAY *Announces Insurance Processing Breakthrough*

"Physicians Receive Payment Today For Patients Seen Yesterday"

The **MED**ical **PAY**ment Services of Maryland, Inc. program has completely changed the way physicians receive their hard earned fees. **MED PAY** will convert existing receivables into immediate cash and reserves. The doctor then turns over all insurance claims and patient billings for processing by **MED PAY. MED PAY** does all of the rest. In turn, the doctor receives payment today for patients seen yesterday. It really is just that simple.

We know that this may sound too good to be true. So let us prove to you how this unique program can make a dramatic difference to the physician, their practice, and their patients. To set up an appointment for more information, call **828-5050.**

MED PAY is cost effective — especially for smaller practices of 1-5 physicians

MEDical **PAY**ment Services of Maryland, Inc. 1300 York Rd., Suite 150 • Lutherville, Md. 21093

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of $678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor:

American City Bldg., Suite 307
10227 Wincopin Circle
Columbia, Maryland 21044

(301) 997-3526/4204

ARMY MEDICINE. BE ALL YOU CAN BE.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

Contraindications: VASOTEC® (Enalapril Maleate, MSO) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See OOSAGE ANO AOMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See OOSAGE ANO AOMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and OOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy—Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies in pregnant women. VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 298/ patients.

Hypertension: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

Heart Failure: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and OOSAGE ANO AOMINISTRATION), prostate hypertrophy.

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared after discontinuation of therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation ot therapy in 1.9% ot patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Dther (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) It the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Oosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance >30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Oosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart failure patients with hyponatremia (serum sodium <130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Caring with Excellence

A Choice.
Just what the doctors ordered.

What's right for a colleague is not necessarily right for you. Princeton Insurance Company knows a single policy can't meet the professional needs of every physician. That's why we offer options to let you build an insurance program with coverages tailored to your individual needs.

Option 1: *Occurrence Plus* professional liability
Option 2: *Occurrence Plus* professional liability and general liability
Option 3: *Occurrence Plus* professional liability and general liability and property coverage to protect your practice and office premises.

And **you decide** whether policy limits apply only for you or are shared among the professionals in your practice.

Choose Princeton and the choices are yours.

Cover: The Artist Explains

The computer is rapidly becoming a valuable and irreplaceable ally to the physician in the diagnosis and practice of medicine. The image that appears in the monitor depicts a new concept in computer technology that will revolutionize how the physician deals with the human form.

Through the use of image processing the physician can select any part of the anatomy to appear on the monitor in a variety of perspectives. It allows graphic reconstruction of the form by first displaying the area of the body chosen in a three dimensional format. Using computer animation the viewer is able to remove one layer of tissue or bone at a time. The physician could use this process if a patient came into the emergency room after being badly injured in an automobile accident. The computer-generated images help the surgeon visualize how the patient's entire face could be reconstructed.

The image on the computer screen represents the melding of computer and physician as partners in the everchanging world of computerized medical technology.

Lanier Business Products

PROFILE

Practi-Care Medical Systems
The One-Stop Practice-Management Solution

Lanier Business Products has been a leader in supplying office-automation systems to the medical office environment for more than 50 years. Medical practices have come to recognize Lanier's name for excellence in product, service, and support. The same can be said for Practi-Care Medical System.

Practi-Care Medical System was designed to help you manage your practice like a business, but never lose track of the fact that your business is the delivery of care to your patients. Lanier recognizes the need to implement a computer system without the concern of software flexibility, hardware dependability, and especially the financial stability of the company backing the system. Lanier offers a total One-Stop solution—Lanier manufactures the hardware and provides the software, service, and support for the entire Practi-Care system.

complete practice-management software

Practi-Care Medical System is a complete program designed to help you in all areas of managing your practice, including account information, collections, and practice analysis. The software allows you to set up and have quick reference to accounts according to guarantor, patient, or third parties, and makes the collections process much easier with the ability to add special remarks to the accounts receivable entries. Practi-Care's standard reports provide a thorough evaluation of your practice. Practi-Care also cuts down on clerical work by automatically printing insurance forms or sending claims electronically.

rapid data entry

New patient data can be entered faster with Practi-Care than other systems. Choice Rings, which are like multiple-choice questions, allow for rapid data entry when there is a limited number of answers, such as "male" or "female." A simple press of the space bar answers the question and immediately brings up the next entry.

easy menu selection

Practi-Care Option Windows make it easy to move through the system. This eliminates the need for the user to constantly return to the Main Menu in order to select the next program they want to use. Option Windows are available with the touch of a key, and present up to eight menu selections customized to your practice.

■ **Overlapping Menus**—Most computer systems utilize a menu system in which experienced and inexperienced users alike must laboriously choose from all of the items on the main menu to find the task they wish to use. Practi-Care's Overlapping Menus allow users to logically step themselves through the selection process. The previous menu selection is on the screen as the new menu appears, showing "where you have come from." The overall result is that users can use the system easily from the very first day.

■ **Efficient Menu Bypass**—As a user becomes more familiar with the Practi-Care system, time-saving shortcuts can be used to make the process of updating records more efficient. For example, a menu titled REGISTER A PATIENT VISIT, can have a "nickname" setup, such as "RPV." The experienced user can then open the menu by simply entering "RPV," rather than accessing it through menu selections.

clear presentation of information

Lanier feels that using a computer system shouldn't be a strain. Practi-Care reduces strain through the use of large 14-inch, *color* computer screens. Characters on this type of screen appear 34% larger than on most terminals. The system not only has color, but really *uses* it to make the system easier to use.

dynamic HELP windows

Lanier has always been known for outstanding after-the-sale service and support. This tradition is enhanced in Practi-Care with the use of HELP windows. If you need help in a section of Practi-Care, a simple press of the HELP key will instantly access the answer you need. Practi-Care's HELP function is dynamic in that the solution window does not cover up the area about which you were asking. Practi-Care is also careful not to "overhelp."

unique search function

Soundsearch, a revolutionary Practi-Care feature, allows searches by simply entering a partial phonetic spelling of patient names, diagnosis, procedure, etc. Soundsearch makes a *phonetic* match such as ROOM, for the diagnosis RHEUMATISM.

dependable hardware

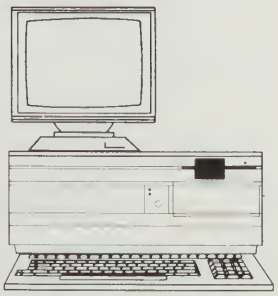
Your investment in Practi-Care is enhanced by the best price/performance, most advanced hardware available on the market. Lanier systems range from small, one-station, IBM-compatible Personal Computers for smaller practices to large, multiuser, multitasking systems for large group practices. Lanier hardware and Practi-Care software is fully upgradable so that your investment today is fully utilized as you expand your system in the future.

The Lanier Concept 4200 is a true multiuser, multitasking computer for small to medium-sized practices at a very affordable price.

The Lanier Concept 5200, the most technologically advanced microprocessor-based system in the marketplace, provides a multiuser, multitasking system that has the power of a minicomputer at a microcomputer price. It maintains the performance you require, even as you add terminals, printers, and other peripherals.

The Lanier Concept 5300 provides a system that can accommodate the largest of practices, ensuring a growth path for your organization.

reliable service and support



Lanier offers an extensive network of local service and support centers, with a reputation for excellence in the medical-office marketplace. Rapid response for hardware and software problems can best be handled by a turnkey vendor with a local presence.

Offices nationwide, with our factory-trained engineers and support personnel, provide the finest in service and support. Our satisfied customers attest to Lanier's commitment to making your installation a success.

All Lanier Practi-Care systems are backed by the full resources of Lanier, a multi-billion-dollar, national company with a local presence. Our medical office specialists will be happy to conduct a no-cost, no-obligation survey to determine your practice's needs.

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 561-0525. When it comes to curing practice management problems, we are the specialists.

New ACIP Recommendations for Measles Outbreak Control: Implementation in Two Maryland High Schools

Since measles vaccine was introduced in 1963, the reported incidence of measles has decreased 99%, and indigenous measles transmission has been eliminated from most of the country. However, importations of measles are frequent and the risk of exposure still exists, particularly for young persons who attend high school or college or who travel abroad.

Two major types of outbreaks of measles have occurred recently in the United States: those among unvaccinated preschool aged children, including children younger than the recommended age for routine vaccination (i.e. 15 months); and those among vaccinated school aged children. Large outbreaks among unvaccinated preschool-aged children have occured in several inner-city areas. Many outbreaks in the United States have occurred among children in schools where vaccination levels are above 98%. Generally, attack rates in individual schools have been low (1% - 5%) and the calculated vaccine efficacy has been high. Primary vaccine failures have played a substantial role in transmission. In many of these outbreaks, children who had been vaccinated at 12-14 months of age had a higher attack rate than those vaccinated at older ages.

Because the majority of outbreaks are occurring in these age groups, the Immunization Practices Advisory Committee (ACIP) has recently revised the recommendations for measles control in two groups:

1. Geoghraphic Areas With Recurrent Measles Transmission Among Preschool Children.

The ACIP recommends that a routine two dose vaccination schedule for preschoolers be implemented in areas with recurrent measles transmission (i.e. counties with more than five reported cases among preschool aged children during each of the last five years). **Note: No counties in Maryland have reported 5 or more cases of measles in preschool children in each of the last 5 years.** The first dose of measles vaccine should be administered at age 9 months or at the first health care visit thereafter. Infants vaccinated before their first birthday should receive a second dose at or about 15 months of age. Single antigen (monovalent) measles vaccine should be used for infants < 1 year of age, and measles, mumps, and rubella (MMR) for persons vaccinated on or after the first birthday. Although some data suggest that children who do not respond to the first dose administered at a young age may have an altered immune response when revaccinated at an older age, there are no data to suggest that such children are not protected from measles.

2. Outbreak Control Strategies for School-Based Outbreaks.

Because of the prominent role that persons with primary vaccine failure are playing in measles transmission, the ACIP recommends the institution of some form of revaccination in outbreaks that occur in junior or senior high schools, colleges, universities, or other secondary institutions. In an outbreak, the ACIP recommends that, in affected schools as well as unaffected schools at risk of measles transmission from students in affected schools, all students and their siblings who received their most recent dose of measles vaccine before 1980 should be revaccinated. This date was selected for several reasons: 1) this strategy will capture almost all students vaccinated between 12 and 14 months of age, a group known to be at increased risk of primary vaccine failure, since the recommended

age for routine vaccination was changed from 12 to 15 months in 1976; 2) it may be easier to identify students by year of vaccination than age at vaccination; and 3) in some outbreak investigations, students vaccinated before 1978-1980 have been found to be at increased risk for measles. This is not felt to be due to waning immunity but rather to a higher rate of primary vaccine failure in persons vaccinated before that time. This higher risk may be due to different reasons, including less than optimal vaccine storage and handling or to the greater lability of the measles vaccine manufactured before a new stabilizer was used in 1979. While the exact date has not been determined, 1980 is a conservative cutoff. If all students vaccinated before 1980 cannot be revaccinated, then persons vaccinated before fifteen months of age should be targeted.

Recent Outbreaks

Between January 1, 1989 and March 20th 1989, nine states (California, Illinois, Ohio, Kansas, Missouri, New Jersey, North Carolina, Rhode Island, and Texas) and Puerto Rico had significant outbreaks in preschool children and in college aged persons. These outbreaks ranged from 15 - 1255 cases of measles. One outbreak of particular interest is presently occurring in Houston, Texas. As of 20 March 1989, 1255 cases have been reported in children and young adults. Approximately 20-25% of the cases have been hospitalized with complications and 5 deaths have occurred in children ranging in age from 13 months to 21 years.

Maryland Outbreaks

Recently, measles outbreaks have occurred in two Maryland high schools. In School #1 the source of the outbreak was a student who had traveled to Disney World, a major attraction for international tourists. The source of the outbreak in School #2 was a student who acquired measles while on a school trip to Italy. School #1 had two laboratory confirmed cases and School #2 had 4 cases, with at least one pending case as of 20 March 1989.

A review of all immunization records was conducted in each school by the health department staff. Each child was classified into one of three categories

- Category 1- Vaccinated prior to 15 months of age
- Category 2- Vaccinated after 15 months age but prior to 1980
- Category 3- Vaccinated after 15 months of age and after 1979.

Table 1 shows the results of the record review in the two outbreak schools.

In each school a modified version of the new recommendations for outbreak control measures for school-based outbreaks was implemented. Potentially susceptible students were defined as students in either Category 1 or Category 2. The following recommendations were made: Category 1 students were required to be revaccinated in order to continue to attend school; and Category 2 students were advised to be revaccinated but were not to be excluded from school if they were not revaccinated.

Immunization clinics were held at the schools and vaccine was offered to Category 1 and 2 students. Thirteen hundred twenty-two (1322) measles immunizations were given at School #1 and five hundred fifty-three (553) measles immunizations were given at School #2. Prompt epidemic control measures when the outbreak was first recognized prevented many more potential cases at School #1. School #2 is still under intensive surveillance for additional cases as of 20 March 1989.

Role of the Health Care Provider

Health care providers should suspect the diagnosis of measles when any patient presents with fever and a rash present. Any patient with

- Fever 101 Farenheit
- Generalized rash of 3 or more days duration, and
- One of the following: cough, coryza, conjunctivitis,

Table 1. Measles Vaccination Status of Students in Two Maryland High Schools

Vaccination Age or Date	School #1		School #2	
Prior to 15 Months of Age	757	(53.2%)	671	(67.9%)
After 15 Months but Prior to 1980	565	(39.7%)	250	(25.3%)
After 15 Months and After 1980	84	(5.9%)	45	(4.6%)
Medical Deferrals	17	(1.2%)	21	(2.1%)
Total	1423	(100.0%)	987	(100.0%)

should be reported immediately to the Local or State Health Department. The health department will initiate contact investigation and implement outbreak control measures. Serologic confirmation of infection should be sought. An acute specimen can be sent for IgM antibody testing to the Maryland Laboratories Administration. Paired acute and convalescent specimens showing a diagnostic rise will also confirm the diagnosis.

References: ACIP. Measles Prevention: Supplementary Statement. MMWR,1989; 38:11-14.

Vibrio vulnificus Advisory:

Have you warned those at risk to avoid sources of exposure?

Patients with underlying liver disease and other chronic medical conditions may be at increased risk of foodborne illness and its complications caused by a variety of organisms in raw or undercooked meat, fish, poultry, shellfish, mollusk or egg products. Recent reports have documented the pathogenicity of Vibrio vulnificus for these persons. It is important that those at risk be made aware of the danger of eating raw mollusks and shellfish, especially oysters, and of exposure to sea water in order to avoid V. vulnificus infections.

The Organism

Vibrio vulnificus is a halophilic (salt-loving) gram negative coccoid marine *Vibrio* that resembles *V. parahaemolyticus*. It can exist in a virulent form encapsulated by an acid polysaccharide capsule or in a less virulent unencapsulated form. Growth of the encapsulated form is enhanced by iron, and the organism can use the iron of hemoglobin, haptoglobin, or transferrin if it is 100% saturated with iron. The organism also produces enzymes which may enhance its invasiveness (1).

Sources

Vibrio vulnificus is ubiquitous in salt water marine environments of the Gulf of Mexico and Atlantic and Pacific coastal waters. Neither its presence nor growth is associated with fecal contamination of water; rather, it is free living and its growth is dependent upon proper temperature and salinity.

Filter feeding mollusks, such as oysters and clams, concentrate *V. vulnificus* in their tissues. The organism has been isolated from mollusks and also from the haemolymph of crabs. The organism may multiply in mollusks and shellfish during shipment and lead to increased risk during warm months.

Risk factors

Although all individuals who consume raw or inadequately cooked mollusks or shellfish may be at risk of acquiring *Vibrio* infections, individuals with liver disease (including cirrhosis and hemochromatosis), or chronic diseases such as diabetes, alcoholism, cancer, renal disease, gastrointestinal disease (including inflammatory bowel disease or achlorhydria), steroid treatment, and immunosuppressive disorders appear to be as highest risk of invasive and fatal *V. vulnificus* disease.

Incubation Period

A median incubation period of 18 hours has been reported for septicemia or gastrointestinal illness associated with consumption of raw oysters.

Clinical features

Three clinical syndromes have been associated with *V. vulnificus:*

1. Primary septicemia: occurs with fever, hypotension or mental status changes (obtundation, disorientation or lethargy). Secondary cutaneous lesions, including ecchymosis, bullae, or cellulitis, generally develop within 24 hours. In a study of 38 patients with *V. vulnificus* septicemia from Florida (2), 95% had liver disease or other underlying chronic disease (see above). Thirty seven (97%) were hospitalized, and 55% died; 92% had eaten raw oysters within seven days before becoming ill.

2. Wound infections: In the same study from Florida, 17 patients were studied who had

V. vulnificus wound infections. Thirteen (76%) received their wounds while having direct contact with sea water including fishing injuries, lacerations with knives, puncture wounds by crabs, boating injuries, laceration while wading, or had contact of a pre-existing wound with seawater. Twelve (71%) were hospitalized and 24% died. Six (35.3%) had underlying liver or chronic disease.

3. Gastrointestinal illness: Seven patients in the above study had gastroenteritis with vomiting, diarrhea, and abdominal pain, and had *V. vulnificus* isolated from their feces. Six were hospitalized but none died; two had underlying chronic diseases. Of note, five also had other enteric pathogens isolated, so the etiology of the gastroenteritis was not necessarily *V. vulnificus.*

Most infections have been reported during the warm months of the year.

Treatment

Tetracycline is the drug of choice for treating experimental *V. vulnificus* infections in mice. Use of tetracycline (or possibly chloramphenicol) and an aminoglycoside has been advocated, although in vitro, an MIC of gentamicin of 8ug/mL was required to inhibit the growth of 90% of *V. vulnificus* isolates tested (3).

Prevention and Intervention

- Physicians should advise patients with liver disease, alcoholism, immunosuppression, renal disease, cancer, or chronic gastrointestinal disease to:
  - Eliminate raw or undercooked mollusks (especially oysters), and shellfish from their diets.
  - Avoid marine injuries, and exercise caution when exposed to seawater or to objects or shellfish that have been exposed to seawater.
- Suspect *V. vulnificus* in a febrile person with liver disease, or underlying chronic medical illness who had recent exposure to marine water or who consumed raw oysters, or other mollusks or shellfish.
- Culture patient specimens for *Vibrio* species.
- Treat as if the infection may be *V. vulnificus*; early treatment may lessen mortality.
- Advise persons at high risk to review their diets and to consider that any raw or undercooked mollusks, shellfish, fish, meat, or egg products may be associated with increased risk of foodborne illness.
- Report cases to the Local Health Department. A questionnaire regarding source of infection should be administered. In cooperation with the Food and Drug Administration (FDA), mollusk and shellfish exposures are traced back to the growing waters.

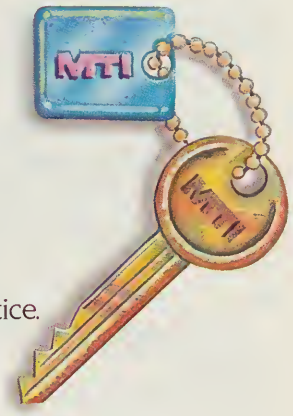
Detection of Rickettsial antigen in Skin Biopsy Specimens of Patients with Rocky Mountain Spotted Fever

J. Stephen Dumler, M.D., of the Department of Pathology, Johns Hopkins Hospital, is conducting a prospective study to evaluate a new immunoperoxidase technique for visualizing *Rickettsia rickettsii* organisms in skin biopsy specimens from patients suspected of having Rocky Mountain spotted fever. Preliminary results indicate that the immunoperoxidase technique may be superior to immunofluorescence in identifying rickettsiae in tissue, and just as rapid. He is seeking skin biopsy specimens from patients in whom the diagnosis of RMSF is suspected.

Specimens sought:

A punch biopsy specimen ($\geq$ 3 mm) of a petechial or rash lesion from a patient suspected of having RMSF is needed.



Preferably tissue should be frozen, or formalin fixed and embedded in paraffin; alternately, pre-cut frozen sections or paraffin sections on glass slides (a minimum of four sections) are acceptable.

Procedures:

When a case of RMSF is suspected and a biopsy has been obtained, call Dr. Jagdish Patel at the Department of Health and Mental Hygiene, 301-225-6152, to obtain details for specimen handling.

Manage your practice in ten-part HARMONY...®

1 **Comprehensive Solutions:** MTI's HARMONY integrates every business office function...data and word processing, claims submission, patient records, appointments scheduling, accounts management...into a comprehensive, turn-key practice management system.

2 **Customized Solutions:** Hardware, software, installation, training, AFTERCARE support, supplies...all custom-tailored to your individual practice.

3 **Unlimited Training:** For your current *and* future staff, for the life of your system.

4 **Over 1000 Doctors:** MTI's systems are meeting the practice management needs of hundreds of physicians...in every specialty, all across the country

5 **Compatibility:** We offer a free evaluation of your system and practice and help you determine lowest-cost options for upgrades...and MTI's systems are compatible with IBM, Wang, DEC, TEXAS INSTRUMENTS and other major manufacturers.

6 **Conversion:** MTI specialists will transfer all practice data on your current system to the HARMONY system. No downtime, no overtime, no anxiety.

7 **Aftercare:** A phone call away, MTI technicians keep your system up and running...with vigilant support, extended service hours, guaranteed response time and repairs, software updates, and custom-programming options.

8 **Money-Back Guarantee:** Something rare among practice management vendors...a money-back guarantee! If HARMONY doesn't meet performance specifications, we'll refund your money.

9 **Non-Obsolescence Guarantee:** Every component offered by MTI is state-of-the-art and will stay that way... supplemented by ongoing system research, programming and enhancements offered to all clients on software maintenance.

10 **Price:** Best of all, HARMONY is competitively-priced *and* cost-effective. Call MTI at 800-777-7MTI.

MTI **Perfecting Practice Management**

9790 Patuxent Woods Drive • Columbia, MD 21046 • 800-777-7MTI • (301) 720-6000

Computer Bytes initiates a new *MMJ* department designed to answer your questions about how to get the most out of your computer. Please address questions to Bruno Mattiello, Director of Computer Services, 1211 Cathedral Street, Baltimore, MD 21201. (Please include your phone number.)

Since this is our first appearance in *MMJ* we begin by giving you a few tips that have been learned the hard way over the years; they might just save you some time and frustration.

Q. What is the AUTOEXEC.BAT file and how does it work?

A. AUTOEXEC is short for automatic execution. This means that a desired set of start-up procedures can be carried out automatically by DOS (disk operating system) referring to the parts of your computer (such as the keyboard, or CON, for console) as devices, each time the computer is turned on. For example, to create an AUTOEXEC.BAT file on drive C that prompts you to enter the date and time and then automatically starts-up your word processing package, type the following:

C copy CON AUTOEXEC.BAT

DATE
(will ask you the date)
TIME
(will ask you the time)
CLS
(will clear the screen)
CD\WORD, for example,
(changes to WordPerfect directory)
WP
(executes wp)
^ Z (which is the function key F6, or hold down the Control Key and press Z)

After you press "Enter" DOS acknowledges that AUTOEXEC.BAT is a copied file by stating "1 File(s) copied."

You are creating a file by telling DOS to copy what you type from the keyboard onto a file in drive C.

Q. How many files can you store on the root directory of a double-sided double-density 360K floppy diskette?

A. You can store up to 64 files in the root directory of a single-sided floppy disk (if you can still find one), and 112 files in the root directory of a two sided 360K floppy. The root directory of the 1.2 megabyte floppy holds 224, and there is space on most hard disk root directories to store 512 files.

If you have ever encountered the "File creation" error while trying to save, it is because the root directory has reached its limit. The best way to avoid this is to create a subdirectory.

The number of directory entries in a subdirectory is limited only by available space on the disk: each subdirectory is a special kind of file that keeps track of other files. Because the subdirectory itself is a file, it can grow in the same way a data file grows when you add information to it. To organize your hard disk properly, don't put any other files on your root directory other than the two hidden system files, AUTOEXEC.BAT, CONFIG.SYS and COMMAND.COM.

Q. What is the CONFIG.SYS file and how does it work?

A. Your system will run without CONFIG.SYS file, but it will work better with one. Many programs demand one. If you are using a database management program that handles more than eight open files at once, you have to prepare DOS for juggling the extra files with a Files = command in CONFIG.SYS. CONFIG.SYS really shines in increasing disk-read buffers, loading device drivers, and adding logical drivers to your system.

Buffers are chunks of memory set aside to store the data your computer most recently read from or wrote to your disk, although some buffers do not store written data.

CONFIG.SYS is also where you instruct your system to load device drivers such as the DOS VDISK.SYS virtual disk (RAM DISK) or drivers to link your basic hardware with mice, external storage devices, or giant hard disks.

In CONFIG.SYS is where you tell DOS how many drivers you are going to want to use. When you boot up, DOS assumes a maximum of five drives (A: through E:). If you use the SUBST command to tell your system to treat a subdirectory like a disk drive to get around PATH or environment limitations, you will have to prearrange it with a LASTDRIVE = CONFIG.SYS command. An example of a CONFIG.SYS file is:

CONFIG.SYS
FILES = 20
BUFFERS = 15
DEVICE = VDISK.SYS 360
DEVICE = ANSI.SYS
DEVICE - MOUSE.SYS

Q. What is the average life of a hard disk?

A. Hard disks have an estimated life of 10,000 hours. Hard disks that use the SCSI (Small Computer Systems Interface) standard, which is faster and more reliable, can operate for 50,000 hours.

The most critical time for a hard disk is during the boot-up process. Avoid any sudden, jerking movements on your desk; you should not slam down objects or kick the desk. Another way to protect your hard disk is to use software that will identify and repair damaged sectors. It is also a good idea to run CHKDSK from your DOS directory from time to time to monitor the status of your hard disk.

Q. I am currently running under DOS 3.0. I would like to upgrade to a later version.

A. Each new release of DOS, starting with 2.0, keeps track of its version number internally. The version number of the operating system you are using can be displayed using the VER command. To transfer a newer version of DOS to your hard disk, execute these commands:

1. Reboot your system using the new version of DOS.
2. ASYS C:
This transfers the new system files to the fixed disk.
3. To replace existing DOSs files on your fixed disk, type the following and press <ENTER>:
REPLACE A:*.* C:\/S/R
4. To add the new DOS files, type the following and press<ENTER>:
REPLACE a:** c:\DOS /a ■

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service.
1211 Cathedral St., Baltimore, MD 21201
Telephone 1-301-539-0872.

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities which might be available in Maryland.

Journal announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

Executive Director's Newsletter

May 1989

New Med Chi President

On April 14, 1989, Raymond M. Atkins MD became Med Chi's President for 1989-1990 at the Faculty's 191st Annual Meeting. Dr. Atkins, who looks forward to an active and successful year as president, stated in the April issue of the *Maryland Medical Journal*, that his primary goal is to strengthen and increase the Faculty's membership.

ICD-9-CM Coding Workshop

Med Chi and the Medical Mutual Liability Insurance Society of Maryland will present an ICD-9-CM coding workshop at several locations in Maryland during May and June. This workshop is designed to educate physicians and their office staff on the proper use of ICD-9-CM coding; e.g., 4th and 5th digit specificity and use of V Codes. As of April 1, 1989, Maryland physicians were required to include ICD-9-CM codes on all Medicare Part B claims.

The dates and locations for the workshop are:

DATE	CITY	LOCATION	TIME
May 9, 1989	Hunt Valley	Medical Mutual Bldg.	4:30-9:30 pm
May 23,1989	Baltimore	Med Chi Bldg.	4:30-9:30 pm
June 6,1989	Salisbury	Sheraton	4:30-9:30 pm
June 19, 1989	Frederick	Holiday Inn	4:30-9:30 pm

The workshop is free; however, enrollment is limited. For more information, see the registration form on the following page or contact Betsy Newman at 539-0872 or 1-800-492-1056 in Maryland.

Mandated Medicare Assignment

On March 16, 1989 the Maryland House Environmental Matters Committee defeated House Bill #395, legislation that would have required all Maryland physicians to accept Medicare Assignment. Dr. Michael R. Dobridge, Med Chi President 1988-1989, testified against the bill on behalf of the Faculty. The Committee defeated the legislation by a 17-6 vote.

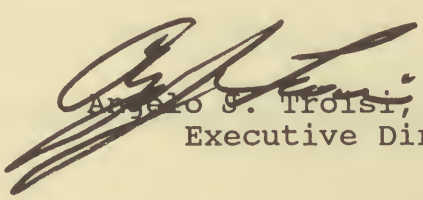
FAX Machine in Annapolis

During each Legislative session, communication between Med Chi, its component societies, physician membership, and the medical community is extremely important. In order to provide timely and accurate information on legislative actions, a FAX machine was installed at Med Chi's Annapolis Office: 301-974-8356. (Med Chi's Faculty Building FAX number is 301-547-0915).

Specialist Identifier

Physicians are reminded that they may not legally represent to the public, including in advertisements and the yellow pages, that they are a specialist in any field of medical practice unless identified as such by the Board of Physician Quality Assurance. Application for specialty designation is open to all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the Board on confirmation of that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the requested specialty. Applications are referred to the Med Chi Committee on Specialist Identification for evaluation and recommendation to the Board. The criteria used for such evaluations were developed jointly by Med Chi and the Board and are set forth in administrative regulations having the force and effect of law. Applications may be obtained from the Board of Physician Quality Assurance by calling 301-225-5900.

Required Employer Health Insurance



The AMA's Board of Trustees has endorsed a proposal that would require employer health insurance coverage. This proposal is an essential component of the AMA's plan to extend coverage to the 35-37 million Americans who lack adequate health insurance. The AMA's Council on Medical Service will present specifications for the proposed plan at the AMA's House of Delegates during its Annual Meeting in June.

Slideshows

At its Annual Meeting in April Med Chi presented *The History of Medicine in Maryland*, an educational slideshow on the origins of Maryland medicine. Med Chi has a variety of slideshows and videotapes available for loan to physicians and medical institutions on topics such as Membership Benefits, Registered Care Technologists, and Music and Medicine. For more information on Med Chi slideshows and videotapes contact Betsy Newman at 539-0872 or 1-800-492-1056 in Maryland.

Real-Time Monitors

Effective March 1, 1989 BC/BS of Maryland will provide benefits for ambulatory ECG monitoring, including Real-Time technology with full disclosure capabilities. Dr. Alevizatos, Chairman of Med Chi's Third Party Liaison Committee has worked extensively with BC/BS to help re-establish this coverage.

Angelo S. Troisi, FACHE
Executive Director

"Essentials of Accurate Coding"

An ICD-9-CM coding workshop presented by the Medical Mutual Liability Insurance Society of Maryland and the Medical and Chirurgical Faculty of Maryland.

As of April 1, 1989, the Medicare Catastrophic Coverage Act of 1988 requires the reporting of diagnostic codes on each request for payment under Part B for services rendered by physicians.

This new requirement will result in an expansion of the existing ICD-9-CM coding requirements.

The objective of these workshops is to provide education to physicians and their office staff in proper ICD-9-CM coding; e.g. 4th and 5th digit specificity and use of V Codes.

DATE	CITY	LOCATION	TIME
May 9, 1989	Hunt Valley	Medical Mutual Bldg.	4:30-9:30 pm
May 23, 1989	Baltimore	Med. Chi. Bldg.	4:30-9:30 pm
June 6, 1989	Salisbury	Sheraton	4:30-9:30 pm
June 19, 1989	Frederick	Holiday Inn	4:30-9:30 pm

General Information

Who should attend: Physicians and Medical Office Personnel
Confirmations: Confirmations will be mailed approximately 10 days prior to the scheduled meeting date.
Attendance Policy: We reserve the right to cancel or postpone meetings due to inclement weather or insufficient enrollment.
Registration Fee: For more information contact: Natalie Harper at (301) 785-0050 Ext. 268.

It will be necessary to **bring your set of ICD-9-CM Code books, Volumes 1 and 2.** Specific addresses and reminders of each session will be mailed approximately 10 days prior to each meeting date. All sessions are free for Maryland Physicians and their employees

USING GUIDES TO THE EVALUATION OF PERMANENT IMPAIRMENT

A Seminar sponsored by the Medical and Chirurigical Faculty of Maryland and the American Medical Association.

Saturday, June 10, 1989
Stouffer Harborplace Hotel, Baltimore, MD

This all day seminar will instruct users of the AMA's *Guides to the Evaluation of Permanent Impairment* -- physicians, attorneys, insurance administrators and others -- how to conduct impairment evaluations and how to understand the new clinical concepts introduced in the *Guides* latest edition. Seminar speakers are major contributors to the *Guides*.

After attending this seminar, you will have:

- An understanding of the validity of the *Guides*
- An understanding of the basic concepts and techniques described in *Guides* and of their everyday applications
- Knowledge of the concepts used in evaluating impairment of the spine
- Knowledge of the concepts used in evaluating impairment of the upper extremity, with case presentations
- Knowledge of the relationship between pain and impairment and of the impact of pain on evaluating impairment

The American Medical Association designates this continuing medical education activity for 7 credit hours in Category 1 of the Physicians Recognition Award of the AMA.

Register NOW, space is limited to 200 persons.

Registration Form: **USING GUIDES TO THE EVALUATION OF PERMANENT IMPAIRMENT**

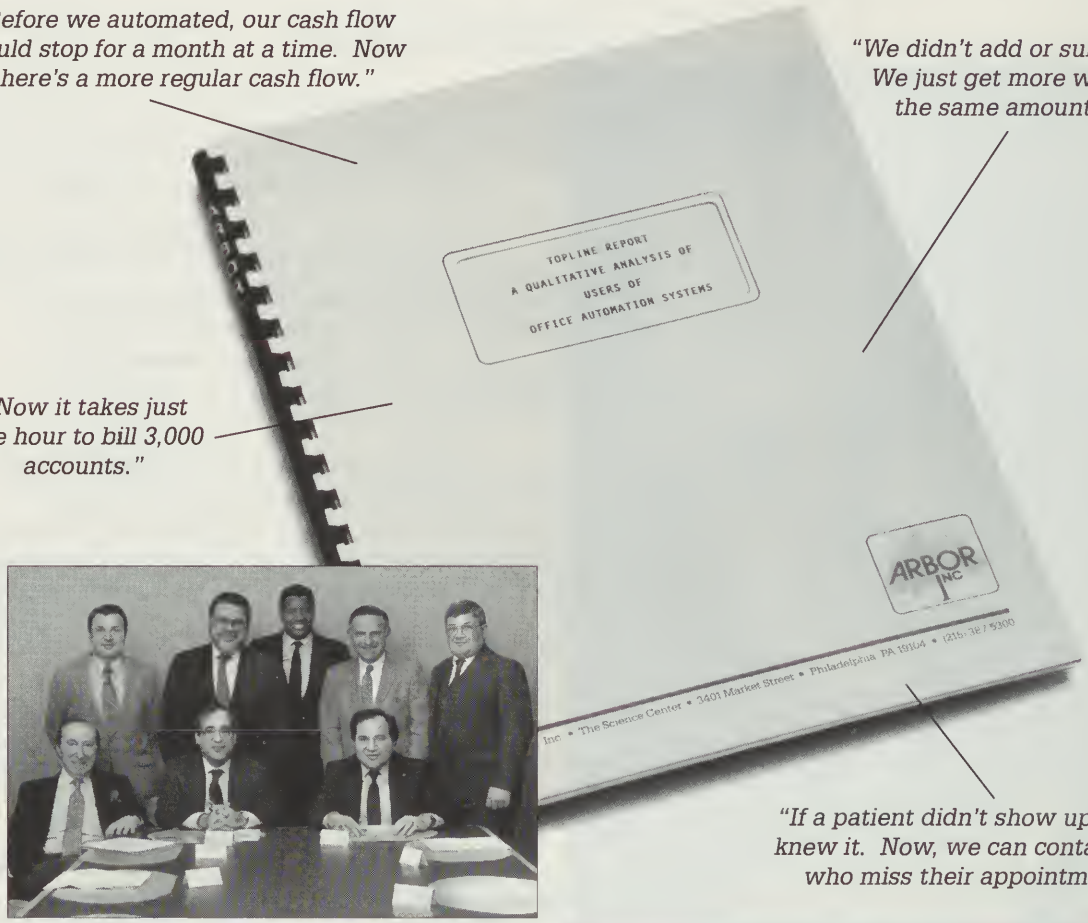
HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

CALL COLLECT
(301) 962-3033



ARMY MEDICINE. BE ALL YOU CAN BE.

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

A Review of Available Smoking Cessation Methods, 1989: Part II

Mark T. Godenick MD, MPH

"It's not hard to stop smoking, I've done it a thousand times," quipped Mark Twain. It is important that physicians realize how difficult it is for a patient to stop smoking and must not be discouraged by a "low success rate" and neglect to recommend to patients that they stop. Even the success of a few patients is worthwhile. Here are some smoking cessation methods that physicians may wish to incorporate into their practices.

Brief Physician Office Counseling

The physician can have a tremendous influence on a patient's health behavior. A two-minute emphasis on abstinence can lead to a 5 percent one-year quit rate.[1] An example of a two-minute approach can be found in the HBP Commentary in the *Maryland Medical Journal*, December 1986. Specific action is recommended in a matter-of-fact manner. Another excellent aid for office use is the American Academy of Family Practice Stop Smoking Kit.[2] Two excellent publications of the National Institutes of Health, "Clinical Opportunities for Smoking Intervention: A Guide for the Busy Physician" and "The Physicians's Guide: How to Help Your Hypertensive Patients Stop Smoking" are also available.[3,4]

Self-help Methods

Self-help methods are readily available, although it is unknown how many people take advantage of them. Few studies have evaluated the self-help books and quit kits that are available. It is known is that if the physician recommends smoking cessation, and follows-up this recommendation, self-help methods are optimized. The table shows a listing of where to obtain these materials. Along with minimal physician effort these simple brochures can give a success rate of between 3 percent and 15 percent. Materials only have to be available for your patients and used regularly.

Mass Media Programs

The best known mass media program advocating smoking cessation in the United States is the American Cancer Society's "Great American Smokeout"(GAS). This is a form of counteradvertising. A study that examined the long-term effects of the GAS estimated that about 1.5 percent of smokers who participated stopped smoking for at least one year.[5] Flay, in his excellent book evaluating 56 mass media programs worldwide notes that in general, the prevalence of continuous nonsmoking at follow-up is highest in the category of television plus print plus community support (11 percent), next highest is the television plus print method (8 percent), and least effective with television alone (about 4 percent).[6] Mass media programs are difficult to evaluate. The smoking cessation rates are self-reported by participants who are self-selected. Other antismoking events take place concurrently, and it is difficult to ascribe reduction in smoking to the mass media event alone. However it appears that quality counteradvertising can provide an audience with effective information concerning smoking cessation.

Acupuncture

Nasopuncture and auriculopuncture are the two main methods of acupuncture for treating patients who smoke. There are few published studies on the efficacy of acupuncture, and most of these are methodologically flawed. Schwartz, in a review of these studies concludes that there is no evidence that acupuncture relieves withdrawal symptoms or promotes smoking cessation: "Acupuncture may act as a placebo procedure to help the smoker handle the addictive component of smoking." If acupuncture is chosen by a patient as the method of choice, the physician may wish to recommend an alternative method.[7]

Hypnosis

Studies on the efficacy of hypnosis in smoking cessation are hard to evaluate because of poor study design or biased follow-up methods. All the study results are based on self-reports, and none are validated by physiological measurements. Spiegal had a response rate of only 45 percent of 616 patients and estimated a success rate of about 20 percent.[8] The most successful study ever reported for hypnosis therapy was conducted by Kline; he used a 12-hour group hypnotherapy session for groups of ten individuals who were previously unsuccessful using other methods. Of the 60 patients treated in this manner, 88 percent were successful quitters after one year.[9] The therapist's skill, experience, and charisma are important aspects of a successful hypnotic therapy session, and hypnosis seems to work well in the hands of a skilled therapist. Before referring patients to a hypnotherapist, the physician should review the methodology and inquire of the success rate.

Stop-Smoking Aids

A number of aids to quitting are available. None of these have published data to evaluate their value. The Food and Drug Administration is studying the effectiveness and safety of these products but has not yet issued guidelines concerning their sale. One example is a reusable filter system, "One Step at A Time," which reduces cigarette smoke tar, nicotine, and carbon monoxide levels gradually over time. A study conducted by Hymowitz, assigned 130 subjects to use graduated filters, placebo filters, or to quit on their own. One year follow-up results showed a 33 percent success rate of those quitting on their own, as compared to quit rates for users of graduated filters, 22 percent, and users of placebo filters, 12 percent.[10] Stop-smoking aids have no documented efficacy or safety, and an individual may be discouraged after unsuccessfully trying to use them. However, some patients who smoke may quit through the use of these aids.

Groups and Clinics

A survey conducted in 1985-1986 by the Office of Smoking and Health reported programs offered by 124 hospitals in 33 states, by 54 health plans or smoking clinics in 28 states, and by 94 health departments in 36 states.[11] Three nonprofit organizations are involved in smoking cessation. The Seventh-day Adventist Church sponsors the "Five-Day Plan to Stop Smoking" now renamed the "Breath-Free Plan to Stop Smoking." Over 14 million smokers in 150 countries have entered this program and its overall success rate is approximately 25 percent. The American Cancer Society has 58 divisions and over 3,000 local units that yearly reach millions of young people and adults with smoking cessation information and programs. The American Lung Association uses the booklet,"Freedom from Smoking Guide for Clinic Leaders," to conduct a self-contained program for smoking cessation. This has been used effectively in the community as well as the worksite. For a more comprehensive look at what these and other organizations are doing obtain the publication, "State and Local Programs on Smoking and Health."[11]

Behavioral Methods

Behavioral methods can be divided into two different categories, (1) aversive methods and (2) self-management techniques. Aversive methods include rapid smoking and may include mild electric shock. Self-management techniques include: nicotine fading, gradually reducing the number of cigarettes smoked over time, stimulus control, rearranging the environment of the smoker to make it more difficult to smoke, relaxation techniques, and contingency management, where a smoker contracts to quit smoking and receives a refund if successful.

An informative review of behavioral smoking cessation methods has been done by Abrams.[12] Hall used relaxation training, a review of the harmful effects and the benefits of stopping smoking, stimulus control, and relapse prevention to achieve a 52 percent one-year success rate.[13] Another successful program by Powell used stress management, negative smoking, relaxation, positive rewards, and self-control; it had a one-year success rate of about 50 percent.[14] Lando and McCullough used satiation, contingency management and group support; they achieved a 71 percent one-year success rate.[15]

Overall, the use of any one behavioral method alone is not very effective. Some of the best success rates have been achieved when a combination of aversive and self-management methods is used. It seems that aversive therapy has good success in the initiation of smoking cessation, but that continued success is better helped by self-management strategies.

Commercial Programs

Many commercial programs have gone out of business over the past decade although SmokeEnders and Schick are still operating. SmokeEnders, which uses various behavioral methods, reported a 40 percent quit rate in 167 respondents out of 553 persons who completed their program.[16] The Schick program includes mild electric shock. Of 832 clients treated in 1985, 327 were randomly selected and followed-up by telephone; a 13-month quit rate of 52 percent was noted.[17] Despite such extreme methods used in patients who smoke and who are motivated to quit (indicated by their willingness to pay for a program), only 40 percent to 50 percent are successful in quitting. This emphasizes how difficult a habit smoking is to break. In

looking at these high success rates one must keep in mind the inherent strong incentive to claim such high rates. Outside evaluations of these programs are rare. Success rates are self-reported based on those who complete the program and are not validated by accepted methods. Ongoing evaluation and monitoring of these programs would be best accomplished by outside evaluation of the programs using the "Standards for the Evaluation of Group Smoking Cessation Programs."[18]

Pharmacologic Aids

There have been over 60 controlled and uncontrolled clinical trials in over 20 countries concerning the efficacy of Nicorette gum in long-term smoking cessation programs and short-term withdrawal symptoms. An extensive review of the controlled studies by Fagerstrom is summarized here:[19] Of the 13 placebo-controlled trials found in the literature, all but one showed Nicorette more efficacious than the placebo gum. This ranged from 3 percent to 49 percent, 6 or 12 month success rates for Nicorette versus 2 percent to 37 percent in placebo-controlled studies. More than half achieved statistical significance, although many were small studies. The most impressive results were achieved in studies that were conducted in smoking cessation clinics using experienced psychologists as therapists. In the seven "no-gum control groups," where identical treatment was given to cases and controls except the use of nicorette gum, all but one found higher 6 or 12 months abstinence rates with the use of Nicorette gum. In the eight studies that compared Nicorette to other treatments (behavioral counseling plus aversive smoking, acupuncture, or skills training) as controls, the gum was about as good or better in all eight studies, with widely ranging results of 12 to 72 percent long-term success rate in the gum studies versus 8 to 76 percent in the other studies.

Clonidine, an alpha-2-agonist, has been shown in a small randomized placebo-controlled trial to ameliorate some of the short-term withdrawal symptoms.[20] The fact that clonidine reduces withdrawal symptoms does not necessarily mean it will be effective in aiding smoking cessation. One recent double-blind, randomized study by Glassman showed that in patients who smoke heavily and who had failed to stop smoking in previous attempts, those treated with oral clonidine had a 27 percent six-month success rate. This was verified by serum cotinine concentration.[21] These studies are small and there is imperative need for larger, longer-term follow-up studies before any formal recommendations for the use of clonidine in smoking cessation can be recommended. One big advantage of clonidine over Nicorette gum is that the person remains free of any nicotine in his or her blood stream.

Conclusion

Smoking is the number one cause of preventable morbidity and mortality in the United States today. The economic costs of smoking to our society are staggering. Smoking cessation is cost effective and worth promoting.

Brief physician office counseling may enable over 5 percent of patients who smoke to quit; combined with other methods this quit rate may be enhanced. Self-help methods are especially effective if recommended by the physician. Mass media programs (such as the Great American Smokeout) are worth promoting. Acupuncture seems to act more as a placebo procedure, and additional methods of smoking cessation should be recommended if this method to quit is chosen. Hypnotherapy may be successful, depending on the hypnotherapist. Group methods and commercial programs may be effective.

Behavioral methods if properly combined and used with motivated patients may help over 50 percent quit for at least one year. Pharmacologic aids if used correctly may also be quite effective.

It is important for every physician to suggest to patients who smoke the health benefits of smoking cessation and to have some therapeutic plan in mind to guide them to this goal. A smoke-free society by the year 2000 is a worthwhile endeavor.

MED PAY *Announces Insurance Processing Breakthrough*

"Physicians Receive Payment Today For Patients Seen Yesterday"

The **MED**ical **PAY**ment Services of Maryland, Inc. program has completely changed the way physicians receive their hard earned fees. **MED PAY** will convert existing receivables into immediate cash and reserves. The doctor then turns over all insurance claims and patient billings for processing by **MED PAY. MED PAY** does all of the rest. In turn, the doctor receives payment today for patients seen yesterday. It really is just that simple.

We know that this may sound too good to be true. So let us prove to you how this unique program can make a dramatic difference to the physician, their practice, and their patients. To set up an appointment for more information, call **828-5050.**

MED PAY is cost effective — especially for smaller practices of 1-5 physicians

MEDical **PAY**ment Services of Maryland, Inc. 1300 York Rd., Suite 150 • Lutherville, Md. 21093

One Minute With Diabetes

How to Choose a Hospital for Diabetic Care

Doctor, my gynecologist recommends that I undergo a hysterectomy because of partial uterine prolapse and cystocele and rectocele. I am 48 years old and have had insulin-dependent diabetes mellitus for 20 years. The gynecologist wants to schedule the surgery, but I am concerned about the status of my diabetes and to which hospital I might go for the best care. What do you recommend?

Often people do not think about choosing a hospital until a crisis arises. You are fortunate to have the opportunity to think about hospital selection and to get properly prepared for your surgery.

Sometimes there is not much choice. Perhaps there is only one hospital in your community or your physician has privileges at only one hospital. The increasing use of health maintenance and preferred provider organizations also may narrow your hospital choices. Sometimes you are forced to go the hospital of your insurer. For special problems, your physician may refer you to another hospital.

Before choosing an insurance plan you should investigate the hospital and physician-care options available to you. Select an insurance program that permits you tho choose the hospital and the physicians. It is necessary to choose a gynecologist and a family practitioner/internist who practice at the hospital of your choice. If the plan does not suit your wishes, it is not the plan for you even though the annual premium might be less than others.

There are three basic types of hospitals:

1. City or county hospitals often provide services for low-income and indigent patients
2. Private or community nonprofit hospitals
3. Hospital teaching centers, usually related to a medical school.

All have advantages and disadvantages, and there is considerable overlapping. Community hospitals are the most common and, except for certain specialized care for which they may not be equipped, are most often used by people living nearby.

When choosing a hospital, consideration must be given to quality of care, friendliness and adequacy of staff, hospital reputation, and its ability to manage your particular problem, a diabetic patient requiring surgery. Your physician and surgeon will be most helpful in making these evaluations; they should know each other and have worked together in the management of other diabetic patients needing surgery.

After your family physician or internist has monitored your diabetic care and any other medical problems for as long as necessary, he or she should send the gynecologist a complete report including list of medications, diet plan, and laboratory reports. When the physicians have agreed on the adequacy of your medical status, they should schedule surgery at a time convenient for all three parties.

Ideally a diabetic patient should be the first surgical patient of the day, usually 7:30 or 8:00 a.m. and early in the week (Monday or Tuesday). The time of the day is important to avoid electrolyte problems, poor glycemic control, and anxiety on the part of the patient. If complications occur a few hours postoperatively, it is probable that a full staff will be available to manage the problem. The beginning of the week is important because neither the operating gynecologist nor the personal physician is apt to be signed out for the weekend to another physician until you are well on the way to recovery. It is true that not every patient can be this selective, but you are the most important patient you know, and you should try to arrange the best possible care for that patient.

Elective preparation for surgery should not be rushed. The patient should be in the best possible health and frame of mind before the procedure. If family or personal problems exist, they should be resolved if possible. You should provide your own blood for replacement should it be needed, and this requires discussion with the gynecologist. One should always have a will that is considered current before being admitted to a hospital for any purpose. Pulmonary embolic phenomena, stroke, and other complications can occur without warning. After such a catastrophe, everyone wishes events had not been taken so lightly.

Note: Management of the diabetic patient the day prior to and on the day of surgery will be outlined at another time.

Treat your practice with the same care you give your patients.

With billing getting more complicated every day, more physicians are depending on computers to streamline the billing process and maintain cashflow. But without strong customer support, computers can aggravate problems instead of solving them.

That's why you need Sentient—a solid local company offering an excellent computer system with effective long-term support. Each Sentient system comes with the training, software and the ongoing support you'll need to adapt to the latest changes in carrier and regulatory requirements. We're always there for you with new enhancements, advice, and to answer questions. For a free consultation call Sentient today.

The Physician - Computer Relationship

H. Gerald Oster MD

Dr. Oster is Chairman of Med Chi's Computers in Medicine Committee.

Perhaps you wonder why an entire issue of *MMJ* is being devoted to computers and medicine; the logic is simple. Technological advances in the art and science of medicine have occurred at an exponential rate, often outstripping the ability of the physician to use them properly. Computers can help fill this gap by assisting the physician in everyday practice as well as by acting as sophisticated research tools.

The computer does not have the cognitive and intellectual capacity of the human mind, but what it lacks in that area, it more than makes up in its abilty to rapidly store, retrieve, categorize, display, and manipulate huge amounts of data. The combination of a physician's mental abilities with the computer's processing power makes a formidable adversary for his enemies: the disease states we are trying to conquer. The computer also is capable of playing the role of man's best friend by assisting in other less dramatic ways such as saving time and making life easier by simplifying daily tasks and increasing the knowledge base.

There is no doubt that computers are and will be playing an increasingly important role in the activities of all health care providers. The leaders of your medical society recognize that fact and hope to assist in making the transition to the computer age less traumatic for physicians. The following articles are intended to yield information that will be useful to clinicians contemplating the use of computers in their professional and personal lives. ■

The Age of Telecommunications

H. Gerald Oster MD

Dr. Oster is in private practice specializing in internal medicine and is Chairman of Med Chi's Computers in Medicine Committee.

Dues for joining the information age consist of owning a personal computer, a modem, and a printer and having access to a standard phone line.

The scenario was all too familiar. Newsmen were gathered around the clanking teletype machine in a smoke-filled room awaiting the latest international developments coming over the AP Wire Service. Do you remember? If so, you have effectively dated yourself. The smoke-filled room has been replaced by the air-conditioned hall filled with the multitude of colorful terminal screens and lightning-fast printers chugging out world developments almost as fast as they occur. This is the world of telecommunications as we now know it; this is the information age!

Would you like to become a part of this expanding universe? You say that you are not technically inclined nor well-heeled enough to afford such luxury? Sorry, those excuses went out with the smoke-filled room. Any of us can expand our horizons far beyond our expectations from the comfort of our living rooms or offices with a minimum of technical expertise and with only a modest monetary outlay. The dues for joining the information age consist of ownership of a personal computer, a modem, and a printer and access to a standard phone line. Almost any brand of hardware will do. You will find the rewards most gratifying, if you happen to be a physician or other health care professional. All right, you say, convince me.

Let's start with the basics. How do these pieces of hardware enable you to link up with the outside world and its vast stores of information?

Your computer is your window to the outside, allowing you to link with many commercial and noncommercial databases. At your terminal you institute the commands that connect you with these services and allow you to query and to communicate with them in an understandable language. The modem is simply a device that translates these commands into a language that may be transferred via telephone lines and deciphered at their destination. Information obtained may then be viewed on your terminal or printed out as hard copy for reading or permanent storage.

All right, you say, I follow so far, but so what? Well, here is where the story becomes interesting. Now that you are computer enabled, how might you want to use this talent?

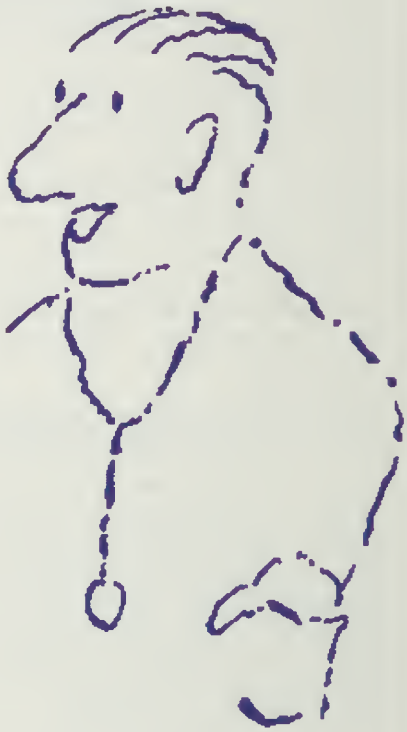
Suppose we start with the particular areas that might interest a health professional. Have you ever wanted to learn more about a particular disease or its treatment? Have you ever desired to perform a literature search of the files of the National Library of Medicine and its vast source of journals and textual material? Have you ever wanted to ask medical experts for an opinion about a stubborn diagnostic problem or late-breaking therapy or research? Have you ever desired to access your hospital's computer system from your office or home and review live laboratory results or other data?

Perhaps you want to communicate with your colleagues about a medical or medicopolitical issue; your colleagues may be five miles away or around the world! Perhaps you want to tune in on a discussion of a particular topic and read the various comments. Maybe you want to read and comment about medical legislative news or read the latest Medicare regulations and their interpretations. All this can be done from your den or office without hiring someone to act as your intermediary.

Many commercial databases and public bulletin board systems that allow these functions are accessible at very reasonable costs or at no cost. All you do is call and log on. The procedures for obtaining information and/or communicating are simple and easy to learn. Everyone understands that health professionals are not necessarily computer experts. Some of the more familiar services include Compuserve Information Service, Dialog, BRS Colleague, MedLine, Paperchase, AMA NET, Maryland Med-Sig (free and sponsored by Med-Chi) and others.

The average commercial database may charge an initial registration fee of approximately $50 (payable only once) and a charge for on-line time of approximately $10-20 an hour during nonpeak hours, (evenings, nights, weekends, and holidays). Public bulletin boards, of course, are yours to view for the price of a phone call. With a little experience it is quite possible to obtain a literature search resulting in 50 abstracts and references in about 15 minutes of on-line time. Programs such as the Grateful Med, available from the National Library of Medicine at nominal cost, will automatically do your literature search after you have entered your queries off-line, that is, before the meter even starts running. Many of these systems contain files (computer programs) that you may obtain and then run on your own PC. This is especially true of the noncommercial bulletin boards (including Med-Sig) that encourage file exchange. These programs may consist of medical educational real-time case studies or programs that perform a specific medical function such as assisting in diagnosis, interpreting data, or selecting drugs for a particular problem. There are also programs that aid in patient education, assist in desktop publishing such as printing a patient newsletter. Nonmedical files are also available. Over 100 public bulletin board systems exist in the Maryland-DC area alone; many have areas set aside for medical topics and files.

There are other fringe benefits of telecommunications, both nonmedical and medical, that might be of interest once you become a telecommunications user. These items are in no particular order and do not address uses for a computer other than telecommunications.



Obtain late-breaking news or stock market quotations
Investigate a company's financial information or stock market history
Research title or author of any book in print
Look up patents
Make airline or hotel reservations from home; find best pricing and scheduling
Send a telegram, Telex, or MCI Mailgram from home
Hook into your office computer system from home
Make inquiries of your hospital computer system and look up live laboratory information on patients (available in several hospitals in this area)
Obtain census and demographic information
Obtain information from other medical type databases, such as hospital administration, nursing, social services, handicapped services, gifted children, medical equipment
Communicate with other computer users for tips and questions about commercial and noncommercial programs, and exchange computer programs (medical, and nonmedical) that are not copyrighted
Perform electronic automatic billing to BC/BS, Medicare, etc. via office computer system
Send electronic mail (public or private) via bulletin boards
Obtain CME credit via computer
File a flight plan with the FAA
Acquire updated weather information and maps
Make purchases at discount with various buying services
Home banking and check writing
Query Dow-Jones News Service and its multiple information areas
Obtain real time stock market and financial news
Buy and sell stocks, bonds, and futures with a discount broker
Check IRS rules and regulations
Obtain government specifications for various items
Read articles from many newspapers across the country, such as the *Harvard Business Review*, *Washington Post*; search these papers for particular information quickly
Buy, sell or trade articles through bulletin boards, local or national
Search for employment or look for an employee
Read reviews on computer programs or computer hardware
Take part in National Computer Echos on almost any topic via local bulletin board access without significant long distance charges
Search for college information for your children
Use for entertainment and games such as playing chess with another user across the country
Participate in medical research conferences
Obtain late-breaking information from the State Health Department
Use special areas on bulletin boards to communicate and exchange files with others in a particular specialty
Communicate with Med Chi
Send and receive FAX data (requires extra hardware)

If none of the above at least piques your interest, telecommunications is not for you. If you do have some curiosity about telecommunications as a tool or a hobby, rest assured that those of us who have had some experience with computers stand ready to assist you in any way possible to overcome whatever fears or trepidations you may have. Most of us also are new at this; we learn and have learned by experimentation and hands-on trial and error. We are not ashamed of the mistakes we made along the way. Why not join us? ■

MEDICAL MALPRACTICE DAZE

For over 20 years, we've specialized in helping Maryland physicians get through the medical malpractice maze. Whether you're shopping for the best combination of price and value or need timely service, you can trust William C. Garrett & Associates. And that's the long and short of it.

"George, have we received our Medical Malpractice renewal information yet?"

"No, our broker's late again this year."

"How can we plan our finances if we don't know our cost in advance? Maybe we need a different broker."

"I've been checking out some of the top brokers in the field."

"We need someone with real expertise...someone we can trust to meet our needs."

"A lot of other doctors at the hospital use William C. Garrett & Associates. They get renewal information about two months in advance."

"Yes, but can he do anything about our high premiums?"

"A number of those other doctors have told me he's even helped them save money."

"Sounds like my kind of broker. Call him and set up an appointment."

"Bob, I already have. He'll be here next Wednesday.

"I'm way ahead of you, Bob. I was given the toll free number of William C. Garrett."

"Who's William C. Garrett?"

"Bill's one of the largest malpractice brokers in Maryland. He's been specializing in medical malpractice for over 20 years."

"That's fine, but what can he do for us?"

"He's already developed full cost and benefit comparisons for all available companies."

"Well, what are we waiting for? Let's get William C. Garrett & Associates started on our customized malpractice coverage!"

"Check your desk, George. It's already there!"

If you'd like information, assistance or simply want to add your name to our newsletter mailing list, just write or call us.

Computers in Medicine Committee

Bruno Mattiello

Mattiello is Director of Computer Services at the Medical and Chirurgical Faculty of Maryland.

One of the group's objectives is to make entering the world of computers as painless and as enjoyable as possible.

The Computers in Medicine Committee was established in 1986 by the Medical and Chirurgical Faculty of Maryland to deal with the impact of the ever-increasing influence of computer technology on the medical professional. The driving force behind this committee was Gerald Oster MD.

The Committee comprises physicians and faculty staff with varying degrees of experience. Some of the members have expertise in telecommunications, hardware configurations, word processing, database management, financial applications, application development, and medically related software.

The members address both the business and professional aspects regarding the impact of computers on physicians and other health care professionals. The Committee hopes to assist in the introduction of any new computer resources to all interested parties and to lend advice and assistance in the fields of telecommunications and medically oriented programs.

One objective of the group is to make entering the world of computers as painless and enjoyable as possible. With the help of Med Chi faculty and staff, the group is organizing training sessions that will enable a physician to acquire expert help in the areas of hardware (what type of computer to buy; what type of software to purchase for a particular task; help in installing the hardware and software in your home or office; and help you become comfortable with the use of this new-fangled contraption called a computer).

The Committee also is concerned with the growing amount of medical management software appearing on the market. More and more physicians are turning to computers to help in their medical practice, and they are looking for ways to run their practices more efficiently.

In the very near future the Committee will be working toward setting up guidelines that can be followed when one enters the computerized office billing market. It will help by giving you a list of questions to ask yourself and to ask the software vendor who will be trying to sell you his medical package.

The Committee is also very interested in the giant leaps in technology that can help a physician in diagnosing patients. Computer programs are being developed in almost every area of

medicine. Programs are designed to help cardiologists perform angioplasty as an alternative to coronary bypass surgery. The software incorporates computer vision and "artificial intelligence" methods designed by engineers at Phillips Medical Systems in the Netherlands, with the help of American medical researchers. The process is known as Digital Cardiac Imaging (DCI).

Because of computer enhancement the images generated offer greater detail than ever before. Because the DCI images are stored digitally they can be recalled whenever needed, permitting the cardiologist, for example, to track the progress of a catheter as it moves through an artery.

The computer revolution is invading the world of psychotherapy. Programs are used with patient - computer interaction that achieve results of seemingly long-term benefit. Programs have been designed to join the theoretical orientations of different types of psychotherapists, such as analysts or behaviorists. Responding to the programs questions, patients basically pick the approach best suited for their particular personality or problem.

Imagine a medical student seated at a console where a large video screen displays a lesion of the arm. It will be up to the student to excise the lesion. Programming of the computer would then relate what the student has inscribed on the arm shown on the video display. This could be accomplished by a marker, a type of instrument somewhat like a "mouse" that is currently used in computer applications. With modifications it could transmit to the user the full sensation of making an incision in real skin. Programming could include depth of cut as well as location and the amount of bleeding expected to take place. Each surgical instrument is displayed on the screen. It will allow the student to sit at the terminal of a surgical simulator and practice an operational procedure until he or she achieves perfection.

Complex procedures could be analyzed to provide the best surgical approach to a specific problem. The simulator could allow for options and choices that might very well be overlooked by a surgical team. The uses for computer simulation are endless, and the technology exists to explore the possibilities.

These are only a few of the new and exciting advancements being made in the forever changing world of computers in medicine.

If you are a physician who has a computer or a physician interested in learning more about the infamous BOX, the Computers in Medicine Committee would be delighted to welcome you as a member. ■

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

CARAFATE® (sucralfate) Tablets

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that simultaneous administration of CARAFATE (sucralfate) with tetracycline, phenytoin, digoxin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The clinical significance of these animal studies is yet to be defined. However, because of the potential of CARAFATE to alter the absorption of some drugs from the gastrointestinal tract, the separate administration of CARAFATE from that of other agents should be considered when alterations in bioavailability are felt to be critical for concomitantly administered drugs.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Chronic oral toxicity studies of 24 months' duration were conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). There was no evidence of drug-related tumorigenicity. A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies were not conducted.

Pregnancy: Teratogenic effects. Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients treated with sucralfate, adverse effects were reported in 121 (4.7%).

Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

OVERDOSAGE

There is no experience in humans with overdosage. Acute oral toxicity studies in animals, however, using doses up to 12 gm/kg body weight, could not find a lethal dose. Risks associated with overdosage should, therefore, be minimal.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm tablets are supplied in bottles of 100 (NDC 0088-1712-47) and in Unit Dose Identification Paks of 100 (NDC 0088-1712-49). Light pink scored oblong tablets are embossed with CARAFATE on one side and 1712 bracketed by C's on the other. Issued 1/87

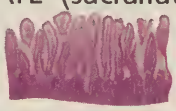
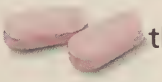
CAFAD276



0160N8



Carafate® for the ulcer-prone NSAID patient

Aspirin and other nonsteroidal anti-inflammatory drugs weaken mucosal defenses, which may lead NSAID users to become prone to duodenal ulcers.[1] For those NSAID users who do develop duodenal ulcers, CARAFATE® (sucralfate/Marion) is ideal first-line therapy. Carafate rebuilds mucosal defenses through a unique, nonsystemic mode of action. Carafate enhances the body's natural healing ability while it protects damaged mucosa from further injury. So the next time you see an arthritis patient with a duodenal ulcer, prescribe nonsystemic Carafate: therapy for the ulcer-prone patient.

Unique, nonsystemic

CARAFATE®
sucralfate/Marion

Please see brief summary of prescribing information, and reference on adjacent page.

0160N8

"Okay Mom, can I drop out now, or do I have to wait 'til I'm old enough to drive?"

Has dropping out become a family tradition?

Census figures show that more than a third of the nation's adults never got past the ninth grade. The current dropout rate for U.S. high school is 28 percent. Is there any correlation? We don't know for sure, but one thing is clear: If parents don't think finishing school is important, students drop out. Despite efforts to keep children in school, our national dropout problem remains one of epidemic proportions.

Insufficient education costs all of us a lot. The unemployment rate for dropouts is twice that of high school graduates. A person with a high school diploma will earn about $200,000 more in his or her lifetime than one who drops out. Today, we are competing with our brains in world markets. And the only way to succeed is with well-educated workers. An effort to correct our dropout problem now can mean a better future for the whole nation.

What can you do? Start close to home. If you have children, keep them in school. Whether you have children or not, help your local school board, teachers, and other parents deal with the problem through community programs. Most of all, try to impress the lifelong importance of a complete education on the young people you know.

When one in four students drops out of school, we must be losing our minds.

Why You Should Computerize Your Practice - and How

Renee Stearns

Stearns is Director of Sales and Marketing, Protologics, Inc.

Computers have become an essential part of every office environment, and the physician's office is no exception.

Efficient management is essential for the complete success of a practice. Yet achieving a high level of efficiency and exercising controls can be very difficult given the time constraints on a physician and his or her staff.

With a manual system even seemingly simple tasks end up being quite complicated and time consuming. Billing, posting payments, and accessing statistics and reports for the practice each take hours and sometimes days to complete. Having few, if any, audit trails to track patient data or cash received allows these items to be lost (or otherwise strayed) far too easily. Tracking overdue patient and insurance accounts, a critical task, is often overlooked for months at a time.

Deficiencies in any of these areas will drain the practice or, at the least, decrease the chances of recovering receivables. Managing the accounts is one of the most important aspects of the practice as a business. Failure to maximize efficiency will quickly add up to thousands of dollars lost every year.

A computer management system can perform virtually all your administrative tasks in a small fraction of the time required by a manual system. In the long run, not only will it save money but also will make money for the practice year after year.

In addition, the time saved on performing these tasks can be better used. Daily, weekly, and annual reports on statistics of the practice can be generated at the push of a button. Trends can be analyzed and forecast, and activities of individual physicians and locations can be tracked. Most important, more time can be given to patients and increased quality care.

Some very good management systems are available at reasonable prices. The problem is in knowing how to choose among the different packages, which range drastically in performance and price. **Do not assume that price reflects quality.**

In choosing an office management system the first thing to remember is that software is the most important part of your system. **The software should determine your hardware, not the other way around.**

To choose the most suitable package you must determine the specific needs of your practice. The number of patients seen

annually, the size of your staff, the number of office locations, and the frequency and format of billing patients are all important factors for deciding what you need in a management system. In short, understand your business operations and what you want to accomplish with your system.

Evaluating Software

When evaluating the actual software package there are many things to consider. The aid you will receive from this software is as important as the software itself. It is wise to know the software company's background, the support they offer, the length of time it is offered, the options for additional support, the fees involved, and if any guarantees or warranties are provided. There are some characteristics in software packages that may reduce your risk and may help assure that you are purchasing a good package backed by proper support.

It is often better to go with a national product, one that has been around for several years and has a very large installation base. A well-established software package is probably a good one if it has survived in many offices for a long time. New packages made by local firms run the risk of company bankruptcy or problems in the system from less-than-thorough testing.

In addition to the security of a national product, it is important to have quick, attentive response should a problem arise. At times, these problems cannot be resolved over the phone and require a personal visit, which can only be provided through local support. Many national companies offer this, but not all.

A **turnkey system** is optimal, one where the same company provides everything from hardware and software to the billing forms and custom programming. With this arrangement, one group is held accountable for your system running smoothly. You do not have to endure the frustration of different service groups blaming each other for problems while your system remains inoperable; this is a common problem.

The software package itself should be **flexible** and **easy to use**. Computers do not have to be difficult. If designed properly, the software will provide on-screen "help" messages and a corresponding user's manual to guide you through the program.

The computer management system also should be flexible enough to adapt to your office flow; you should not have to adjust to it. The software package should allow you to go in and out of different screens to perform more than one task without interrupting the original task.

If you are interested in transmitting insurance claims electronically (which reduces the payment waiting period to five days) be sure that your management package also has an electronic claims package that interfaces with it. If the two packages are not interfaced, double entry for all patient data is required.

Once you have seen the actual software and heard what the company is offering, it is important to check with references. Most will supply you with a list, and some will even arrange for you to visit client's offices. Take advantage of this. Make sure that customers are satisfied not only with the software but also with the support.

Once you have found a suitable software package, the next step is to determine suitable hardware. As previously mentioned, most companies offer hardware with their software. There are many advantages to purchasing the hardware from the same company, and none are to be taken lightly.

Again, most software companies offer national, name brand hardware that they have tested and successfully run with their software. In addition, the majority will offer hardware support for your equipment so that if anything breaks you will receive service, on site, within a few hours.

National, top name systems are known for their IBM compatibility and dependability. Cheaper imitations often claim to be IBM compatible but almost inevitably have problems running different software packages; it is also very difficult to obtain repair service for them when something fails. You may save some money initially in buying a cheaper system, but the money, time, and frustration spent later will be a far greater cost.

Involving Staff

Some final factors to consider when purchasing a computer system are those related to your staff, your current manual system, and the transition to computerization. This will be a major change, but there are remedies to ease the pain.

It is very helpful to involve your staff in the decision-making process for a computer. They will better understand the changes ahead and can be very helpful in evaluating the different packages. After all, they best understand the administrative procedures and can identify when a system will have trouble handling them.

It is also very helpful to do an audit and determine just what skeletons might be hiding. Some of the companies selling management systems provide consulting as a part of their package. They can make suggestions for preparation. **The more organized your manual system is, the more smooth your transition will be.**

The move to computerization is a big one and should be made carefully and thoroughly. The right system will provide you the best possible efficiency in managing your financial interests in addition to enhancing your patient care. Computers have become an essential part of every office environment, and the physician's is no exception. ■

FAX Technology, A Useful Medical Tool

H. Gerald Oster MD

Facsimile technology (the process of transmitting and reproducing graphic materials via telephone lines) has become familiar in the business and professional community in the last several years. Is there a place for FAX in the medical community?

Maam, we just want the FAX [sic]. This famous quotation from the Dragnet era may soon be finding its way into our medical vocabulary. Facsimile technology (the process of transmitting and reproducing printed matter, still pictures, and other graphic materials by use of telephone lines) has become familiar in the business and professional community in the last several years. Architects, engineers, attorneys, financial tycoons, law enforcement agencies, governments, and businesses have been using FAX machines to transmit plans, designs, contracts, documents, and pictures locally as well as worldwide.

New facsimile machines have become standardized so that any two locations can communicate with each other, regardless of the make and model of FAX machines at either end. Phone directories of FAX-equipped locations are finding their way into many offices, and FAX numbers often are seen on business letterheads. Is there a place for facsimile technology in the medical community?

Many uses for FAX by health providers are quite apparent; here are a few likely scenarios in which FAX may be helpful. You, the physician, are busy seeing patients in your office when you receive a phone call from Somewhere General Hospital's Emergency Room. Your patient has just been brought in complaining of atypical chest pain. His electrocardiogram looks slightly abnormal but not diagnostic. The ER physician would like to compare previous EKG readings taken in your office. You might be able to accommodate him by a telephone description, but instead you FAX your EKGs to him for more accurate comparison. He, in turn, sends you the ER tracing, and the two of you are able to consult regarding the disposition of the patient. Lab work and other data also are transferred as well as the results of a recent Cardiac Stress Test. Because of subtle but definite EKG changes (even though clinically the patient seems fine) the patient is admitted and later has definitive EKG changes of significance.

Another patient of yours arrives in the ER at 4 a.m. and is treated and discharged. The ER physician requests that the patient see you first thing in the morning for follow-up. He then FAXes the ER note and lab results to your office. When you see the patient

the next morning, all the vital information is available, allowing you to undertake follow-up care.

Mrs. Jones is seen by a physician in another state who determines that she needs immediate surgery for a pelvic abscess secondary to fistula as a result of Crohn's disease. You have operated upon this individual on three other occasions, and the surgeon would like your operative notes to help guide him.

You are working in your main office when your associate calls from your other office requesting records of a patient that she is seeing there on an emergency visit.

You are sending your medical patient to a surgical consultant to be seen immediately. You would like him to have the benefit of certain medical records and X-ray reports when he sees the patient, and mailing them would take too long.

Your radiology consulting group has just completed a series of diagnostic studies on your patient, who is very anxious to obtain the results. The reports are immediately FAXed to your office, and you phone the patient to relieve her concerns.

Mr. Smith is visiting in Florida for the winter and forgot to take a list of his medications. You FAX the list along with other important medical information to his physician there or possibly to the pharmacy that will be filling his prescriptions.

Several pharmacies in your area fill the majority of your patients' prescriptions. You receive 30 to 40 calls a day from these pharmacies to authorize refills on a routine basis. To reduce the number of calls, the pharmacy FAXes the list of patients and refill requests to you for your authorization, and your office staff FAXes them back with appropriate comments and your signature if required.

Your associate is seeing one of the practice's patients in the hospital and would like to see some records and test results from your office. Your staff FAXes the information to him, and he affixes it to the hospital record.

You are an officer of your medical staff organization, and your signature is needed immediately on an important document. The document is FAXed to you, signed, and returned in a matter of minutes.

You need a MedLine search on new treatments of an unusual illness. You do not have the facilities for performing the search yourself and have requested Med Chi to do so as soon as possible. The search is completed and FAXed to you without delay.

Many of you can think of other uses for facsimile technology, and your colleagues would certainly like to hear them.

What is involved in becoming a facsimile user? Sending and receiving FAX requires only the purchase of a facsimile machine and the availability of a phone line, preferably but not necessarily a dedicated line. There are many FAX machines currently on the market, and prices have decreased over the last several years even though the technical quality of FAX has improved. Most of the popular electronics manufacturing companies are marketing FAX machines through vendors as well as by retail and direct purchase. Many office supply companies will be happy to demonstrate their machines and perhaps even lend out a machine on a trial basis.

Prices range from approximately $800 to $2,200 depending on features needed. A personal FAX machine for an office with limited usage can be found at the low end. A busier office might opt for a more featured machine in the $2,000 range. The main differences in features are the ability to transmit various shades (grey shades) as well as just black and white, automatic unattended dialing (most machines will receive automatically), and the ability to send more detailed graphics.

To receive a FAX transmission, merely set up the machine, and the rest is done automatically at any time of day or night. To send a FAX, insert the document(s) to be sent, dial or autodial the number; the process is automatic. Many machines can be set to transmit in normal or high graphic modes for better clarity at the other end, such as when sending an electrocardiogram with detail. Most machines will verify to you in writing that your transmission was received on the other end and will even keep a log of all FAX transmissions, both sending and receiving.

At the press of a button you may even talk to the receiving station after the FAX is delivered. The actual cost of the transfer is the same as the cost of the phone call plus the low cost of the special paper that the receiving machine prints the document(s) on.

It appears that more and more physicians, hospitals, pharmacies, nursing homes, and medical organizations are joining the FAX club. The more users, the more practical the technology will become. If your appetite has been whetted by this brief description of facsimile technology, consider looking at FAX as a helpful tool in your medical practice. ■

The Last Frontier: Computerizing Appointments

Mary Jo Putney

Putney is a free-lance writer and novelist who lives in Baltimore, Maryland.

Many medical practices have been quick to see the advantages of automating accounts and bookkeeping, but there is much greater psychological resistance to automating appointments although this is among the easiest and most useful functions to computerize.

There are three major reasons why patients telephone doctors' offices: to make or change appointments, for billing inquiries, and to ask medical questions. The first two are easily computerized, with consequent improvements in efficiency and cost savings.

"You wouldn't believe the amount of time we used to spend looking for patients' charts," says Theresa Landon with a laugh. Mrs. Landon is medical assistance supervisor of the Anne Arundel Orthopaedic Surgeons practice in Annapolis, Maryland, and one of her major duties is scheduling surgeries for all five physicians in the office. "Phones are ringing here all the time, and usually it is to make an appointment or to find the time of one when a patient has forgotten. Since it wasn't practical to check through the whole appointment book, that meant going to the individual chart, which could be anywhere. Not just in the file cabinets, but in the lab, in the doctors' offices. Even piled on a desk when things were hectic!"

All that changed when the practice acquired a computer system. The office manager, Mrs. Gerry Clark, says, "The decision to automate the office was for administrative reasons, such as bookkeeping and records. We bought the appointments module with the rest of the computer system, but we had no idea how rewarding it would prove to be."

While many medical practices have been quick to see the advantages of automating accounts and bookkeeping, there is much greater psychological resistance to automating appointments, even though this is one of the easiest and most useful functions to computerize. Appointments are the lifeblood of a medical practice, and a physical appointment book that can be held in the hands is very reassuring. Yet that same book is subject to spilled coffee, multiple erasures, and the inconvenient fact that only one person has access to it at any one time.

While all medical practices can benefit by a computerized appointment system, clearly larger practices benefit most. Well-designed software can schedule physicians and other medical personnel as well as equipment and examining rooms. For ex-

ample, practices in specialties such as ophthalmology, neurology, and internal medicine often own single pieces of expensive equipment, and an appointment system can insure that only one physician at a time will be examining a patient who might need that equipment.

Being able to book appointments at any convenient computer terminal is an obvious plus, particularly at practices with multiple office sites, but there are less obvious side benefits. Nationwide, the no-show rate for physicians' offices is on the order of 30 percent, and the limitations of a paper appointment system can be a contributing cause.

A common patient complaint is that doctors' offices are run for the convenience of the doctors, with little sensitivity to their patients, and it is true that the high-pressure atmosphere of a busy office is not conducive to long searches of an appointment book to find the best time for the patient. A patient who reluctantly accepts an opening that is inconvenient for him, such as four o'clock Friday afternoon, is far more likely to skip the appointment than a patient who has a time better suited to his personal schedule. Computerized appointments allow the practice to accommodate the patient by efficiently finding openings by day, date, and time range. Not only will an office's no-show rate improve, but also patients are more satisfied with a practice responsive to their needs and plans.

Another feature that good appointment packages offer is bulk scheduling, which is particularly useful for specialties such as psychological counseling, obstetrics, and physical therapy. A group of times, such as Tuesday and Thursday at ten o'clock for the next three months, can be booked all at once. Some systems can be programmed to send reminders of appointments that were set months in advance or to remind patients not to eat for twelve hours before an examination or other special requirements.

Anne Arundel Orthopaedic Surgeons is one practice that has been very pleased with their computerized appointment system. The original decision to computerize was made in 1985, when the practice had four surgeons. The doctors and senior office staff made a wish list of everything they would like to have in the new system, and vendors were invited to make presentations. After evaluation, the staff selected the Harmony integrated software system from Medical Technologies, Inc.

Besides liking MTI's overall proposal, office manager Gerry Clark says that she and the doctors appreciated the vendor's willingness to make modifications to suit the special requirements of a surgical practice. In addition, MTI offered extensive training, both on-site and at the supplier's facility.

"MTI's training was excellent, and we took full advantage of it," said Mrs. Clark. "Everyone in the office went to MTI as often as necessary, and when we actually went on-line, an MTI trainer was here on site for two days, which made the transition very easy."

As in many offices, there was some initial resistance to computerization; Mrs. Clark said that her long-time bookkeeper was so apprehensive that she considered resigning. "The same employee now loves the system and recently said that she can't imagine the office without it."

Not all employees resisted in the beginning. "The younger girls used the system as a toy," Mrs. Clark recalled. "I even found that we had Mickey Mouse and Donald Duck entered as patients."

Teri Landon was a staff member who welcomed the new system. "I was excited about the decision to automate because I've always wanted to work on a computer system. The surprise was how much easier it was to learn than I had expected. The Harmony system is well designed, and the MTI trainers did a good job."

The bookkeeping and records software was easily implemented, and after six months the appointments module was integrated into the system. The MTI system allows up to ninety-nine separate appointment books to be maintained, though currently the practice requires only sixteen. A split-screen feature makes it possible for the office staff to compare and use two books at once. The books were customized to the physicians' individual tastes, such as a preference for early morning appointments, or out-of-office time. Scheduled surgeries, meetings, and vacations are routinely maintained in these books.

"Under the manual system," Mrs. Clark said, "staff members were constantly competing for the appointment book: the doctors to review their schedules, the X-ray technicians and the surgical-posting secretary for their specific needs. The staff was unable to schedule surgeries while patients were there in the office because the book was always tied up. Now any staff person, via a terminal, can gain access to all records and appointments at all times."

Determining a future appointment time for a patient who has forgotten is now as easy as entering the patient's name; another keystroke will provide that same patient's future appointments. A further big plus is that any staffer can immediately

Harmony Practice Management System

The Harmony integrated management system is produced by Medical Technologies, Inc., and requires 512K RAM in an MS-DOS system and one megabyte under Xenix®. Software packages are available from $6,000.

Harmony is designed to be flexible and expandable. The core software includes all billing insurance processing and coding, receivables management, automatic write offs, and overall patient care management. Integrated Productivity Modules and Specialists' Practice Modules may be added at any time, and the vendor also will create custom software for specialized practice needs.

The Appointments Module is fully integrated with the core software and can be operated from any terminal in the system. Up to 99 appointment books can be maintained, and a split screen feature makes it possible to compare multiple books at once.

For more information contact: Medical Technologies, Inc., 9790 Patuxent Woods Drive, Columbia, MD 21046 (800-777-7MTI).

respond to questions from patients, lawyers, or insurance companies. This feature is particularly helpful when the front desk is busy.

In the future, the office plans to send reminder letters for long-range appointments. "Most of our patients make follow-up visits within just a few weeks, but conditions like scoliosis require six-month or yearly check-ups," said Mrs. Clark. "Reminders will be useful in those cases."

At the time of the initial computer purchase, the practice had four orthopaedic surgeons and only one location. There are now five surgeons (Drs. Robert S. Ellis, Allen C. Egloff, Neill S. Cooper, Garrett J. Lynch, and Jeffrey R. Chain), a physician's assistant, and two satellite offices in addition to the original site. "The computer system made it possible to establish the satellite offices," Mrs. Clark explained. "I know of other practices that use call-forwarding to set up appointments at the central office. That can be very frustrating because everyone has to wait if the phones are busy or the staff is occupied. With the Harmony system, the computer makes all appointment books instantly available to everyone at the office."

Every morning charts are pulled for the next day's office appointments, and surgery charts also are pulled. On the actual day, the charts are checked again for any schedule changes. The physical charts are maintained in the central Annapolis office, but many records are kept in the computer so even a walk-in patient can be taken care of promptly. In addition, the practice has ordered a FAX system to connect the three sites.

Each doctor receives a print-out of his schedule each morning, including notes identifying the patient as new or follow-up; whether the appointment is likely to be long or short; whether procedures like suture removal or debridement will be required. Appointment print-outs can be done at any time, and routinely include patients' phone numbers, a particularly convenient feature when it is necessary to reschedule appointments.

The print-outs are also a useful back-up. "It's reassuring to have physical lists of each day's activities," Mrs. Clark said. "Fortunately the system is rarely down, but when it is, new appointments can't be made and old ones can't be checked. With the print-outs, most of the normal business of the office continues without interruptions."

Teri Landon mentions another particularly valuable aspect of the system. "Now we can keep up with the work much more efficiently, and that reduces the stress level in the office. Both staff and patients are happier."

Since scheduling is primarily a front-desk task, the software that manages appointments should be significant, if not the most important factor, when medical practices are evaluating the computer system that will best suit their needs. If appointments and billing are being processed with maximum efficiency, the office has more time available for its principal function: the profession of healing.

"In the past, medical practices bought computers to increase efficiency," Gerry Clark concludes, "but we're using the computer for more varied purposes than we ever expected. We have recognized that the computer is simply a better system." ■

Our New Brain Injury Unit Gives People The Chance To Live Their Lives Again.

Each year some 700,000 Americans experience traumatic brain injury. Most survive. But they deserve more. They deserve the chance to live productive lives again, a chance made possible by the Sinai Rehabilitation Center's new in-patient Traumatic Brain Injury Unit.

Our special unit helps brain-injured patients to regain motor skills, speech, daily living functions and independence. And with our out-patient day programs and vocational services, we now provide the total care and commitment necessary to help brain injury patients return to home, community and even the workplace. Survival is just a start. At the comprehensive Sinai Rehabilitation Center, we're giving people the chance to live their lives again.

The Sinai Rehabilitation Center

Belvedere at Greenspring, Baltimore, Maryland 21215, (301) 578-5624.

What Else Can Computers Do?

Harold L. Krell

Krell is Vice-President of LifeCard, International, Inc.

Computers in a medical practice are no longer restricted to front-desk or back-office operations; they can provide a gateway to a wealth of information or place incredibly helpful tools at one's disposal.

If you've been out of medical school for more than ten years, chances are you are not practicing medicine today the way you did during your internship and residency. Technology has changed dramatically in the areas of pharmacology, diagnostic equipment, surgical procedures, and so on. So too technology has changed for the application of computers in a medical practice.

The advent of powerful microcomputers has created all types of opportunities for today's medical practice to take advantage of this technology. Computers in a medical practices are no longer restricted to front-desk or back-office operations like billing, word processing, and appointment scheduling. While many medical practices have invested in personal computers, most are used by secretarial or clerical personnel.

In reality, today's clinician can look to an inexpensive personal computer to provide a gateway to a wealth of information or to place incredibly helpful tools at his/her disposal. To those of us with an interest in computers relating to the medical profession, it has become painfully obvious that these wonderful applications are underutilized simply because most clinicians have little or no hands-on experience with computers and are unaware of the applications they have beyond the business side of the practice.

In the limited space available here, let's examine a few of the more general applications that would be appropriate for a wide range of practices and medical specialties.

Drug/Drug Interactions

We have heard the large retail pharmacy chains advertising computerized applications that maintain a patient drug profile that can intercept potential adverse effects caused by multiple medications. But what about the local pharmacy that does not have that capability or the prescription that gets filled at a pharmacy other than the patient's normal one? For your office use, there are programs available that will compare the effects of over 50,000 prescription and OTC products. In addition to simple drug/drug interactions and patient profile storing, these systems offer some or all of the following features:

Admixture Incompatibility
A comprehensive admixture incompatibility database with reference to Dr. James King's "Guide to Parenteral Admixtures."

Clinical Laboratory Interference
A clinical laboratory interference database indicating potential false outcomes resulting from the chemical composition of single or multiple products.

Drug/Nutrient Interactions
Providing information on the effect of specific drug entities upon naturally occurring nutrients such as vitamins and minerals.

Patient Advisory Information
The ability to print patient instructions regarding compliance or to print all OTC products containing a specific ingredient or to print nonprescription drugs by trade name that interact with specific prescription drugs.

Most of these systems are available with monthly or quarterly updates to the database, and at least one is endorsed by the American Pharmaceutical Association (APhA). They run on IBM PC/ATs or compatible machines and cost approximately $400 to purchase the initial software with updates ranging from $200 to $400 per year.

Commercial and Medical Databases

Several database subscription services are available that allow you to tie into medical and commercial databases via a telephone line hook-up from your personal computer to their large mainframe computers. If your computer is not equipped with a modem (the device needed to convert telephone signals into those your computer can identify) you can add one for less than $200. These subscription services require minimal initial investments (0-$100) and some have $25-$50 monthly minimum usage charges. Your total cost for these services is based on the number of minutes you are connected to the databases. While there are over 700 databases available, these are some of the more popular topics covered:

Medical/Clinical
- AP News offers an online medical newswire service.
- Medline offers an index of over 3,000 medical journals published in over 70 countries with articles dating back to 1966. About 40 percent of the articles contain abstracts.
- U.S. Medical Research Update reports on R&D biomedical research organizations with particular emphasis on treatments for cancer and heart disease.

Commercial
- Dow-Jones provides up-to-date stock quotations. The data received can be electronically integrated into several portfolio manager software products.
- OAG is an online version of the Official Airline Guide.
- Magills Survey of Cinema summarizes and provides critical analysis of over 1,800 noteworthy films dating back to 1902. Records also include cast, credits, and awards.
- Academic American Encyclopedia contains the full text of the encyclopedia published by Grolier.

Continuing Medical Education

CME credits are available through a variety of computerized sources. Courses are available through subscription services or on diskette from companies such as Scientific American and Williams & Wilkins. The programs on diskette can be used for credit and for training staff members. On a local note, Med Chi's own Center for Health Education is exploring the idea of offering online and/or diskette CME courses for distribution among Maryland physicians and surgeons.

Desktop Publishing

Desktop publishing is one of the personal computer industry's newest "buzz words." Simply stated, it allows you to produce a professional-looking newsletter complete with headlines, different type faces, and graphics. Many of today's practices have begun to invest in vehicles to communicate with their patient population. Desktop publishing is an inexpensive mechanism to deliver your custom message.

Remote Communications

The inexpensive programs (under $100) such as Carbon Copy and PC Anywhere allow you to communicate with your machine in the office from your computer at home or vice versa. With this software you take over the controls of the computer in the remote location and operate it as if you were there.

Graphics

Graphics packages such as Harvard Graphics, PC Paint, and Storyboard allow you to create professional graphs and pictures that are perfect for use in creating overhead transparencies or 35mm slides.

Finance

There is an endless variety of products available for personal money management, portfolio management,

and tax planning. Some of the best known products in this area are Managing Your Money, Managing the Market, and Telescan. They range in price from under $50 to several hundred dollars.

Recreation

All work and no play.... An esteemed member of the Computers in Medicine Committee shared his innermost computer secrets by permitting me to peruse the litany of recreational software contained in his computer. I was able to test drive a Lamborghini Countach and challenge the world's greatest golf courses with Mean 18 Golf. I flew from BWI to Atlantic City with Flight Simulator where I won thousands of dollars at an imaginary casino playing Blackjack and Craps. I challenged world champions in Grand Slam Bridge, Gin Rummy, Pool, and Sargon Chess. And to top it all off, I checked my biorhythms for the next month to determine when it would be best for me to return to these games of chance.

As you can see from this brief review, the world of microcomputers can provide dramatic changes in the operation of a medical practice. When you think about it, microcomputers have had an effect on almost all phases of today's lifestyle. Automobiles are controlled by microprocessors as are coffee makers, VCRs, stereos, children's games, heating systems, telephones; the list goes on and on. Why not take advantage of this technology we take for granted in our everyday life and apply it to the controlled environment of our businesses?

An excellent source for learning more about medical computer software is *MD Computing* magazine's annual "Buyers Guide" that presents abstracts of several thousand computer software products designed for use in a medical practice. This publication details all the software available for specific medical specialties and is complete with author contact and pricing information. *MD Computing* is published by Springer-Verlag New York, Inc.

To further assist you in learning more about the use of computers in your practice and at home, our company has embarked on a cooperative venture with the Computers in Medicine Committee of Med Chi to sponsor a series of lectures conducted by members of the Med Chi faculty. These lectures will be held at several area hospitals and are open to all clinicians wishing to learn more about computer applications.

The first lecture will be held at Homewood Hospital Center South on May 17, 1989. Our guest lecturer will be Dr. Gerald Oster. If you would like to attend this session or would like information regarding future dates, please contact Joan Pepersack at 301-494-4800.

Our company was pleased to join Med Chi's Center for Health Education, the Computers in Medicine Committee, and the University of Maryland Department of Family Practice is conducting a survey of hundreds of Maryland clinicians regarding their use of computers in their practices and at home. Some respondents have told us they are computer illiterate while others are computer enthusiasts. We believe the results of this survey will represent a cross-section of today's practicing clinician. We are compiling the results of the survey (using a computer, of course) and hope to publish its results in a near future issue of *MMJ*. ■

Doctor Planning to Relocate?

If you are moving or planning to, let us know so that you won't miss a single issue of *Maryland Medical Journal*.

Elegant Entertaining

Begin or End a truly special evening in the elegant atmosphere of the historic Kraus Memorial Reading Room, 1 block from the BSO. Available for catered functions everyday. Please call Pat Marshall at 301-539-0872 for information.

Authors of Articles
Along with manuscripts submitted to ***MMJ***, please send an IBM compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.
At your request, ***MMJ*** will return your disk after your article is published or if your manuscript is not accepted.

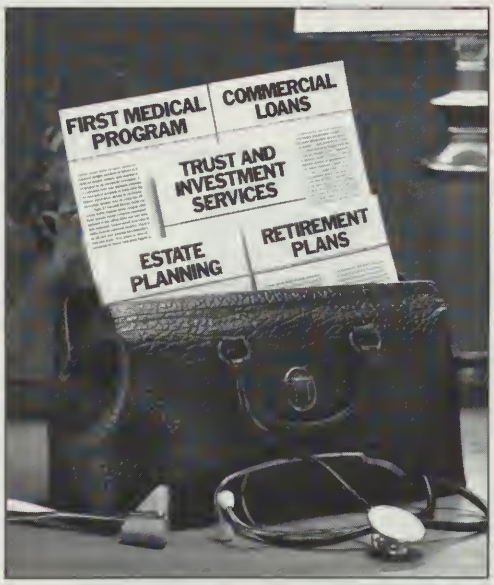
"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.



Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Healthcare
MERIDIAN

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

ENDING TAILS OF OWE

"My group was faced with a Claims Made tail payment which was about to jump to over $70,000. The Harjes Agency worked with Princeton Insurance Company to get us out of Claims Made and into *Occurrence Plus*. We saved over $30,000 and have no future tail to worry about."

Dr. Robert A. Murphy, Anesthesiologist
Mount Holly, New Jersey

Introducing *Occurrence Plus*

Medical Malpractice Insurance to Maryland Physicians

Princeton Insurance Company now offers a better choice of malpractice liability coverage, *Occurrence Plus*. Combining the best features of standard occurrence and claims made policies, *Occurrence Plus* eliminates the need for a costly tail. In fact, no other company offers malpractice insurance with all the benefits of *Occurrence Plus*.

LEARN HOW YOU CAN ESCAPE THE COSTLY CLAIMS MADE TRAP.

Discover the advantages of *Occurrence Plus* by calling Denise Dortch at 301-785-6161. The Harjes Agency, through years of experience with Princeton Insurance Company, can show you how to convert to *Occurrence Plus* smoothly, without a lapse of coverage.

Our Anniversary Year

Visibility of our State Auxiliary and recognition for our work has dominated the 1988-1989 Fortieth Anniversary Year.

In November the Auxiliary, Med-Chi, Maryland Medical Political Action Committee, and specialty societies jointly participated in "Docs for Don." This was a breakfast meeting with Governor William Schaefer, who is a friend of medicine. I introduced myself and stated that I was State Auxiliary President representing physician spouses in Maryland. When the Auxilians present had our picture taken with the Governor, he looked at me and said: "Auxiliary." Bingo for us!

January 31 was Auxiliary Day in Annapolis. Vicki Cameron, State President-Elect; Josie Figueroa, Nominated State President-Elect; Dan Divito, Legislation Chairman; Mary Skipton, Past State President and Legislative Chair; and I stood on the dais in the Maryland Senate chambers and proudly received from Mike Miller, President of the Senate, a Resolution to our Auxiliary "In Recognition of Contributions in Health, Education and the Promotion of Quality Health Care."

We are thrilled that our worthy organization has received the recognition and visibility that it truly deserves. Our commitments and accomplishments in our own counties are varied, and they have had a tremendous impact on our communities. We should be proud of our work!

Thursday, April 13 was a joyous celebration of our 40th Anniversary. A further celebration will occur in Chicago, June 18-21, at the AMA Auxiliary Convention when Mary Strauss (Mrs. Albert J., Jr.) will preside. We have been proud and honored that Mary has been the first AMA Auxiliary President from Maryland. Maryland Auxilians will be delegates and official floor pages during all meetings. Once again we will be in our uniforms of black skirts and yellow jackets to represent our state flower, the Black-Eyed Susan. A Maryland delegation dinner will join the Medical Society and Auxiliary in fellowship.

The State Auxiliary is proud of its 40 years of rich and varied history, and we have been proud that Mary Strauss, as AMA Auxiliary President, could serve as a further honor for the State Auxiliary.

EVA EDMONDS, Past President

Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland. Mrs. Victoria Cameron President; Mrs. Betty J. Molz Editor. ■

EVERY DOCTOR IN MARYLAND IS IN DANGER OF BEING POISONED.

Malpractice insurers threatened by the prospect of lost business are spreading poisonous untruths. For an antidote, call any of the 10,500 physicians already protected by PIE Mutual.

Ever since PIE Mutual began offering Maryland doctors a better concept for their professional liability insurance, some of our competitors haven't been telling you the truth.

Now, they're getting desperate because we're kicking them right square in their bottomlines.

Have you seen the latest so-called "study" which they claim examines our financial health? The competition paid for it, and now they are circulating it anonymously to Maryland doctors, regulators and the media.

They're telling you we're DOA. We advise that you get a second opinion.

This bunch recently tried the same thing in Missouri. We stopped them dead in their tracks there, and we'll do the same in Maryland.

The plain truth is that their "study" contradicts the latest official findings of regulators in Ohio, Kentucky and now Missouri. These findings are endorsed by three internationally respected accounting and actuarial firms.

But you don't have to take our word for it. Call us at 1-800-228-2335. We can put you in touch with any one of more than 10,500 doctors who know the truth about PIE.

NEW

CARDIZEM® SR

(diltiazem HCl) sustained release capsules

For hypertension

EFFECTIVE MONOTHERAPY WITH HIGH PATIENT ACCEPTANCE

Starting Dosage:

90 mg bid*

Also Available: 120-mg capsules

*Dosage must be adjusted to each patient's needs, starting with 60 to 120 mg twice daily.

BRIEF SUMMARY
CARDIZEM® SR
(diltiazem hydrochloride)
Sustained Release Capsules
CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, (3) patients with hypotension (less than 90 mm Hg systolic), (4) patients who have demonstrated hypersensitivity to the drug, and (5) patients with acute myocardial infarction and pulmonary congestion documented by x-ray on admission.

WARNINGS

1. **Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (nine of 2,111 patients or 0.43%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
2. **Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). An acute study of oral diltiazem in patients with impaired ventricular function (ejection fraction 24% ± 6%) showed improvement in indices of ventricular function without significant decrease in contractile function (dp/dt). Experience with the use of CARDIZEM (diltiazem hydrochloride) in combination with beta-blockers in patients with impaired ventricular function is limited. Caution should be exercised when using this combination.
3. **Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
4. **Acute Hepatic Injury.** Mild elevations of transaminases with and without concomitant elevation in alkaline phosphatase and bilirubin have been observed in clinical studies. Such elevations were usually transient and frequently resolved even with continued diltiazem treatment. In rare instances, significant elevations in enzymes such as alkaline phosphatase, LDH, SGOT, SGPT, and other phenomena consistent with acute hepatic injury have been noted. These reactions tended to occur early after therapy initiation (1 to 8 weeks) and have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in some cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies, oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Dermatological events (see ADVERSE REACTIONS section) may be transient and may disappear despite continued use of CARDIZEM. However, skin eruptions progressing to erythema multiforme and/or exfoliative dermatitis have also been infrequently reported. Should a dermatologic reaction persist, the drug should be discontinued.

Drug Interaction. Due to the potential for additive effects, caution and careful titration are warranted in patients receiving CARDIZEM concomitantly with any agents known to affect cardiac contractility and/or conduction. (See WARNINGS.) Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

As with all drugs, care should be exercised when treating patients with multiple medications. CARDIZEM undergoes biotransformation by cytochrome P-450 mixed function oxidase. Coadministration of CARDIZEM with other agents which follow the same route of biotransformation may result in the competitive inhibition of metabolism. Dosages of similarly metabolized drugs, particularly those of low therapeutic ratio or in patients with renal and/or hepatic impairment, may require adjustment when starting or stopping concomitantly administered CARDIZEM to maintain optimum therapeutic blood levels.

Beta-blockers: Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated, but available data are not sufficient to predict the effects of concomitant treatment in patients with left ventricular dysfunction or cardiac conduction abnormalities.

Administration of CARDIZEM (diltiazem hydrochloride) concomitantly with propranolol in five normal volunteers resulted in increased propranolol levels in all subjects and bioavailability of propranolol was increased approximately 50%. If combination therapy is initiated or withdrawn in conjunction with propranolol, an adjustment in the propranolol dose may be warranted. (See WARNINGS.)

Cimetidine: A study in six healthy volunteers has shown a significant increase in peak diltiazem plasma levels (58%) and area-under-the-curve (53%) after a 1-week course of cimetidine at 1,200 mg per day and diltiazem 60 mg per day. Ranitidine produced smaller, nonsignificant increases. The effect may be mediated by cimetidine's known inhibition of hepatic cytochrome P-450, the enzyme system probably responsible for the first-pass metabolism of diltiazem. Patients currently receiving diltiazem therapy should be carefully monitored for a change in pharmacological effect when initiating and discontinuing therapy with cimetidine. An adjustment in the diltiazem dose may be warranted.

Digitalis: Administration of CARDIZEM with digoxin in 24 healthy male subjects increased plasma digoxin concentrations approximately 20%. Another investigator found no increase in digoxin levels in 12 patients with coronary artery disease. Since there have been conflicting results regarding the effect of digoxin levels, it is recommended that digoxin levels be monitored when initiating, adjusting, and discontinuing CARDIZEM therapy to avoid possible over- or under-digitalization. (See WARNINGS.)

Anesthetics: The depression of cardiac contractility, conductivity, and automaticity as well as the vascular dilation associated with anesthetics may be potentiated by calcium channel blockers. When used concomitantly, anesthetics and calcium blockers should be titrated carefully.

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in in vitro bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded from these studies.

The adverse events described below represent events observed in clinical studies of hypertensive patients receiving either CARDIZEM Tablets or CARDIZEM SR Capsules as well as experiences observed in studies of angina and during marketing. The most common events in hypertension studies are shown in a table with rates in placebo patients shown for comparison. Less common events are listed by body system; these include any adverse reactions seen in angina studies that were not observed in hypertension studies. In all hypertensive patients studied (over 900), the most common adverse events were edema (9%), headache (8%), dizziness (6%), asthenia (5%), sinus bradycardia (3%), flushing (3%), and 1° AV block (3%). Only edema and perhaps bradycardia and dizziness were dose related. The most common events observed in clinical studies (over 2,100 patients) of angina patients and hypertensive patients receiving CARDIZEM Tablets or CARDIZEM SR Capsules were (ie, greater than 1%) edema (5.4%), headache (4.5%), dizziness (3.4%), asthenia (2.8%), first-degree AV block (1.8%), flushing (1.7%), nausea (1.6%), bradycardia (1.5%), and rash (1.5%).

DOUBLE BLIND PLACEBO CONTROLLED HYPERTENSION TRIALS

Adverse	Diltiazem N=315 # pts (%)	Placebo N=211 # pts (%)
headache	38 (12%)	17 (8%)
AV block first degree	24 (7.6%)	4 (1.9%)
dizziness	22 (7%)	6 (2.8%)
edema	19 (6%)	2 (0.9%)
bradycardia	19 (6%)	3 (1.4%)
ECG abnormality	13 (4.1%)	3 (1.4%)
asthenia	10 (3.2%)	1 (0.5%)
constipation	5 (1.6%)	2 (0.9%)
dyspepsia	4 (1.3%)	1 (0.5%)
nausea	4 (1.3%)	2 (0.9%)
palpitations	4 (1.3%)	2 (0.9%)
polyuria	4 (1.3%)	2 (0.9%)
somnolence	4 (1.3%)	—
alk phos increase	3 (1%)	1 (0.5%)
hypotension	3 (1%)	1 (0.5%)
insomnia	3 (1%)	1 (0.5%)
rash	3 (1%)	1 (0.5%)
AV block second degree	2 (0.6%)	—

In addition, the following events were reported infrequently (less than 1%) or have been observed in angina trials. In many cases, the relation to drug is uncertain.

Cardiovascular: Angina, arrhythmia, bundle branch block, tachycardia, ventricular extrasystoles, congestive heart failure, syncope.

Nervous System: Amnesia, depression, gait abnormality, hallucinations, nervousness, paresthesia, personality change, tinnitus, tremor, abnormal dreams.

Gastrointestinal: Anorexia, diarrhea, dysgeusia, mild elevations of SGOT, SGPT and LDH (see hepatic warnings), vomiting, weight increase, thirst.

Dermatological: Petechiae, pruritus, photosensitivity, urticaria.

Other: Amblyopia, CPK increase, dyspnea, epistaxis, eye irritation, hyperglycemia, sexual difficulties, nasal congestion, nocturia, osteoarticular pain, impotence, dry mouth.

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme and leukopenia. Definitive cause and effect relationship between these events and CARDIZEM therapy cannot yet be established.

MRI UPDATE

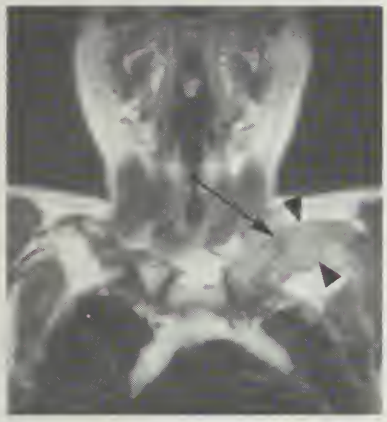

Figure 1

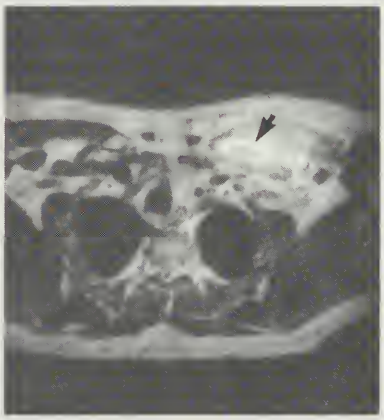

Figure 2

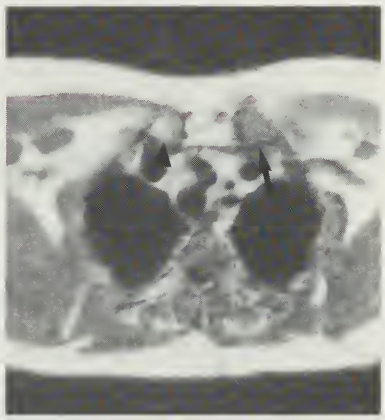

Figure 3

HISTORY: This patient is a 45 year old male who, on minor trauma, felt a popping sensation in his left sterno-clavicular region. Diffuse swelling developed and progressed down the left anterior chest wall over the next few weeks. A CT scan demonstrated a fracture of the midportion of the clavicle with minimal asymmetry of the soft tissues.

MRI FINDINGS:

Coronal images demonstrated disruption of the midportion of the left clavicle (Fig. 1, long arrow) with intermediate signal intensity material extending into the adjacent muscles (arrowheads). Transverse T2 weighted images (Fig. 2) show an area of increased signal intensity in the region of the clavicular fracture with extensive intermediate signal intensity material extending into the surrounding muscles. The high signal area most likely represents a hematoma surrounding the fracture (short arrow). The more diffuse intermediate signal represents diffused blood and/or edema in the surrounding muscles. T1 weighted images (Fig. 3) demonstrated low signal in the region of the clavicle near the sternoclavicular joint (small arrow, compare to high signal of right clavicle, arrowhead). The low signal indicates a bone marrow replacing process. Given the history of fracture following minor trauma, low signal intensity within the left clavicle increases suspicion of underlying malignancy rather than post traumatic edema. Biopsy showed undifferentiated carcinoma.

MRI HIGHLIGHTS:

While the fracture and minimal asymmetry of the soft tissues can be identified on the CT scan, this case illustrates the superior soft tissue contrast differentiation of MRI. Changes that are difficult to appreciate on the CT scan become obvious on MRI, which is rapidly becoming the method of choice for evaluating occult soft tissue abnormalities.

In the Matter of
Nicholas Michael Azzato MD
Before the
Maryland Board of
Physician Quality Assurance

Findings of Fact
Conclusions of Law, and Order

On June 21, 1988, after a hearing before the Commission on Medical Discipline (the "Commission") on April 5, 1988, the Commission found that Nicholas Michael Azzato MD ("Respondent") committed the following prohibited acts under the Medical Practice Act, Health Occupations Article, *Annotated Code of Maryland, 1987 Supplement* (the "Act"):

> Fraudulently or deceptively uses a license; 14-504(2) of the Act
> Is guilty of immoral conduct in the practice of Maryland; 14-504(3) of the Act
> Is convicted of or pleads guilty or *nolo contendere* with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction set aside; 14-504(6) of the Act
> Is addicted to or habitually uses narcotics or controlled dangerous substances as defined in Article 27 of the Code. 14-504(9)

The Commission suspended Respondent's license for a year, retroactive to December 21, 1987,[1] and placed Respondent on probation. The Commission ordered, *inter alia*, that:

1. Respondent shall participate in:
   a. Group therapy at a group therapy program approved by the Commission, at least one session per week;
   b. Individual therapy at an individual therapy program approved by the Commission, for at least one session per week, with the health professional providing the individual therapy to issue a report of Respondent's progress to the Commission every six months, the first report to be issued one month after the date of this Order; and
   c. Narcotics Anonymous for at least 6 sessions per week with no more than one session per day to be counted for the purposes of this Order;
2. That Respondent shall have a urinalysis done randomly, supervised, and at least once per week in a program approved by the Commission with copies of the results provided to the Commission.

The Order further provided that

(I)f Respondent violates any of the foregoing conditions of probation, the stay on the suspension may be lifted and the Commission, after notification, a hearing, and determination of violation, may impose any additional disciplinary sanctions it deems appropriate.

Respondent did not appeal from the Order. On November 23, 1988 the Board of Physician Quality Assurance, the successor agency under Senate Bill 508 to the Commission on Medical Discipline, charged Respondent with violation of the June 21, 1988 Order. Specifically the Board charged that Respondent violated the following conditions of probation.

1a. Respondent shall participate in group therapy at a group therapy program approved by the Commission, at least one session per week;

1b. Respondent shall participate in individual therapy at an individual therapy program approved by the Commission, for at least one session per week, with the health professional providing the individual therapy to issue a report of Respondent's progress to the Commission every six months, the first report to be issued one month after the date of this Order.

1c. Respondent shall participate in Narcotics Anonymous for at least 6 sessions per week with no more than one session per day to be counted for the purposes of this Order;

2. [That] Respondent shall have a urinanalysis done randomly, supervised, and at least once per week in a program approved by the Commission with copies of the results provided to the Commission.

Respondent was served with the Board's charges on November 23, 1988, and by letter dated November 30, 1988 a copy of the Charges were sent to Respondent's attorney of record. A hearing was scheduled on Wednesday, December 14, 1988 at 1 p.m. Respondent requested a postponement and agreed not to return to the practice of medicine until such time as the charges against him were resolved. The hearing was scheduled for January 11, 1989 at 3 p.m. before the Board, and held that day.

Board members heard evidence in the case. Respondent acknowledged that he understood that he was entitled to be requested a postponement, and Respondent stated that he wanted to proceed with the hearing.

On the record, Dr. Weiner explained to the State and Respondent the procedures that would be followed in the hearing. Dr. Weiner stated that the hearing was on the issue of whether Dr. Azzato had violated the conditions of probation of the June 21, 1988 Order as set forth in the Board's charging document of November 23, 1988. The State would have the burden of going forward, the burden of proof and the standard of proof was clear-and-convincing evidence. Both the State and the Respondent waived their rights to present opening statements and closing arguments.

The State introduced the following documentary evidence.

[1] On December 18, 1987 the Commission summarily suspended Respondent's license pursuant to State Government Article, 10-405(b). Respondent had not been practicing medicine since that date.

1. The Order of June 21, 1988 consisting of nine (9) pages.

2. A report for the National Health Laboratories of Vienna, Virginia on results on urine screens consisting of three (3) pages.

3. A letter dated 9/20/88 from Joseph A. Jurand MD to "Dear Sir or Madam" received by the Maryland State Board of Physician Quality Assurance on September 29, 1988 consisting of one (1) page.

4. A letter dated October 14, 1988, from Judith Griffith.

5. An undated hand-written letter from Respondent to Judith Griffith received by the Maryland State Board of Physician Quality Assurance dated October 31, 1988, consisting of four (4) pages which forwarded three (3) pages of certification of attendance from Narcotics Anonymous.

6. An undated letter from Beverly M. McLeod, Manager of the National Health Laboratories received by the Maryland State Board of Physician Quality Assurance on November 7, 1988 consisting of one (1) page.

7. A report of the National health Laboratories of Vienna, Virginia on the results on urine screens consisting of six (6) pages; and

8. A package entitled "Addendum to Closed Agenda Packet, Nicholas Azzato MD, November 9, 1988, Confidential" consisting of thirty four (34) pages.

Findings of Fact

Based on the evidence presented at the Hearing on Violation of Probation, the Board of Physician Quality Assurance, by a majority vote of those members hearing the evidence, finds as follows:[2]

1. Respondent has been attending individual therapy sessions once a week and has been attending two (2) group therapy sessions a week.

2. Neither the Board of Physician Quality Assurance nor the Commission on Medical Discipline approved the individual or group therapy programs.

3. Respondent attended Narcotics Anonymous on the following days in the following months.

a. August 1988: the 2nd, the 9th, the 13th, the 20th, and the 24th for a total of five (5) times.

b. September 1988: the 6th, the 13th, the 10th, the 14th, the 20th and the 28th for a total of six (6) times.

c. October 1988: the 8th, the 22nd and the 26th for a total of three (3) times.

4. From August 1, 1988 until October 31, 1988 there are thirteen weeks. Respondent was required to attend seventy-eight (78) Narcotics Anonymous sessions. Respondent attended fourteen (14) Narcotics Anonymous sessions.

5. Respondent has not attended Narcotics Anonymous six (6) times a week.

6. Respondent was required to give urine samples at least once a week from the date of the Order of June 21, 1988.

7. Respondent gave urine samples on the following days 8/22/88; 9/09/88; 9/21/88; 10/05/88; 10/14/88; 10/20/88; 10/27/88; 10/31/88; and 11/09/88 for a total of nine (9) times.

8. From August 1, 1988 until November 9, 1988 there are fourteen (14) weeks. Respondent gave urine samples nine (9) times.

9. Respondent did not give urine samples at least once a week.

10. Ms. Griffith testified that when she talked to Ms. McCleod from the National Health Laboratories of Vienna, VA regarding the urine samples given by Respondent Ms. McCleod stated that the urine samples were unsupervised. The evidence submitted by the state indicated that the Board had received a letter from Ms. McCleod that the urine samples were supervised. The letter submitted by Ms. McCleod was undated and was not on a letterhead. (There was a handwritten letterhead inserted although the letter was typed.) The letter did not indicate the protocol for observing the urine samples. The letter also indicated that the urine samples were given randomly. Respondent testified that he did not give random samples but went to the Laboratory on his own. The Board does not find the letter credible. The Board finds Ms. Griffith's testimony as to her conversation with Ms. McCleod credible.

11. Respondent has not given supervised urine samples.

12. Respondent has not given random urine screenings.

13. Respondent's urine screen program was approved by neither the Board nor the Commission.

Conclusions of Law

Based on the foregoing Findings of Fact, the Board, by a majority vote of the members of the Board considering this case, finds that Respondent VIOLATED conditions of probation of the June 21, 1988 Order as follows:

1a. Respondent DID NOT participate in group therapy at a group therapy program approved by the Commission;

1b. Respondent DID NOT participate in individual therapy at an individual therapy program approved by the Commission;

1c. Respondent DID NOT participate in Narcotics Anonymous for at least 6 sessions per week;

2. Respondent DID NOT have a urinanalysis done randomly, supervised, and at least once per week in a program approved by the Commission.

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is this 30th day of January 1989 by a

[2] Israel H. Weiner MD, Chair, after conducting the hearing recused himself from any consideration of the findings of fact, conclusions of law and order in this case.

majority vote of those members of the Board of Physician Quality Assurance of Maryland who considered this case:

ORDERED that Respondent's license to practice medicine in the State of Maryland, heretofore issued to the Respondent is hereby SUSPENDED for three (3) years; and be it further

ORDERED that Respondent SHALL comply with the following conditions of PROBATION:

1. Respondent must remain drug and alcohol free.

2. Respondent must attend two (2) group therapy sessions a week in a program approved by the Board. The Board will submit to Respondent within fourteen (14) days from the date of the Order a list of approved therapists in Respondent's geographical area. The psychiatrist shall not be an individual with whom the Respondent has a personal or former collegial relationship. If the Respondent has a personal or collegial relationship with any therapist on the list the Respondent shall inform the Board fourteen (14) days from the date of receipt of the list and the Board will submit another name.

3. Respondent must attend individual therapy sessions with a psychiatrist who is knowledgeable in drug and alcohol abuse and is approved by the Board. The Board will submit to Respondent within fourteen (14) days from the date of the Order a list of at least three (3) approved therapists in Respondent's geographical area. The psychiatrist shall not be an individual with whom the Respondent has a personal or former collegial relationship. If the Respondent has a personal or collegial relationship with any therapist on the list the Respondent shall inform the Board fourteen (14) days from the date of receipt of the list and the Board will submit another name.

4. The therapist must submit to the Board a monthly report indicating how Respondent is coping with his problems that led to his dependence on chemical substances. The report will be due the first Monday of every month. In the event that Respondent terminates therapy prior to discharge by the therapist the therapist shall immediately notify the Board in writing;

5. Respondent must attend three (3) Narcotics Anonymous meetings or Alcoholic Anonymous meetings each week and submit certification of attendance to the Board by a letter postmarked each Monday.

6. Respondent must have supervised random urine screens performed at least once a week in a program whose protocols are approved by the Board. The protocols must contain a provision for verifying a positive screen. Once the protocols are approved by the Board they are incorporated herein by reference. The urine screens must test for marijuana as well as cocaine and alcohol. The results of the urine screens must be sent to the Board and the Respondent's therapist.

7. Respondent shall take hundred (100) credits of continuing education, approved by the Board within six (6) months of the date of this Order. These credits of continuing education may be counted as part of the continuing education requirements necessary for renewal of Respondent's license.

8. Within thirty (30) days of the date of this Order, Respondent must enter into a contract with the Impaired Physicians' Rehabilitation Committee at the Medical and Chirurgical Faculty (the "Committee") and comply with all terms of the contract. The contract must be approved by the Board and must provide that the Committee will notify the Board if Respondent fails to comply with ANY term of the contract. The contract must indicate who is Respondent's contact person, and who will be the person monitoring Respondent's compliance with the contract. The contract, once approved, will be incorporated herein by reference. The Committee shall provide the Board with monthly reports, the first due on the first Monday of every month indicating whether Respondent is in compliance with the terms of his contract; and be it further

ORDERED that six (6) months from the date of this Order Respondent may petition the Board to stay the suspension of his license in order that he may practice medicine. Respondent must submit evidence that he has complied with all terms of probation. Respondent must present to the Board his plans for returning to the practice in order to assure that the public health, welfare, and safety are protected. These limits may include that Respondent's medical practice will be supervised and/or evaluated, and may prohibit Respondent from prescribing controlled dangerous substances. At that time the Board may revise their terms of Respondent's probation and re-evaluate Respondent's need for continued therapy. The Board may request that Respondent's therapist address the Board as to the progress Respondent has made in therapy; and be it further

ORDERED that if the Respondent violates any of the foregoing conditions of probation, the Board, after notification and a hearing may discontinue the Respondent's probation and impose any disciplinary sanctions it deems appropriate including revocation of Respondent's license; and be it further

ORDERED that if the Board receives a report from the Committee, Respondent's supervisor or therapist indicating that Respondent is not drug or alcohol free the Board, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD MAY REVOKE RESPONDENT'S LICENSE, provided that Respondent is given immediate notice of the charges and an opportunity to be heard thirty (30) days after requesting same; and be it further

ORDERED that this a final order.

FRANK A. GUNTHER JR., Vice Chair
Maryland Board of Physician Quality Assurance

In the Matter of
Reza Feiz MD
Before the
Maryland Board of
Physician Quality Assurance

Order Terminating Probation and Reinstating License

By Order (attached hereto) dated June 18, 1985 (the "1985 Order"), the Board of Physician Quality Assurance (the "Board"), successor agency to the Commission on Medical Discipline, found Reza Feiz MD (the "Respondent") guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated Code of Maryland* ("HO") -14-504. Specifically, the Board found that Respondent pled guilty to *nolo contendere* with respect to a crime involving moral turpitude whether or not any appeal or other proceeding is pending to have the conviction or plea set aside (recodified as 14-504(b)(1) of the Health Occupations Article). The Board suspended the medical license of Respondent, immediately staying the suspension, conditioned upon the Respondent complying with conditions of probation (the "Conditions of Probation"). The Order further provided that after three (3) years from the date of the Order, if the Respondent demonstrated to the Board's satisfaction that he had complied with the terms and conditions of his probation, the Board would entertain a petition for termination of Respondent's probationary status and reinstatement of his medical license. By letter dated June 29, 1988, Respondent petitioned for reinstatement of his license to practice medicine in Maryland. At its meeting on December 14, 1988, the Board reviewed Respondent's petition for reinstatement. Based on its review of the petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1985 Order.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent has not engaged in activities of the type that led to his criminal conviction;
2. Respondent has obeyed all laws;
3. Respondent arranged for the results of record checks performed as a condition of his Court ordered probation to be forwarded to the Board;
4. Respondent continued with his treating psychotherapist until the Board was notified that such treatment was no longer recommended;
5. Respondent arranged for the forwarding of a psychiatric report to the Board every six (6) months for the duration of his probation;
6. Respondent practiced only under supervision or under an alternative arrangement approved by the Board;
7. Respondent did not undertake to treat on a regular basis children or adolescents without applying to the Board for approval; and
8. Respondent arranged for his supervisor to forward a report of his performance every six (6) months for the duration of his probation.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions as set forth in the Order of June 18, 1985.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 14th day of December 1988 by a unanimous vote of a quorum of the Board

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1985 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland be REINSTATED without any condition or restriction whatsoever; AND IT IS FURTHER

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In the Matter of
Rashid Gill MD
Before the
Maryland Board of
Physician Quality Assurance

Order Terminating Probation and Reinstating License

By Order (attached hereto) dated March 18, 1986 (the "1986 Order"), the Board of Physician Quality Assurance (the "Board"), successor agency to the Commission on Medical Discipline, found Rashid Gill MD (the "Respondent") guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated Code of Maryland* ("HO") 14-504. Specifically, the Board found that Respondent practices medicine with an unauthorized person or aids an unauthorized person in the practice of medicine (recodified as 14-504(a)(18) of the Health Occupations Article). The Board suspended the medical license of Respondent, immediately staying the revocation, conditioned upon the Respondent complying with terms and conditions (the "Conditions of Probation"). The Order further provided that after two (2) years from the date of the Order, if the Condi-

tions of Probation have not been violated, the Board would entertain a petition for termination of Respondent's probationary status and reinstatement of his medical license.

On July 8, 1988 Respondent petitioned the Board for reinstatement of his license to practice medicine in Maryland. At its meeting on September 14, 1988, the Board reviewed Respondent's petition for reinstatement. Based on its review of the petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1986 Order.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent did not engage in a contract of employment that would result in the practice of medicine with an unauthorized person or require the Respondent to aid an unauthorized person in the practice of medicine;
2. Respondent submitted to the monitoring of his prescriptions for controlled dangerous substances by submitting on a monthly basis beginning the first Monday in the month following the issuance of this Order, copies of all prescriptions containing controlled dangerous substances on prescription forms mechanically numbered in seriation; and
3. The Chairman of the Committee on Drugs concluded that further review or monitoring of Dr. Gill's practice was not necessary.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions as set forth in the Order of March 18, 1986.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 14th day of September 1988 by a unanimous vote of a quorum of the Board:

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1986 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland be REINSTATED without any condition or restriction whatsoever; AND IT IS FURTHER

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

■ ■ ■

In the Matter of Francis A. Zampiello MD

Before the Maryland Board of Physician Quality Assurance

Final Consent Order

Based on information received from the Massachusetts Board of Registration in Medicine, the Board of Physician Quality Assurance (the "Board") charged Francis A. Zampiello MD ("Respondent") under 14-504(21) and (25) of the Maryland Medical Practice Act, (the "Act"), Title 14, Health Occupations Article, *Annotated Code of Maryland*. Section 14-504 of the Act permits the Board to impose sanctions on a licensee who:

> (21) Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country or disciplined by any branch of the United States uniformed services or the Veterans' Administration for an act that would be ground for disciplinary action under [Section 14-504], to wit: Section 14-504(4) Is professionally, physically or mentally incompetent; or
>
> (25) Was subject to investigation or disciplinary action by a licensing or disciplinary authority or by a court of any state or country for an act that would be ground for disciplinary action under [Section 14-504], to wit: Section 14-504(4), and the licensee:
>
> (ii) Allowed the license issued by the state or country to expire or lapse.

In November 1988 the Respondent was notified by letter of these charges and the factual basis of the charges. On January 4, 1989, the Respondent attended a Settlement Conference. During the course of that conference, the Respondent agreed to enter into a Consent Agreement with the Board, thereby consenting to the following Findings of Fact, Conclusions of Law, and Order.

Findings of Fact

The Board makes the following findings of fact:

1. The Respondent, Francis A. Zampiello MD, was and is licensed to practice medicine in the State of Maryland at all times relevant to the charges herein.
2. The Respondent was licensed to practice medicine in the Commonwealth of Massachusetts from the year 1970 to February 15, 1982.
3. The Massachusetts Board of Registration in Medicine initiated an investigation of the Respondent on July 12, 1978. This investigation focused on the Respondent's allegedly incompetent treatment of his five-year-old patient, who died of epiglottitis on June 25, 1978 while under his care.

4. With respect to that investigation, Adjudicatory Case No. 533-EG was commenced against Respondent before the Massachusetts Board of Registration of Medicine by an *Order to Show Cause* issued on April 17, 1980 and mailed to the Respondent on the same date.

5. On June 29, 1981, having received a copy of *Complaint Counsel's Motion to Compel Respondent to File an Answer to the Order to Show Cause*, Respondent denied having received the *Order to Show Cause* and requested a copy.

6. On July 6, 1981, Massachusetts Complaint Counsel, James Barrett, mailed a copy of the *Order to Show Cause* to Respondent.

7. During 1982, Respondent failed to renew his Massachusetts license to practice medicine and allowed his license to lapse on February 15, 1982 while he was still subject to disciplinary action by reason of Adjudicatory Case No. 533-EG.

8. On August 2, 1982, the Massachusetts Board issued an Amended *Order to Show Cause* in Case No. 533-EG.

9. On November 18, 1987, the Massachusetts Board of Registration in Medicine issued the attached Order, which is incorporated into these Findings, disciplining the Respondent for violations of Massachusetts General Laws Ch. 112, Sec. 5 (a)(3) and (61). With respect to the Respondent's treatment of Nicole Alves, the Massachusetts Board specifically found the Respondent guilty of conduct, including gross negligence, demonstrating his incompetence to practice medicine.

10. Section 14-504(4) of the Maryland Act allows the Board to discipline and impose sanctions against a licensee on the ground that the licensee is professionally, physically, or mentally incompetent.

Conclusions of Law

Based on the foregoing Findings of Fact, the Board hereby concludes as a matter of law that the Respondent is GUILTY of having been disciplined by a licensing of disciplinary authority...of any state... for an act that would be ground for discipline under [the Act], to wit: Section 14-504(4) of the Act [Section 14-504(21)]. The Board DISMISSES the charge of 14-504(25) of the Act.

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is hereby ORDERED this 14th day of January 1989, that the Respondent is hereby REPRIMANDED; and be it further

ORDERED that within one year from the date of this Order, the Respondent must complete fifty (50) hours of continuing education (category one) in pediatric medicine and provide the Board with documentation proving that he has done so; and be it further

ORDERED that if the Respondent chooses to practice clinical medicine in the State of Maryland at some future date, he shall notify the Board, provide evidence demonstrating his competence to practice clinical medicine and obtain Board approval prior to practicing clinical medicine in Maryland.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby admit the truth of the Findings of Fact, and accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of the Order, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.

I sign this Order without reservation, and I fully understand its meaning.

YOCON®
YOHIMBINE HCl

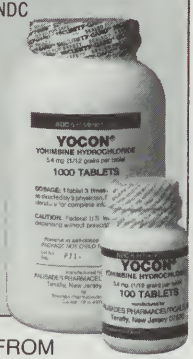
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

What is PDS?

PDS is a professional service company for physicians. PDS helps the physician obtain the best benefit for the disabled patient who is applying for Social Security Disability Insurance benefits or seeking vocational rehabilitation.

- **Team up with PDS** and help disabled patients get benefits sooner. You examine the patient, order tests, and furnish results to a nurse from our directory.
- **You receive a typed disability report,** reviewed by a professional, ready for your signature, with full supporting medical documentation.
- **PDS frees you from paperwork,** yet assures that you can file a thorough, timely disability report with Social Security.

When your patients need your best health care recommendations use your head.

Remember this hat.

When your patients need home health care remember to recommend Staff Builders. Our nurses (RN/LPN), therapists (physical/occupational/speech), medical social workers, nurses aides, home health/personal care aides, home-makers, live-in home companions are all carefully screened, bonded, insured and professional in every way. But more than that, they care. So remember Staff Builders when you recommend health care services. And remember most home health services are paid by Medicare, Medical Assistance, or Blue Cross. And that hospital and home private duty services are also available. Staff Builders personal and professional care is as close as your phone. Just give us a call if we can be of assistance.

Licensed by the State of Maryland and Federally Certified for Medicare/Medical Assistance/Blue Cross-Home Care.

Available every hour 7 days a week.

MARK EPSTEIN DEVELOPMENT CO.

"When the ultimate isn't quite good enough"

DAY 821-1545
EVE./WEEKENDS 653-5091

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $5 million for individual doctors and $7.5 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

OVER A CENTURY AGO,

a thousand visionary physicians across the nation bestowed a commemorative stone carving to the Washington Monument. This patriotic display symbolized their unrelenting devotion to a new republic founded on freedoms—including the freedom to practice medicine for the best possible health of all its people. *Today your help is needed to restore this symbol of our profession.*

Because the commemorative stone has suffered from severe erosion and defacement, the American Medical Association is launching a campaign to raise money from physicians to restore this symbol of medicine for the National Park Service. Every contribution made to this effort will serve as a statement of each physician's personal affirmation and commitment to health and medicine in America.

Please take part in rededicating the commemorative stone as a shining example of the strength of medicine in a free and strong society. Contributors who donate $100 or more will receive a memorial replica of the carving as a token of appreciation. Send your tax deductible contribution for this timeless symbol today. Thank you.

AMA AMERICAN MEDICAL ASSOCIATION

NATIONAL PARK SERVICE Department of the Interior

Yes, I want to affirm my commitment to health and medicine in America. Please accept my contribution for:

_____ Other
_____ $100
_____ $50
_____ $25

Address _____

City/State/Zip _____

All donations are tax deductible. All contributions will be publicly recognized in an unveiling ceremony for the new stone when it is fully restored.

Thank you for your contribution.

AXID®

nizatidine

Enhances compliance and convenience

Patients appreciate Axid, 300 mg, in the Convenience Pak

In a Convenience Pak survey (N = 100)[1]

- 100% said the directions on the Convenience Pak were clear and easy to understand
- 93% reported not missing any doses

Pharmacists save time – at no extra cost

- The Convenience Pak saves dispensing time and minimizes handling

The Convenience Pak promotes patient counseling

- Pharmacists dispensing the Axid Convenience Pak can encourage compliance and continued customer satisfaction

Convenience Pak is available at no extra cost

Additional information available to the profession on request.

AXID®

nizatidine capsules

Brief Summary

Consult the package literature for complete information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients at a reduced dosage of 150 mg h.s. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General* — 1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests — False-positive tests for urobilinogen with Multistix® may occur during therapy with nizatidine.

Drug Interactions — No interactions have been observed between Axid and theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility — A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy — Teratogenic Effects — Pregnancy Category C — Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers — Studies conducted in lactating women have shown that <0.1% of the administered oral dose of nizatidine is secreted in human milk in proportion to plasma concentrations. Caution should be exercised when administering nizatidine to a nursing mother.

Pediatric Use — Safety and effectiveness in children have not been established.

Use in Elderly Patients — Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among reported adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs < 0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic — Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients and was possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L) and, in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular — In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS — Rare cases of reversible mental confusion have been reported.

Endocrine — Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic — Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H_2-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental — Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity — As with other H_2-receptor antagonists, rare cases of anaphylaxis following administration of nizatidine have been reported. Because cross-sensitivity in this class of compounds has been observed, H_2-receptor antagonists should not be administered to individuals with a history of previous hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other — Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine administration have been reported.

Overdosage: Overdoses of Axid have been reported rarely. The following is provided to serve as a guide should such an overdose be encountered.

Signs and Symptoms — There is little clinical experience with overdosage of Axid in humans. Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous median lethal doses in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

Treatment — To obtain up-to-date information about the treatment of overdose, a good resource is your certified regional Poison Control Center. Telephone numbers of certified poison control centers are listed in the *Physicians' Desk Reference (PDR)*. In managing overdosage, consider the possibility of multiple drug overdoses, interaction among drugs, and unusual drug kinetics in your patient.

If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance.

PV 2096 AMP [013089]

THE SECRET IS OUT

"While I was attending one of Southern Medical's Annual Meetings, I became acquainted with the Dial Access program which provides medical information through a toll-free number. It has been very useful to have access to recent taped information that is very brief and very current."

Marie L. Michelson, M.D.
Pathology
Chattanooga, TN

Since 1906, the Southern Medical Association has been the best kept secret in the South. No longer! The word is out and everybody's talking.

They're talking about the educational benefits of belonging to the largest regional multi-specialty association in the U.S. and the diversity of the Annual Scientific Assembly.

They're talking about a non-political association whose only mission is to provide the best educational and financial benefits available anywhere.

They're also talking about unrivaled member benefits including the SMA Insurance Program, the Physicians' Purchasing Program, the SMA Retirement Program, SMA Travel Services, Dial Access, the *Southern Medical Journal* and many, many more.

But most of all, they're talking about how SMA can offer so much at such a low cost.

Call the SMA for more information and a membership application. Find out why more and more physicians are joining the SMA every day.

Join the SMA today . . . You'll be talking about us too!

In moderate depression and anxiety

- 74% of patients experienced improved sleep after the first *h.s.* dose[1]
- First-week improvement in somatic symptoms[1]
- 50% greater improvement with Limbitrol in the first week than with amitriptyline alone[2]

Protect Your Prescribing Decision: Specify "Do not substitute."

Limbitrol®

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) Ⓥ

Limbitrol® DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) Ⓥ

References: 1. Data on file, Hoffmann-La Roche Inc., Nutley, NJ. 2. Feighner JP, *et al: Psychopharmacology 61*:217-225, Mar 22, 1979.

Limbitrol®Ⓥ
Tranquilizer—Antidepressant
Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants; concomitant use with MAOIs or within 14 days of monoamine oxidase inhibitors (then initiate cautiously, gradually increasing dosage until optimal response is achieved); during acute recovery phase following myocardial infarction.

Warnings: Use with caution in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur when used with anticholinergics. Closely supervise cardiovascular patients. Arrhythmias, sinus tachycardia, prolongation of conduction time, myocardial infarction and stroke reported with tricyclic antidepressants, especially in high doses. Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving).

***Usage in Pregnancy:* Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations. Consider possibility of pregnancy when instituting therapy.**

Withdrawal symptoms of the barbiturate type have occurred after discontinuation of benzodiazepines (see Drug Abuse and Dependence).

Precautions: Use cautiously in patients with a history of seizures, in hyperthyroid patients, those on thyroid medication, patients with impaired renal or hepatic function. Because of suicidal ideation in depressed patients, do not permit easy access to large quantities of drug. Periodic liver function tests and blood counts recommended during prolonged treatment. Amitriptyline may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady-state concentrations of the tricyclic drugs. Use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Should not be taken during the nursing period or by children under 12. In elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects. Inform patients to consult physician before increasing dose or abruptly discontinuing this drug.

Adverse Reactions: Most frequent: drowsiness, dry mouth, constipation, blurred vision, dizziness, bloating. Less frequent: vivid dreams, impotence, tremor, confusion, nasal congestion. Rare: granulocytopenia, jaundice, hepatic dysfunction. Others: many symptoms associated with depression including anorexia, fatigue, weakness, restlessness, lethargy.

Adverse reactions not reported with Limbitrol but reported with one or both components or closely related drugs: *Cardiovascular:* Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke. *Psychiatric:* Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania, increased or decreased libido. *Neurologic:* Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns. *Anticholinergic:* Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract. *Allergic:* Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus. *Hematologic:* Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia. *Gastrointestinal:* Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue. *Endocrine:* Testicular swelling, gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion. *Other:* Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Drug Abuse and Dependence: Withdrawal symptoms similar to those noted with barbiturates and alcohol have occurred following abrupt discontinuance of chlordiazepoxide; more severe seen after excessive doses over extended periods; milder after taking continuously at therapeutic levels for several months. Withdrawal symptoms also reported with abrupt amitriptyline discontinuation. Therefore, after extended therapy, avoid abrupt discontinuation and taper dosage. Carefully supervise addiction-prone individuals because of predisposition to habituation and dependence.

Overdosage: Immediately hospitalize patient. Treat symptomatically and supportively. I.V. administration of 1 to 3 mg physostigmine salicylate may reverse symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

How Supplied: *Double strength (DS) Tablets,* white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and *Tablets,* blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt)—bottles of 100 and 500; Tel-E-Dose® packages of 100; Prescription Paks of 50.

Maryland. Tried & True.

It's true. In today's rapidly changing health care environment, your professional liability insurance must be strong, stable, and reliable. You shouldn't have to worry about whether your company will still be here to protect you in the future.

For more than a decade, thousands of Maryland physicians have found the protection they need with Medical Mutual Liability Insurance Society of Maryland. A financially sound, conservatively managed specialty insurer, Medical Mutual is recognized as expert in the area of professional liability insurance.

Backed by a professional staff with years of experience in underwriting, claims handling, and risk management, our professional liability insurance provides strong, reliable protection—plus the expertise, service and attention that only a specialty insurer can offer.

We are proud to be serving thousands of your colleagues already, Maryland physicians who have found the right combination of protection, flexibility, and service for their practices. If you haven't met us yet, call your broker or call our Member Services Department at 1-800-492-0193.

Medical Mutual. Try us and see what we can do for you.

Treat your practice with the same care you give your patients.

With billing getting more complicated every day, more physicians are depending on computers to streamline the billing process and maintain cashflow. But without strong customer support, computers can aggravate problems instead of solving them.

That's why you need Sentient—a solid local company offering an excellent computer system with effective long-term support. Each Sentient system comes with the training, software and the ongoing support you'll need to adapt to the latest changes in carrier and regulatory requirements. We're always there for you with new enhancements, advice, and to answer questions. For a free consultation call Sentient today.

A Choice.

Just what the doctors ordered.

No physician wants to be sued for malpractice. But it happens. And if it happened to you, wouldn't you prefer to be insured with the company that puts your professional reputation first?

When you choose Princeton, you choose a company that vigorously defends its policyholders against meritless lawsuits. We will not compromise your professional integrity in the name of a hasty settlement. And we have a proven track record. More than 93% of the court cases we manage are resolved in favor of the insured.

Contact one of the independent insurance agents that represent Princeton for more information about our claims management and exclusive *Occurrence Plus* professional liability protection.

The choice is yours.

Information for Authors

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if the manuscript is not accepted.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal jEditors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

Page proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Could Your Malpractice Insurer Become Insolvent?

> Concern is mounting among public officials and analysts that a financial crisis is brewing in the insurance industry.
>
> * * *
>
> . . . there have been an average of 18 insurance failures in each of the last four years. . .
>
> *New York Times, April 15, 1989, Front Page*

Insurance companies do not have to be small to fail. Two insurance company insolvencies in 1987 accounted for failures of $1.3 billion. Many Maryland physicians are already experiencing the fear of going "bare" due to the insolvency of Mutual Fire.

The issues are complex. They concern determinations of adequate reserves for future claims, and proper underwriting and defense, among other issues. An OB GYN can be sued up to 21 years from the date of a childbirth for an alleged incident. The doctor may or may not be practicing at that time. If inadequate reserves are maintained, the same may be true of the insurer. Can you make the necessary evaluations? Do you know what questions to ask?

We are sure you have heard the maxim, "Where there is smoke there is fire." Competition among Maryland malpractice insurers has stirred up plenty of smoke. Do not count on the contentions of the companies alone for answers.

You need a broker you can rely on

As an independent broker with direct writing authority, Contemporary Insurance Services can advise you concerning all available carriers. *If you have recently switched carriers and are having second thoughts, call on us for an evaluation of your situation.* We are one of the largest agencies for the sale of malpractice insurance to Maryland physicians. Do not wait until your policy is up for renewal. Return the form below or call us for an evaluation of your policy.

Name_____

Address_____

_____

Phone No. Home: ( ) _____ Work: ( ) _____

Medical Specialty_____ Percentage of Practice outside the state of Maryland_____

Policy Renewal Date_____ Retroactive Date_____ Insurer_____

Please return this form with copies of the first two pages of your malpractice policies. If there is more than one physician in your practice, a copy of this form should be completed for each physician in your group.

advocate
′ad-və-kət-, kāt\n
1: one that pleads the cause of another; specif: one that pleads the cause of another before a tribunal or judicial court 2: one that defends or maintains a cause or proposal

THE MEDICAL AND CHIRURGICAL FACULTY-*Physician Rehabilitation Committee*
The very definition of **ADVOCATE**

The Committee, in addition to being **CONFIDENTIAL** and **NONDISCIPLINARY**, acts as an advocate for physicians utilizing, in a cooperative atmosphere, the services of the Committee.

Areas of advocacy include matters of licensure, credentialing, and employment. Addiction, Marital/Family conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap... If these are some of the problems, we can help you find the solutions

In Maryland the Physician Rehabilitation Committee of MED-CHI is available to all physicians, and their families.
The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL.
If you, a colleague, or family member is in need of our services call:

JUNE 1989

CONSENT FORMS FOR POLIO AND ORAL POLIO VACCINE AND DIPHTHERIA, TETANUS, AND PERTUSSIS AND DTP, DT, AND TD VACCINES

Physicians have to provide adequate information to patients prior to administration of polio and DTP vaccines. The consent forms used in public health clinics may be useful in ensuring all pertinent facts are told to the patient prior to the administration of the vaccines. Following are the current copies of the consent forms, and these may be duplicated as necessary. Periodic revisions occur, with a major revision anticipated in early 1990.

IMPORTANT INFORMATION ABOUT POLIO AND ORAL POLIO VACCINE

Please read this carefully

OP 3/1/83

WHAT IS POLIO? Polio is a virus disease that may cause permanent crippling (paralysis) and occasionally death. There used to be thousands of cases and hundreds of deaths from polio every year in the United States. Because of the widespread use of polio vaccines, which became available beginning in the mid-1950's, polio disease has nearly been eliminated from the United States. Although thousands of cases continue to occur each year in the rest of the world, in the United States during the past 5 years there have been only 67 cases of polio reported, an average of 13 cases per year. Our success in preventing the spread of wild polio virus has been so great that most of the recent cases (approximately nine per year) have resulted from the rare side effects of oral polio vaccine (see below). Because of this fact, some people have asked why we should continue to use polio vaccine. The reason is that, even though we may not have much wild polio virus spreading here now, there is so much of it in the rest of the world that there is a great risk of its being reestablished if our children are not vaccinated.

ORAL LIVE POLIO VACCINE: Immunization with oral live polio vaccine (OPV) is one of the best ways to prevent polio. It is given by mouth starting in early infancy. Several doses are needed to provide good protection. Young children should get two or more doses in the first year of life and another dose at about 18 months of age. An additional dose is important for children when they enter school or when there is a high risk of polio, for example, during an epidemic or when traveling to a place where polio is common. The vaccine is easy to take and is effective in preventing the spread of polio. In over 90 percent of people, OPV gives protection for a long time, probably for life. Because OPV viruses live for a time in the intestinal tract of the person who is vaccinated, some of the viruses pass in the stool and can spread from the vaccinated person to those in close contact (usually household members). This may help to immunize these persons and is one of the advantages of OPV. The Immunization Practices Advisory Committee of the Public Health Service and the American Academy of Pediatrics recommend oral live polio vaccine as the preferred polio vaccine for people up to the 18th birthday.

POSSIBLE SIDE EFFECTS FROM THE VACCINE: OPV very rarely (once in about every 8.1 million doses of OPV distributed) causes paralytic polio in the person who is vaccinated. The risk may be slightly higher in adults being vaccinated and substantially higher in persons with abnormally low resistance to infection. Also very rarely (once in about every 5 million doses of OPV distributed) paralytic polio may develop in a close contact of a recently vaccinated person. Even though these risks are very low, they should be recognized. The risk of side effects from the vaccine must be balanced against the risk of the disease, both now and in the future.

(PLEASE READ OTHER SIDE)

PREGNANCY: Polio vaccine experts do not think oral polio vaccine can cause special problems for pregnant women or their unborn babies. However, doctors usually avoid giving any drugs or vaccines to pregnant women unless there is a specific need. Pregnant women should check with a doctor before taking oral polio vaccine.

WARNING—SOME PERSONS SHOULD NOT TAKE ORAL POLIO VACCINE WITHOUT CHECKING WITH A DOCTOR:

- Anyone with cancer, leukemia, or lymphoma.
- Anyone with a disease that lowers the body's resistance to infection.
- Anyone taking a drug that lowers the body's resistance to infection, such as cortisone or prednisone.
- Anyone who lives in the same household with anyone who has one of the conditions listed above.
- Anyone who is sick right now with something more serious than a cold.
- Pregnant women.
- Most persons age 18 and older because adults have a slightly bigger risk of developing paralysis from oral polio vaccine than children (However, if the risk of polio is increased-as may occur, for example, when there is an outbreak in your community-most polio experts recommend that unprotected persons receive oral polio vaccine regardless of age.)

NOTE ON INJECTABLE (KILLED) POLIO VACCINE: Besides the oral polio vaccine (OPV), there is also a killed polio vaccine (IPV) given by injection which protects against polio after several shots. This killed polio vaccine has no known risk of causing paralytic polio. Because OPV may provide lifetime protection, seems to provide stronger immunity in the intestinal tract (where infection first occurs), is simpler to administer, and is more effective in preventing the spread of polio virus than IPV, most polio experts feel that oral vaccine is more effective for controlling polio in the United States. Injectable polio vaccine is recommended for persons needing polio vaccination who have low resistance to serious infections or who live with persons with low resistance to serious infections. It may also be recommended for previously unvaccinated adults who plan to travel to a place where polio is common or for previously unvaccinated adults whose children are to be vaccinated with OPV. It is not widely used in this country at the present time, but it is available. If you would like to know more about this type of polio vaccine, or wish to receive this vaccine, please ask us.

QUESTIONS: If you have any questions about polio or polio vaccination, please ask us now or call your doctor or health department before you sign this form.

REACTIONS: If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after vaccination, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

I have read the information on this form about polio and the oral vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of oral polio vaccine and request that it be given to me or to the person named below for whom I am authorized to make this request.

IMPORTANT INFORMATION ABOUT DIPHTHERIA, TETANUS, AND PERTUSSIS AND DTP, DT, AND Td VACCINES

Please read this carefully **DTP 1/1/88**

WHAT IS DIPHTHERIA?

Diphtheria is a very serious disease which can affect people in different ways. It can cause an infection in the nose and throat which can interfere with breathing. It can also cause an infection of the skin. Sometimes it causes heart failure or paralysis. About 1 person out of every 10 who get diphtheria dies of it.

WHAT IS TETANUS?

Tetanus, or lockjaw, results when wounds are infected with tetanus bacteria, which are often found in dirt. The bacteria in the wound make a poison which causes the muscles of the body to go into spasm. In the United States, four out of every 10 persons who get tetanus die of it.

WHAT IS PERTUSSIS?

Pertussis, or whooping cough, causes severe spells of coughing which can interfere with eating, drinking, and breathing. In the United States, approximately 70 percent of reported pertussis cases occur in children younger than 5 years. Pertussis is a more serious disease in young children and more than half of the children less than 1 year of age reported to have pertussis are hospitalized. In recent years, over 2,000 cases of pertussis have been reported each year in the United States. Complications occur in a substantial proportion of reported cases. Pneumonia occurs in one of every four children with pertussis. For every 1,000 reported pertussis cases, 22 develop convulsions and/or have more severe problems of the brain. In recent years, an average of nine deaths due to pertussis occurred annually.

Before vaccines were developed, these three diseases were all very common and caused a large number of deaths each year in the United States. If children are not immunized, the risk of getting these diseases will go back up again.

DTP, DT, AND Td VACCINES:

Immunization with DTP vaccine is the best ways to prevent these diseases. DTP vaccine is actually three vaccines combined into one shot to make it easier to get protection. Advisory committees of the United States Public Health Service and the American Academy of Pediatrics recommend DTP vaccine be used in children up to their seventh birthday. The vaccine is given by injection starting early in infancy. At least three shots are needed to provide initial protection. Young children should get three doses in the first year of life and a fourth dose at about 15 months of age. A booster shot is important for children who are about to enter school and should be given between their fourth and seventh birthdays. The vaccine is very effective at preventing tetanus—over 95 percent of those who get the vaccine are protected if the recommended number of shots is given. Although the diphtheria and pertussis parts of the vaccine are not quite as effective, they still prevent most children from getting disease and they make the disease milder for those who do get it.

Because pertussis is not very common or severe in older children, those 7 years of age or older should take a vaccine that does not contain the pertussis part. Also, because reactions to the diphtheria part of the vaccine may be more common in older children, those 7 years of age and older should take a form of the vaccine that has a lower concentration of the diphtheria part. This vaccine which contains no pertussis part and a lower concentration of the diphtheria part is called Td vaccine. Boosters with the Td vaccine should be received every 10 years throughout life.

DEFERRAL OF DTP IMMUNIZATION:

Children who have had a serious reaction to previous DTP shots should not receive additional pertussis vaccine (see WARNING). A preparation called DT vaccine is available for them which does not contain the pertussis part. Also, children who have previously had a convulsion or are suspected to have a problem of the nervous system should not receive DTP vaccine until a full medical evaluation has been made.

POSSIBLE SIDE EFFECTS FROM THE VACCINE:

With DTP vaccine, most children will have a slight fever and be irritable within 2 days after getting the shot. One-half of children develop some soreness and swelling in the area where the shot was given. More serious side effects can occur.

(PLEASE READ OTHER SIDE)

A temperature of 105°F or greater may follow 1 out of 330 DTP shots. Continuous crying lasting 3 or more hours may occur after 1 in every 100 shots and unusual, high-pitched crying may occur after 1 in every 900 shots. Convulsions or episodes of limpness and paleness may each occur after 1 in every 1,750 shots. Rarely, about once in every 110,000 shots, other more severe problems of the brain may occur, and permanent brain damage may occur about once in every 310,000 shots. Side effects from DT or Td vaccine are not common and usually consist only of soreness and slight fever. As with any drug or vaccine, there is a rare possibility that allergic or more serious reactions or even death could occur.

Although some people have questioned whether DTP shots might cause Sudden Infant Death Syndrome (SIDS), the majority of evidence indicates that DTP shots do not cause SIDS.

PERSONAL OR FAMILY HISTORY OF CONVULSIONS:

Children who have had a convulsion and children who have a brother, sister, or parent who has ever had a convulsion are more likely to have a convulsion after receiving DTP vaccine. The advisory committees recommend that because of the overall risk of pertussis disease and the fact that the risk of convulsions is still very low: (1) children with a personal history of a convulsion and whose nervous system problem is stable may receive DTP vaccine; and (2) children with a family history of convulsions should receive DTP vaccine. However, you should tell the person who is to give the immunization about such a history and discuss the possibility of using an anti-fever medicine.

PREGNANCY:

Babies born under unsanitary conditions to unimmunized women have a risk of developing tetanus during the newborn period (neonatal tetanus). Neonatal tetanus can be prevented by immunization of adult women. Women who have not received Td earlier and who are thought to be at risk of delivering their babies under unsanitary conditions should be immunized during pregnancy.

Td vaccine is not known to cause special problems for pregnant women or their unborn babies. Doctors usually do not recommend giving any drugs or vaccines to pregnant women unless there is a specific need. Pregnant women who need Td vaccine should receive it, preferably during the second and/or third trimesters.

WARNING—SOME PERSONS SHOULD *NOT* TAKE THESE VACCINES WITHOUT CHECKING WITH A DOCTOR:

- Anyone who is sick right now with something more serious than a cold.
- Anyone who has had a convulsion or is suspected to have a problem of the nervous system.
- Anyone who has had a serious reaction to DTP, DT, or Td shots before, such as: an allergic reaction to any vaccine component; a temperature of 105°F or greater; an episode of limpness and paleness; prolonged continuous crying; an unusual, high-pitched cry; or a convulsion or other more severe problem of the brain.
- Anyone taking a drug or undergoing a treatment that lowers the body's resistance to infection, such as: cortisone, prednisone, certain anticancer drugs, or irradiation.
- Anyone who has had a serious reaction to a product containing thimerosal, a mercurial antiseptic.

QUESTIONS:

If you have any questions about diphtheria, tetanus, or pertussis or DTP, DT, or Td immunization, please ask us now or call your doctor or health department before you sign this form.

REACTIONS:

If the person who received the vaccine develops a temperature of 105°F or greater, continuous crying lasting 3 or more hours, an unusual high-pitched cry, a convulsion, an episode of limpness and paleness, or a severe problem of the brain, the person should be seen promptly by a doctor.

If the person who received the vaccine gets sick and visits a doctor, hospital, or clinic in the 4 weeks after immunization, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

I have read or have had explained to me the information on this form about diphtheria, tetanus, and pertussis and DTP, DT and Td vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the DTP, DT, and Td vaccine and request that the vaccine checked below be given to me or to the person named below for whom I am authorized to make this request.

Highlights: Executive Committee and Council Actions

Executive Committee - January 19, 1989

Minutes - The Executive Committee minutes of December 15, 1988 were approved as distributed.

Committee on Emergency Medical Services - In response to a request from the Washington County Medical Society, the Executive Committee addressed the matter of the refusal of Cardiac Rescue Technicians (CRTs) and Emergency Medical Technicians (EMTs) to follow orders given by licensed physicians at a medical incident. The Committee reviewed a draft letter of response to the Washington County Medical Society advising of options for CRTs and EMTs in the care and transportation of critically ill patients by public ambulance as provided in the Maryland Medical Protocols. After discussion, a motion was adopted to refer the matter to Council for action.

Continuing Medical Education Policy of Med Chi - A revised policy for Med Chi cosponsorship of continuing medical education programs was presented. During discussion, it was pointed out that fees charged for cosponsorship of CME programs would not apply to component medical societies but only to outside organizations. The Committee adopted a motion to forward the matter to Council with a recommendation for adoption.

Hospital Medical Staffs Committee - It was reported that Dr. Victor Hrehorovich has been invited to serve as a member of the JCAHO's Task Force on Quality Improvement. A progress report was provided on the Model Bylaws for Hospital Medical Staffs, in particular, the inclusion of the development of an accountability mechanism to permit the medical staffs at hospitals to account to the public (through Med-Chi) for credentialing, peer review, quality assurance, and professional education.

Professional Review Organizations - The Executive Committee was provided with an update on the activities of the Delmarva Foundation and the Maryland Foundation for Health Care. Agreements have been made with the Maryland Foundation and the Prince George's Foundation for PRO review under the auspices of Delmarva. Also, Delmarva's PRO contract has been extended by HCFA to March 31, 1989, and it is anticipated the contract will be further extended for a three-year period ending March 31, 1992. It was reported that the Maryland Foundation's repayment fund balance as of November 30, 1988 was $11,000, and that the Foundation has obtained 29 additional nursing home contracts for Medicare Skilled review.

President's Regional Conferences - In an effort to enhance communications between Med Chi and the component societies, Dr. Dobridge, President of the Faculty, announced that two regional conferences had been scheduled. The first conference will be held with the Western Maryland counties on January 25, 1989, in Hagerstown, and a second conference has been scheduled with the Eastern Shore counties on February 22. Representatives invited to these regional meetings include the component society presidents, councilors, delegates, and alternate delegates to the Med Chi House of Delegates.

Communications - The Executive Committee endorsed a new communications system (developed by the Public Relations Committee and the Computers in Medicine Committee) designed to improve the flow of information between Med Chi, individual physicians, and component medical societies. A recommendation will be forwarded to the Council for approval of the system and its implementation.

LifeCard International, Inc. - Recent reports from physicians regarding a notice published by LifeCard indicating there would be a charge for processing of claims through LifeCard prompted Med Chi's inquiry into the matter. In response to our letter of December 13, 1988 to LifeCard, Thomas Durel, President of LifeCard, by communication of January 13, 1989, indicated that the fees were directed to high-volume institutions and billing agents who submit their Blue Shield claims electronically. Following a lengthy discussion, the Executive Committee directed that the issue be pursued for further clarification.

Council - January 28, 1989

Minutes - The minutes of the Council and Executive Committee were acted upon as follows:

Minutes approved: Council, Saturday, November 19, 1988

Minutes accepted: Executive Committee, November 17, 1988; Executive Committee, December 15, 1988

Proposed 1989 Budget - Dr. Jose Yosuico, Treasurer, presented the 1989 proposed budget; it was approved by Council. Council adopted a motion that the Executive Committee be provided with a monthly financial statement, which will be forwarded to Council. Dr. Antlitz stated that the Faculty should be commended for not requiring an increase in the Faculty dues since 1980, to which Council members responded with applause.

Petition to Reduce C-Section Rates - Dr. James Rivers, President, Maryland OB/GYN Society, who was invited to present the position of his specialty society, stated that the OB/GYN Society was strongly opposed to the draft petition filed with the HSCRC by the Public Health Research Group. The petition recommends that the HSCRC reduce the incidence of cesarean sections in Maryland hospitals by setting an annual target level of cesarean deliveries for community hospitals at 10 percent of all births and 17 percent for tertiary hospitals. Council discussed the issue at length, voted to support the position of the OB/GYN Society, and adopted a motion that properly trained physicians should continue to use their own judgment and expertise in the performance of c-sections.

Council Meeting Dates - Council adopted a motion to hold Council meetings on Thursdays at 4 p.m., rather than on Saturdays and, further, that a buffet dinner shall be made available at the meetings at no cost to the Council members. The following meeting dates were approved by the Council:

Thursday, March 23, 1989, 4 p.m.
Faculty Building
Wednesday, April 12, 8:30 a.m. and Friday, April 14, 1989
immediately following House of Delegates meeting,
Turf Valley Hotel and Country Club, Ellicott City, Md.
Thursday, June 29, 4 p.m.
Faculty Building
Thursday, September 14, 3 p.m.
Semiannual Meeting, Sheraton Fountainebleau,
Ocean City, Md.
Thursday, November 30, 4 p.m.
Faculty Building

Dues Waivers - Council approved dues waivers for the following physicians at the request of the component society indicated:

Baltimore City
Patricia McIntyre MD, Baltimore (disabled)
Charles County
Vernon B. Dettor MD, La Plata (illness)

Emeritus Members - The following physicians were approved for emeritus membership as requested by the component society indicated:

Anne Arundel County
Margaret Anderson MD, Pasadena
John Creamer MD, Pasadena
Baltimore City
William H.M. Finney MD, Baltimore
Margaret Paxson MD, Riderwood
A.N. Rahman MD, Timonium
William Rinn MD, Towson
Saul Zigel MD, Randallstown
Myra R. Zinke MD, Baltimore
Frederick County
Gordon Smith MD, Frederick
Harford County
Gunther Hirsch MD, Havre de Grace
Montgomery County
Seruch T. Kimble MD, Silver Spring
Prince George's County
Hugh G. Clark MD, Hyattsville
Rafael A. Delgardo MD, Kensington
H. Herbert Insel MD, Silver Spring
Francisco Venegas MD, Chevy Chase
Richard Whelton MD, University Park
Wicomico County
Charles Bagley MD, Salisbury
Robert D. Baker MD, Salisbury
C. Herschel King MD, Salisbury
Affiliate Members
Simon C. Beaudet MD, San Diego, CA
Alfred B. Dixon MD, Sunapee, NH
Erwin F. Fuerst MD, Sarasota, FL
Omer D. Sprecher Jr., MD, Hagerstown, MD

The names of these physicians will be forwarded to the House of Delegates for approval at its April 1989 meeting.

Emergency Medical Services - A letter from the Washington County Medical Society in which Med Chi was requested to address the matter concerning CRT/EMTs refusal to follow orders given by licensed physicians in attendance at a medical incident was reviewed. Following discussion, the Council approved, after amendment, a letter of response in which options of the Maryland Medical Protocols for CRT/EMTs were provided for the care and transportation of patients under emergency conditions.

Continuing Medical Education Policy - Dr. Gary Rosenberg, Chairman, Scientific Activity Committee, presented a proposed policy for Med Chi cosponsorship of continuing medical education, which was approved unanimously by the Council, as follows:

The Medical and Chirurgical Faculty of the State of Maryland, under the ACCME Guidelines for Cosponsorship of Continuing Medical Education Credit, is able to offer such credits to physicians of the State of Maryland.

The Committee on Scientific Activity meets monthly to consider cosponsorship requests. Requests must be submitted at least 60 days prior to the program and/or prior to having your solicitation brochure printed and/or mailed to your audience.

Where the Committee on Scientific Activity chooses to cosponsor a program involving a product or service, the Medical and Chirurgical Faculty reserves the right that a disclaimer be included in all promotional publicity for the meeting.

The Medical and Chirurgical Faculty requires that the following statements designating CME credit hours appear in the promotional literature:

> The Medical and Chirurgical Faculty is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.
> The Medical and Chirurgical Faculty designates this continuing medical education activity for _ Category I Credit Hours.

In order to meet the ACCME standards for organizations desiring cosponsorship by the Medical and Chirurgical Faculty for a single program, the organization must propose the concept to the Committee on Scientific Activity and then work jointly with the committee in designing the program. In addition, the organization will submit the following:

(1) Application fee of $150; $100 will be returned if approval is denied. Amendments to application will be charged $15.
(2) Date and location of presentation

(3) Draft of proposed program including goals and objectives, topics, speakers and schedule

The Council was informed that component societies would not be charged for co-sponsorship.

Medicaid Diversion

Medicaid Recipient Notice: Council reviewed Med Chi's response to the Department of Health and Mental Hygiene's letter requesting comments on a proposed plan to send a recipient notice to all Medical Assistance recipients notifying patients that Medicaid would pay hospital emergency rooms for treating emergencies only. It was the consensus of the Council that Secretary Wilzack should be advised that sending such a notice would be ineffective and that the public should first be educated to change their behavior in using emergency rooms indiscriminately. The Council adopted a motion that Med Chi be prepared to take such other steps necessary to appropriately deal with this issue.

Medicaid Diversion Update: Council was advised of an HSCRC hearing scheduled for February 1, 1989 for discussion of the experimental primary care access clinic rate for Medical Assistance patients. Following discussion, Council adopted a motion that Med Chi make known its objections to COMAR Regulations 10.09.02, regarding PCAC rates to include the physician component.

President's Regional Meetings - Dr. Dobridge reported on a January 25 meeting with the officers of the Western Maryland societies. He believes such meetings with physicians in their regional areas would enhance communications. Another regional meeting is scheduled with Eastern Shore physicians on February 22, 1989.

Communications - A joint proposal of the Public Relations Committee and the Computers in Medicine Committee to improve communications between physicains and component medical society offices was adopted by the Council. As part of the established Maryland Med Sig computer bulletin Board system currently operating in Maryland, the service will provide a means for Med Chi to respond immediately to any issue.

State Ethics Commission - A request by the Physician Quality Assurance Board (PQAB) for for an opinion of the State Ethics Commission concerning a possible conflict of interest in the appointments of Dr. Israel Weiner and Dr. Rose Mary H. Bonsack to the PQAB was discussed at length. Med Chi has requested that the PQAB provide us with a copy of their letter to the State Ethics Commission. The Council directed that Med Chi should pursue the issue if a response is not received from the Board.

Role Relationship Committee Report - Dr. Roland Smoot, Chairman of the Ad Hoc Committee on Role Relationship, presented the report of the committee and recommended adoption of the following:

(1) That Council adopt Alternative A of the report as the method by which specialties shall have representation in the Med Chi House of Delegates, and

(2) That the Role Relationship Committee, having completed its assigned tasks, be disbanded, effective upon acceptance of the report.

Following discussion, the Council adopted a motion to (a) support both of the above recommendations, and (b) that Alternative A be forwarded to the Bylaws Committee for inclusion in its report to the House of Delegates at the 1989 Annual Session. Alternative A reads:

> That the Bylaws be changed so as to allow for a standing committee consisting of representatives from specialty societies within Maryland (deleting the current Ad Hoc Interspecialty Committee). This committee would then be allowed to represent the various specialties by selecting seven members to be members of the Med Chi House of Delegates and, further, one member to be placed on the Med Chi Council with one vote. All such representatives to the House of Delegates must be members of Med Chi.
>
> The delegate would be allowed one full vote and, further, there would be an alternate delegate for each delegate position, the alternate delegate being without vote unless substituting for the delegate. Both the delegate and alternate delegate must be members of Med Chi.

Resolution on Tobacco Products - Council agreed to support the following resolution submitted by the Committee on Alcoholism and Chemical Dependency:

Resolution on Limiting the Sale of Tobacco Products in Maryland

> Whereas, Cigarette smoking is a major cause of death, disease, and high medical costs in the United States;
>
> Whereas, Nicotine is not only a drug but an addictive drug; and
>
> Whereas, Legal restrictions on the sale of tobacco may result in significant reduction of its use among the general population, thereby reducing the incidence of morbidity and mortality resulting from such use; therefore, be it
>
> RESOLVED, That the Medical and Chirurgical Faculty of Maryland supports efforts towards legislation limiting the sale of tobacco products in Maryland; and
>
> RESOLVED, That support for such legislation may include action aimed at raising the minimum age required for the purchase of tobacco products and restricting the means by which tobacco products may be dispensed.

Continuing Medical Education Review Committee *Site Surveys* - Dr. Eugene Libre, Chairman of the CMER Committee, was present for the discussion of the remuneration to the CMER Committee members for conducting site surveys at various facilities

throughout the state. The Council was advised that this issue had been discussed within the Executive Committee and the decision was made not to pay the members of the CMER committee for site surveys because many committees spend the same time and concerted efforts while serving on committees of Med Chi. Following a lengthy discussion, it was the consensus of Council not to authorize reimbursement to the CMER committee members for site surveys. After further discussion, however, Council adopted a motion to establish an ad hoc committee to study the issue.

Attendance at ACCME Meeting - Council authorized the attendance of Dr. Libre at the annual meeting of the ACCME in Chicago in March 1989 and directed that attendance at all future meetings must be submitted to Council for action.

AMA Alternate Delegate - The Chairman entertained a motion to fill the AMA Alternate Delegate position caused by Dr. John Hebb assuming the position of Delegate to the AMA, effective January 1, 1989. This motion was ruled to be apporpriate under the provisions of the Faculty Bylaws, Article IV, Section 9, which provides that the Council shall fill such positions until the next annual session of the House of Delegates. Dr. David Nagel and Dr. Marvin Schneider were nominated from the floor. Dr. Schneider withdrew his name from nomination because of time constraints. Dr. Nagel was elected by acclamation by Council to fill the vacancy until the House of Delegates election to be held at the 1989 annual meeting in April.

Dr. Hebb requested information relative to the appropriateness of this action, and legal counsel of the Faculty, Jean Bienemann, read the appropriate bylaw provision to the Council. Council Chairman responded to Dr. Hebb's inquiry, stating that the Council's action was appropriate and was in accordance with the filling of the vacancy for the AMA Alternate Delegate position by the Council until the next Annual Meeting. Hearing no appeal, the Council Chairman went on to other business.

Indigent Care - Dr. Albert Antlitz requested and received permission from the Council to pursue a concept currently used by the Kentucky Medical Association in providing free medical care for patients, particularly those considered below the poverty level.

Proposed Resolution on Margarine - Dr. Antlitz addressed a proposed resolution approved by the AMA Delegation to be presented to the AMA House at its annual meeting in June. The resolution was adopted by the Council and will be forwarded to the AMA for consideration at the its annual meeting in June, 1989.

Resolution on Margarine versus Butter

Whereas, Cardiovascular Disease is a leading cause of death in the United States;
Whereas, The 1988 Report of the National Cholesterol Education Program, National Heart, Lung and Blood Institute recommended margarine made from unsaturated vegetable oils to lower blood cholesterol;
Whereas, Unsaturated margarine is less atherogenic than butter;
Whereas, A National Retail Associaton commissioned Gallup Poll in 1988 determined that approximately 78% of table service restaurants have margarine available to patrons upon request;
Whereas, The same poll determined that approximately 92% of table service restaurants will, upon request, alter food preparation to use vegetable oil instead of saturated fat;
Whereas, Laws in certain states discourage the availability of margarine; and
Whereas, Many restaurants already appreciate the benefits of a health diet; be it therefore
RESOLVED, That the American Medical Association work with state medical societies, the restaurant industry and the media to make available unsaturated margarine in all restaurants.

OB Care of Patients - Dr. Lawrence Fink asked Council for support of a proposal to come before the Legislature initiated by Montgomery County directing the state to indemnify the provision of care for indigent OB patients. Following discussion, the Council voted to support such legislation.

PIP (Personal Injury Protection) - Dr. Joseph Fastow introduced a motion before Council that the Faculty (1) support the position that the PIP waiver be defeated in the legislature; (2) that the Faculty support the collateral source, and (3) that the Faculty derive informaiton on PIP so that that Med Chi will be prepared to take a position in the future. After discussion, motions (1) and (2) were withdrawn and Council voted to support motion (3).

Council: Special Meeting - February 16, 1989

Senate Bill 297 - Medical Laboratories - Permit Requirements -A special meeting of the Council was called to determine an appropriate policy decision on Senate Bill 297. Opening the discussion, the Chairman, Dr. Lee-Llacer read a letter from Dr. Leslie R. Miles, a member of Council representing Allegany County, in which he supported SB-297.

Following a lengthy discussion of the issue, Council adopted Dr. Dembo's motion that Med Chi support the bill with amendments, to seek further clarification of the meaning of the words "personally supervises" as used in SB-297, and to continue an ongoing relationship between Med Chi and the Department of Health and Mental Hygiene. After further discussion, Council adopted an amendment to the motion to require that any promulgation of regulations must go through the Administrative Executive Legisltive Review (AELR).

Executive Committee - February 16, 1989

Building Committee Report Dr. Nagel, on behalf of Dr. George Malouf, Chairman of the Building Committee, presented the committee's report that recom-

mended Med Chi should negotiate immediately with Mr. Nathan Landow, Chairman of the Maryland Democratic Party, who has expressed interest in renting the first floor of the Med Chi Annapolis building as the new home for the Maryland Democratic Party. The Executive Committee agreed with the recommendation of the Building Committee and suggested that negotiations be carried out by the Finance Committee and the Executive Director, and that a report be provided to the Executive Committee once the negotiations are completed. Later in the meeting, the Executive Committee voted to accept the report and refer the matter to the Executive Director to implement.

Medicaid Diversion Plan - Correspondence from Dr. Dan K. Morhaim, Chairman of the Department of Emergency Medicine at Franklin Square Hospital Center, and Med Chi's draft letter of response were reviewed by the Executive Committee. In his letter, Dr. Morhaim suggested that Med Chi become more proactive in managing complex health care and public policy problems, to which Med Chi responded with a detailed report of actions taken thus far in its efforts to resolve the Medicaid Diversion Plan and Mandated Assignment issues. The draft letter of response to Dr. Morhaim was approved as written.

Real Time Monitoring- Notification from Blue Cross/Blue Shield of Maryland that effective for dates of service on and after March 1, 1989, Blue Cross Blue Shield of Maryland will be provide benefits for ambulatory ECG monitoring, including Real-Time technology with full disclosure capabilities, in accordance with the ACC/AHA guidelines. Dr. Atkins mentioned that it was through Med Chi's efforts this was accomplished and such information should be conveyed to the membership through the *Maryland Medical Journal.*

Monthly Financial Report - The Executive Committee reviewed the monthly financial report and, after discussion, adopted a motion that Med Chi should investigate the possibility of a group purchase of FAX machines for use by members of the Executive Committee. It was also suggested that the component societies be polled to determine their interest in this venture. A report on this issue will be provided to the Executive Committee at its next meeting.

Physicians Quality Assurance Board - The Executive Committee approved a draft letter from the President of Med Chi to the State Board of Physician Quality Assurance requesting that all fee dispute complaints be sent to Med Chi for investigation in accordance with the legislative intent of Senate Bill 508. In addition, the letter requests that the Board seek, on Med Chi's behalf, an opinion from the AG's office as to Med Chi's immunity for investigating and mediating all fee disputes, not just those disputes that come under the disciplinary ground of gross and willful overcharging for professional services. An inquiry was made that if there is no immunity, how the current law could be amended to grant such immunity. However, the proposed amendment would not be to expand the existing disciplinary grounds. The letter also informs the Board that Med Chi has contacted the Antitrust Division for guidance in setting up a mechanism for conducting fee resolutions that would not be in violation of antitrust laws. ■

Elegant Entertaining

Begin or end a truly special evening in the elegant atmosphere of Med-Chi's historic Kraus Memorial Reading Room 1 block from the BSO. Available for catered functions every day. Please call Pat Marshall at 301-539-0872 for information.

For INSENSITIVE foot management we now offer:

★ EXTRA DEPTH
and the new "Thermolds" shoes

★ **Accomodative, impression molded inlays, for proper weight distribution, made of PLASTIZOTE or PELITE.**

★ **Custom MOLDED footwear as required.**

★ Outside fitting in home or hospital.
★ Also—Complete prescription service, including many special purpose shoes and shoes suitable for brace attachment.

Store Hours 9:00 to 5:00
except Thursday to 7:00 P.M.

Executive Director's Newsletter

June 1989

New Med Chi Resolutions

Resolutions on the following topics were passed by the Med Chi House of Delegates during the Annual Meeting in April: Student and Resident Participation, Natural Science Ambassador Project, Ophthalmic Surgical Care, and Women Physicians in Organized Medicine. To obtain a copy of the resolutions, contact Betsy Newman at the Faculty at 301-539-0872 or 1-800-492-1056 in Maryland.

Anti-Arrhythmic Drug Ban

The National Heart, Lung and Blood Institute recently announced that it has removed two anti-arrhythmic drugs, encainide and flecainide, from a clinical trial involving patients who had suffered heart attacks. Encainide is marketed by Bristol-Meyers under the trade name Encaid. Flecainide is marketed by Riker Laboratories under the trade name Tambocor. The action was based on recommendations from a Data and Safety Monitoring Board, which concluded that test-trial data show no benefit from the two drugs in the types of patients studied while suggesting a possible harmful effect in this clinical population. The FDA and manufacturers of encainide and flecainide are asking that the drugs not be used for arrhythmias that are not life threatening. FDA emphasized, however, that use of drugs should NOT be interrupted in life threatening situations.

Mutual Fire Inland and Marine Malpractice Insurance

The Faculty has sent an update on Mutual Fire's Plan of Rehabilitation to each policyholder who contacted its office. In general, we have advised the policyholders to contact the Policyholder Committee appointed by the Commonwealth of Pennsylvania for any additional information about Mutual Fire. Physicians may call 202-879-4000 to contact either Ms. Diane H. Lautrup or Richard A. Brown, Esq. with the Washington, DC law firm of Spigel & McDiarmid who have been retained by Mutual Fire to provide policyholders with information about the company. All physicians previously insured by Mutual Fire are reminded to register their name with Med Chi's legal services department so that any information regarding Mutal Fire's Rehabilitation may be directed to you.

Medical Mutual

The Medical Mutual Liability Insurance Society of Maryland recently announced it will not seek a rate increase in 1989 for its member physicians. In making the announcement, Raymond M. Yow MD, Chairman of the Board and Chief Executive Officer, said, "We are going into our third consecutive year with no rate

increase for our members. We are delighted that the cumulative effects of tort reform have allowed us to hold the line on rates."

ICD-9 Coding Requirements

The Health Care Financing Administration (HCFA) has directed Medicare carriers to delay enforcement of the new policy requiring all physicians to use ICD-9 codes on Medicare claims until June 1, 1989. This important policy change was spurred by the AMA's representational efforts on behalf of the profession.

To obtain a copy of the ICD-9-CM, third edition, Volumes 1 & 2 with shipment by priority mail and a guarantee for receipt of all addenda to be issued through 1991, send $43.00 (check or money order) to ICD-9-CM, Third Edition, Vols. 1 & 2, P.O. Box 360121, Pittsburgh, PA 15250-6121.

New HCFA Procedure

HCFA recently initiated a new procedure that requires Medicare carriers to provide state medical associations and specialty societies with all proposed changes in local medical policy and to invite their comments. The new procedure is part of the seven-point agreement HCFA entered into with AMA last January to correct the way carriers had gone about enforcing "medical necessity" provisions in 1988.

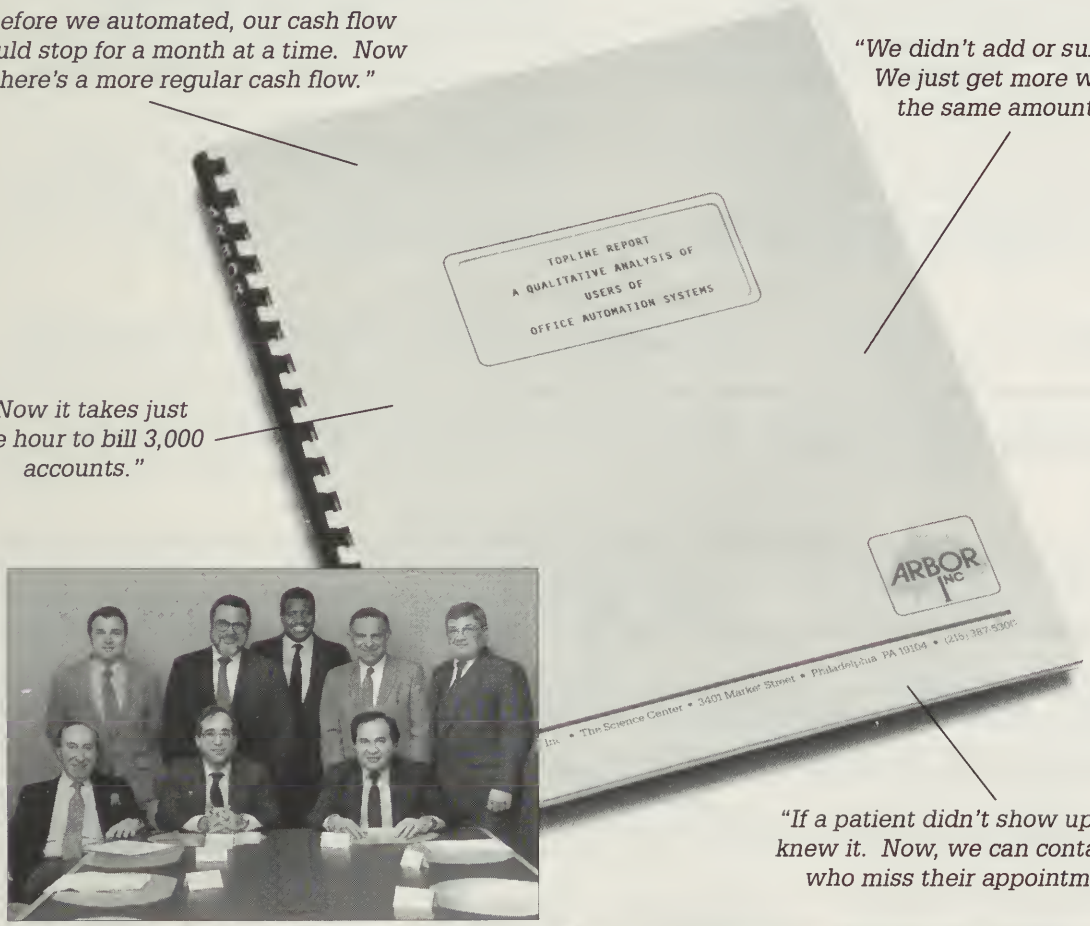
The AMA insisted that carriers be directed to invite comment from state medical associations and specialty societies on medical policy changes as one means of significantly improving the review process by making practices fair and equitable to physicians. The step should much to improve carrier-physician relations that have been at low ebb in recent years.

Med Sig Bulletin Board

Med Chi's Med Sig computer bulletin board provides announcements and updates on issues in medicine from the AMA, Med Chi and, around the state. All the information in this month's newsletter already appears on the Med Sig system. Any questions or requests for clarification of announcements in this newsletter may be entered directly into Med Sig. This enables Med Chi staff to respond to your requests almost immediately. The system is available to all member physicians throughout Maryland. For more information regarding the Maryland Med Sig Bulletin Board System, contact Betsy Newman at 301-539-0872 or 1-800-492-1056 in Maryland.

Medical Assistance

Med Chi is cooperating with the Medical Assistance Program of Maryland to develop methods to streamline claims processing and generally to improve the administration of the program. Physicians interested in becoming a Medical Assistance provider should contact Mr. Russell Jenkins, Director of Provider Enrollment at 301-225-5340.



Angelo J. Troisi, FACHE
Executive Director

Eight physicians and four medical office managers tell "all" about automation.

"Before we automated, our cash flow would stop for a month at a time. Now there's a more regular cash flow."

"We didn't add or subtract people. We just get more work done in the same amount of time."

"Now it takes just one hour to bill 3,000 accounts."

"If a patient didn't show up, I never knew it. Now, we can contact those who miss their appointments."

What can automation do for you?... What can't it do?... Is it practical?... What should you look for in a system?... What should you expect from the company who sells you the system?... How will it affect your staff?... And how do you go about getting the answers to all these questions?

KTI can help. As the systems supplier to over 3,000 healthcare professionals, we brought together a group of physicians and medical office managers to talk about the benefits and cautions of automation. And prepared a special report on their thoughts and comments.

If you want the advantage of their experiences, send us this coupon. And you'll get a lot of answers in just a few minutes of reading.

Send for your FREE report

MED PAY *Announces Insurance Processing Breakthrough*

"Physicians Receive Payment Today For Patients Seen Yesterday"

The **MED**ical **PAY**ment Services of Maryland, Inc. program has completely changed the way physicians receive their hard earned fees. **MED PAY** will convert existing receivables into immediate cash and reserves. The doctor then turns over all insurance claims and patient billings for processing by **MED PAY. MED PAY** does all of the rest. In turn, the doctor receives payment today for patients seen yesterday. It really is just that simple.

We know that this may sound too good to be true. So let us prove to you how this unique program can make a dramatic difference to the physician, their practice, and their patients. To set up an appointment for more information, call **828-5050.**

MED PAY is cost effective — especially for smaller practices of 1-5 physicians

MEDical **PAY**ment Services of Maryland, Inc. 1300 York Rd., Suite 150 • Lutherville, Md. 21093

MARYLAND GENERAL PROFESSIONAL CENTER

UPSCALE ENVIRONMENT. DOWNTOWN ACCESSIBILITY.

- Central location is easily accessed by major traffic arteries from every direction, is served by the subway station at the State Office Complex, and is located adjacent to the planned light rail system stop at Howard and Madison. Near Meyerhoff Symphony Hall, Lyric Opera House and Center Stage.
- Condominium arrangement offers office ownership benefits with low equity requirement.
- Conveniently located adjacent to Maryland General Hospital, within walking distance of hospitalized patients and specialized hospital services.
- Reduced travel time between hospital and office for both physicians and patients.
- Proximity to the hospital improves coordination of care among patient, physicians and hospital.

MGH

Maryland General Hospital
827 Linden Avenue
Baltimore, MD 21201

- Building is reserved solely for the practice of medicine and related services.
- Includes such features as a patient drop-off at the main entrance, 2 elevators (1 stretcher size), thermostatic controls for each suite, sound-conditioned walls, and handicap access.
- Ample parking available in the enclosed 317-space garage adjacent to the building.

For more information and a brochure, call Robert Haussmann, Vice President for Corporate Development, or Daniel Baldwin, Vice President for Planning at (301) 225-8390.

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and policies Governing the Practice of Medicine in Maryland.

■ ■ ■

The following is the Medicolegal Code of Cooperation adopted by the Faculty, the Maryland Bar Association, and the Baltimore City Bar Association for use by physicians and attorneys to guide them in their dealings with each other:

Medicolegal Code of Cooperation

Preamble

When a person requires a combination of medical and legal assistance, his or her physician and lawyer best serve that person by cooperating with each other. The members of the Maryland State Bar Association, the Medical and Chirurgical Faculty of the State of Maryland, the Bar Association of Baltimore City, adopt this declaration of principles as ethical standards of conduct for attorneys and physicians in such situations.

Attending Physician and the Attorney

Attending physicians and attorneys approach medicolegal problems from different points of view. The attending physician is primarily concerned with the patient's medical treatment. The patient's attorney is concerned with the most effective presentation of the patient's medical condition and problems, and the adverse attorney is required to thoroughly investigate the patient's contentions.

If a physician chooses not to continue treatment of a patient involved in a medicolegal situation, he should immediately notify the patient and allow the patient reasonable opportunity to obtain another physician.

In representation of a patient, an attorney may wish to obtain a second medical opinion regarding his client's condition. The attorney should not refer his client for examination or treatment to a second physician unless the attending physician is advised or the attending physician has voluntarily terminated his care and treatment of the patient. If an attorney refers a client for a second opinion, both the attending physician and the physician to whom the client has been referred should be notified.

Medical Records and Reports

Most medicolegal situations are resolved by an evaluation of medical records and reports. Documents submitted by an attorney in support of a client's claim must contain sufficient information to allow that client's medical condition to be evaluated. Sufficient information may be contained in a physician's medical records or a hospital record. In some cases, however, a special report by the physician may be requested.

Authorizations

An attorney should furnish the physician a proper Authorization for release of medical information regarding the patient unless not required to do so by law. (See HG 3-401.) When a treating or consulting physician receives a request for medical information accompanied by a proper Authorization, he should promptly furnish that information or the documents requested. If an attorney requests records or reports, he should specify whether a copy of the medical records maintained by the physician in treating the client will suffice or whether a special report is necessary. In the latter case, the attorney's request should specify the information needed in the report.

Fees

A physician may charge a reasonable fee for furnishing medical records or reports. If only existing medical records are requested, the charge should be for the reproduction and staff time incurred in that reproduction. If a special report must be prepared, the charge may include compensation for the physician's time expended as well as staff preparation time and reproduction. It is incumbent upon an attorney to see that the physician is promptly paid any reasonable bill submitted for furnishing medical records or reports.

Medical Testimony

Often in a medicolegal situation, the physician's testimony is necessary either at a deposition or trial. In either context it is particularly important that the attorney recognize the demands that patient care places upon a physician's time. Thus, notice and scheduling of the physician's appearance must be given the utmost consideration by the attorney. Physicians should understand, particularly in the context of a trial, that the date testimony is required is not always flexible, and accordingly, should arrange their schedule in an attempt to be present. Either depositions or videotape depositions offer an alternative to live court testimony. Attorneys should consider this alternative for the convenience of physicians whose schedules cannot accommodate appearances in court.

Prior to presenting testimony from a physician or producing a physician testimony at a deposition, an attorney may choose to meet with that physician and review the issues and questions which may be expected to arise. If the attorney makes such a request, the physician should cooperate by making himself available at a reasonable time to meet with the attorney prior to giving the testimony.

An attorney should consult with the physician or his staff prior to arranging depositions, and, if possible, prior to scheduling a trial date so that a date convenient to the physician may be selected. (Such a consultation may not be required where the physician is adversary to the attorney's client.) If it is not possible to consult with the physician or his office staff prior to scheduling a trial date, the physician should be immediately notified of the date upon which the trial has been scheduled.

A physician should cooperate with the attorney representing his patient regarding the scheduling of depositions or trial appearances. Should any changes occur in the physician's schedule which make it difficult for him to appear on a previously scheduled date, he should immediately notify the attorney of those changes. Similarly, the attorney should always keep the physician advised of changes in the time of or necessity for his appearance. A physician should be immediately notified if a trial is postponed or cancelled and his testimony is not necessary.

An attorney should not issue a Subpoena for a physician without advising him such Subpoena is to be issued and the date upon which the physician is requested to appear. (This requirement may not apply in situations where the physician is an adversary to the attorney's client.) During trials an attorney should attempt to work out an on-call arrangement with the physician so as to cause him as little inconvenience as possible in connection with his court appearance.

Physician Compensation

A physician is entitled to be compensated for time devoted to preparation for testimony and deposition. (This requirement may not apply in situations where the physician is an adversary to the attorney's client.) Compensation should be related only to time involved and never to the outcome of the controversy. If a situation occurs where a physician has cancelled appointments in anticipation of medical testimony and does not receive enough notice of a postponement or cancellation of the testimony to reschedule those appointments or otherwise use the time, he is entitled to reasonable compensation regardless.

The client-patient is initially responsible for compensating the physician for time devoted to the legal proceeding. It is appropriate, however, for a physician to either request compensation in advance of expending time or to arrange that the attorney, in addition to the client-patient, be personally responsible for the bill. If the latter arrangement is agreed upon, it should be reduced to writing.

The patient is responsible for bills for medical treatment and it is inappropriate for the attorney to agree to be personally responsible for those bills. However, the physician may request the attorney to secure the patient's agreement that outstanding medical bills be satisfied from any settlement, judgment; or insurance proceeds. If such an agreement is obtained, the attorney is personally responsible to see that it is carried out and is liable to the physician for failure to do so.

It is the duty of an attorney to see that a physician is promptly compensated for his time devoted to the proceeding. It is preferable for both the attorney and the physician to reach an agreement in advance concerning the amount of fees and expenses for time devoted to preparation or testimony. Neither the attorney nor the physician should enter into an agreement in which the physician's compensation is contingent upon the outcome of a case.

Medicolegal Committee

The Medical and Chirurgical Faculty of the State of Maryland and the Maryland State and City of Baltimore Bar Associations maintain a standing joint committee on interprofessional relationships. The committee is known as the Medicolegal Committee. Its purpose is to promote a closer and more harmonious relationship between the two professions. The committee membership is composed of twelve attorneys and twelve physicians.

The Committee will consider all matters concerning interprofessional relationships between the two professions, including, but not limited to, the following:

1. Promotion and perpetuation of harmony between the professions.
2. Achieving a fuller understanding of mutual problems.
3. Promotion of educational programs of interest to both professions.

4. Publication of guidelines regarding fees for record production, preparation for medical reports, and time spent in preparation for and the giving of depositions and trial testimony.
5. Consideration of disputes arising from interprofessional relationships including violations of the above Code.
6. Referral of legal or ethical violations, including violations of this code, to the Commission on Medical Discipline or the Attorney Grievance Commission in appropriate situations.

In dealing with problems which arise between individuals, physicians, and attorneys, the Committee will recommend a course of action based upon the principles in the Medicolegal Code. Matters already in litigation between an attorney and a physician will not be considered by the Committee.

General Provisions

Nothing contained in this statement of principles is intended to be inconsistent with provisions of law or rules of ethical conduct for attorneys or of a medical/legal claim against a physician. ■

OVER A CENTURY AGO,

a thousand visionary physicians across the nation bestowed a commemorative stone carving to the Washington Monument. This patriotic display symbolized their unrelenting devotion to a new republic founded on freedoms—including the freedom to practice medicine for the best possible health of all its people. *Today your help is needed to restore this symbol of our profession.*

Because the commemorative stone has suffered from severe erosion and defacement, the American Medical Association is launching a campaign to raise money from physicians to restore this symbol of medicine for the National Park Service. Every contribution made to this effort will serve as a statement of each physician's personal affirmation and commitment to health and medicine in America.

Please take part in rededicating the commemorative stone as a shining example of the strength of medicine in a free and strong society. Contributors who donate $100 or more will receive a memorial replica of the carving as a token of appreciation. Send your tax deductible contribution for this timeless symbol today. Thank you.

Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Photodynamic Therapy of Superficial Bladder Cancer

Approximately 35,000 cases of urinary bladder cancer are diagnosed in the United States each year, resulting in 10,000 to 12,000 deaths. In the Western Hemisphere 90 to 95 percent of the cancers are transitional cell carcinoma.

Cancer of the bladder is a heterogeneous disease. Epidemiologic studies have pointed to several environmental factors including occupation, diet, coffee drinking, cigarette smoking, certain medications, and chronic bladder infections. Bladder cancer is considered as an environmental model of carcinogenesis with multistage processes including initiating and promoting factors. A number of carcinogens, such as saccharin and nitrosamines, have been shown in rats to possess synergism in induction of bladder cancer. The most progress in understanding bladder cancer has been in the recognition of the role of carcinogens, initiators, and promoters in a complex setting producing a heterogenous cancer.[1,2]

The distinction of two major groups of transitional cell carcinoma (superficial and muscle invasive bladder cancer) helps in developing therapeutic strategy for a given patient. Superficial tumors are treated initially by transurethral resection and fulguration of the bases. However, the incidence of subsequent tumors ranges from 40 to 70 percent of cases due to multicentricity of these tumors. These subsequent recurrences have presented a major therapeutic challenge.

Photodynamic therapy (PDT) employing hematoporphyrin derivatives is an experimental modality under investigation for a number of cancers in several centers and is currently being evaluated in controlled multicenter studies as an ablative and prophylaxis modality in bladder carcinoma. Over the past several years, it has been demonstrated that these compounds are taken up and concentrated in malignant tissue and may be activated in penetrating light of 630 mm wavelength.

Complete treatment with photodynamic therapy will consist of a single injection of Photofrin.® Inject 2.0 mg/kg Photofrin® intravenously preceded by the laser therapy. Patients should be advised to minimize light exposure up for to 30 days. Seventy-two (72) hours after injection under appropriate anesthesia, the urologist will instill normal saline into the bladder.

As specific light delivery is critical to establishing the light dose, all laser fibers should be checked prior to the start of the procedure. Once the fibers are verified to be of good quality, the patient (under appropriate anesthesia) is placed in the lithotomy position and readied for PDT.

Full bladder treatment requires light delivery of about 17 Joules/cm2 using the spherical cavity diffuser.

This ongoing study at the University of Maryland Hospital is evaluating the role of photodynamic therapy in superficial bladder cancer. A phase II study has revealed the efficacy of this new modality of therapy.[3] A phase III study will determine the role of this therapeutic modality.

MRI UPDATE

Figure 1

Figure 2

Figure 3

CLINICAL INFORMATION: Non-meniscal abnormalities are commonly suspected and evaluated by MRI and unexpected non-meniscal abnormalities are commonly demonstrated in the course of MR evaluation for internal derangements of the knee.

FINDINGS: Figure 1 is a sagittal image through the lateral compartment of a 15-year-old patient's knee. The subarticular portion of the lateral femoral condyle is affected by low signal alteration containing three rounded areas of higher signal intensity. The findings here are diagnostic of osteochondritis dessicans (straight arrows). Notice the normal adjacent anterior and posterior horns of the lateral meniscus (curved arrows).

Figure 2 is a sagittal image through the intercondylar midportion of a 19-year-old patient's knee. The tibial insertion of the anterior cruciate ligament is indicated by the arrow. The remainder of the anterior cruciate ligament is totally disrupted and its expected position is occupied by inhomogeneous material of intermediate signal intensity compatible with hemorrhage. The anterior cruciate has been notoriously difficult to evaluate by MRI, but its reliable evaluation is now possible with careful positioning and rescanning of questionable cases.

Figure 3 is a coronal image of the posterior aspect of the knee of a 33-year-old patient. The arrow indicates a 1.5 cm. ganglion cyst intimately applied to the lateral aspect of the biceps femoris tendon just proximal to the fibular head. The MR study clearly demonstrates the extra-articular and extraosseous nature of this process.

COMMENT: MRI has become clearly established for evaluation of internal derangements of the knee. Meniscal evaluation is known to be highly accurate. The cases shown here are meant to demonstrate the efficacy and accuracy of MR evaluation of extrameniscal structures.

Sweeteners and Diabetes

Doctor, I check food labels for sugar, but what other names can it be listed under? What other sweetening agents are acceptable for the diabetic patient to use?

Sweeteners are classified into two general types: nutritive, commonly known as sugars (containing calories), and nonnutrative, chemical substances having a degree of sweetness to taste but do not metabolize into caloric production in the body. The nutritive sweeteners that may be listed on package labels by names other than glucose are corn syrup, dextrin, dextrose, invert sugar, lactose, maltose, molasses, raw sugar, turbino, sorbitol, fructose, brown sugar, honey, mannitol, and zylitol. All have a caloric equivalent when metabolized in the body and must be considered with the insulin dose being used in balancing the meal plan .

It is a misstatement to say that these preparations are proscribed for the diabetic patient. Carbohydrates or sugars are essential in all meal plans. When a diabetic patient states "I am not allowed any sugars in my meal plan," that person needs more dietary education.

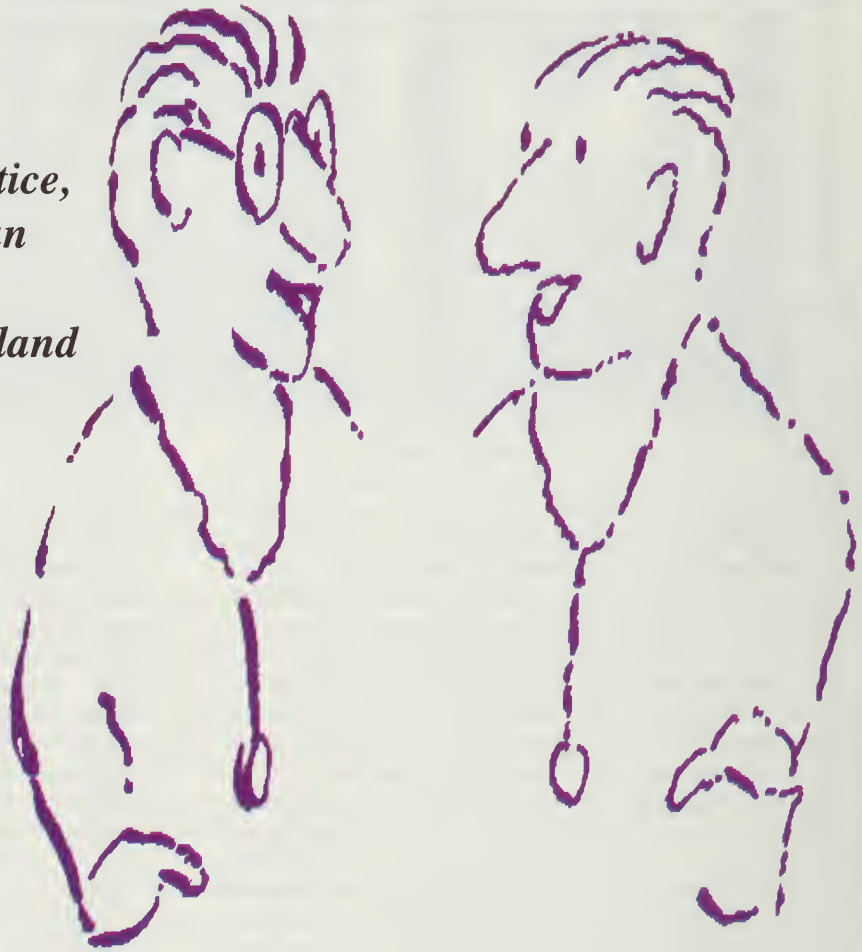
The two noncaloric sweeteners currently approved by the Food and Drug Administration are saccharin and aspartame. Saccharin was discovered in 1879 at Johns Hopkins University. It did not gain wide use as a noncaloric sweetener until after World War II, when it began to appear in soft drinks and food preparations to allow people to keep up their food and drink intake with a lessened caloric intake. The FDA considers noncaloric sweeteners worthwhile for psychological reasons and states that they should be used only by people who must restrict their intake of ordinary sweets.

There appears to be no question that saccharin is a weak carcinogenic substance in animals, but the level of human risk has led to confusion on the part of the public. The FDA tried to ban saccharin in the 1970s, and the 95th Congress prohibited the action by passing the Saccharin Study and Labeling Act (Public Law 95-203), which is still in effect.

Aspartame was approved by the FDA as a food additive in 1981. It is generally agreed that it is safe to be used as a noncaloric sweetener in foods and beverages. However, there are detractors of aspartame who would like the FDA to ban the substance. In a position statement in July 1987 the American Diabetes Association said, " Based on available evidence the Association finds the use of the two commercially available noncaloric sweeteners, saccharin and aspartame, to be acceptable....They should be used in amounts established as acceptable."

Noncaloric sweeteners as food and beverage additives are used extensively and excessively. Since they have no nutritive value their only usefulness can be to satisfy the psychological desire for sweets in the diets of people who must restrict their intake of carbohydrates.

The sweeteners are used more by the overweight population than by those with diabetes. A more healthful, practical, and economical approach for overweight persons would be instruction in the use of a weight-loss meal plan of normally available food plus increased exercise. Likewise, the diabetic patient could follow a well-planned diet without the use of noncaloric sweeteners with almost no hardship. These substances are here to stay and their use probably will be expanded. Are they being used excessively and improperly? Some examples of noncaloric sweeteners listed by brand name are:



Brand	Form	Table Sugar Equivalent
Adolph's™		
2 shakes	Granulated	1 teaspoon
Equal™		
1 packet (4 calories)	Granulated	2 teaspoons
1 tablet (0.4 calories)	Tablet	1 teaspoon

MEDICAL MALPRACTICE DAZE

In the topsy-turvy world of medical malpractice, it's the little things that can add up to very big dollars. That's why so many Maryland physicians have turned to William C. Garrett, a specialist in medical malpractice for over 20 years.

"George, did you hear about the malpractice insurance problems some Maryland physicians have had recently?"

"No Bob! What kind of problems?"

"Coverage problems mostly, or worse yet, lack of coverage."

"What happened, didn't they buy coverage?"

"Oh, they bought coverage alright, but the company went into receivership. Now there is some question about who pays for legal defense or for judgements rendered against them."

"Now I know who you are talking about. Didn't we have that company at one time?"

"We sure did, but our broker, William C. Garrett & Associates moved us out way before they got into trouble."

"Guess we were fortunate to have Bill as our broker."

"You can say that again George!"

"Was it a large malpractice suit?"

"No, as a matter of fact it involved premises liability. A patient fell after getting off the exam table."

"Why wasn't it covered, Bob?"

"It seems the broker had premises coverage on the office package only and not on the malpractice policy. Each company denied the claim saying it belonged to the other."

"Can that happen in our office, Bob?"

"No, it can't. Our broker, Bill Garrett, added premises to ***both*** policies we carry. That keeps us covered no matter what happens."

"It looks like Bill really knows his job."

One of the most difficult things encountered in the world of computers is wading through all the technical terminology used to describe computer hardware (the computer and monitor) and software (the programs installed on the computer that perform various functions). I have put together a group of the most used terms and their explanations.

Application Software The instructions that cause the hardware parts to work together to perform a specific function.

Backup A duplicate copy of a file or an entire diskette that is stored on a different diskette as a protective means against the accidental loss or destruction of the data. Crucial data and programs should be backed up.

Bad Sector A location on the diskette on which DOS is unable to record information. The CHKDSK DOS command displays the number of bad sectors on a diskette.

Batch File A collection of commands that can be run in one operation. A batch file is a file containing one or more DOS commands. All batch files must have an extension of .BAT. Enter only the file name to run the batch.

Boot The loading and running of a few program instructions that in turn load the remainder of the program. Booting the DOS operating system causes the loading of certain parts of DOS in memory and is done when starting the computer from power OFF. This is also called a COLD BOOT. You can also boot the DOS system with power ON. Restarting the system when the power is already on is called a system reset or WARM BOOT.

Byte A computer term representing a single character. It is the smallest unit of computer memory with which the hardware can work. The CHKDSK and FORMAT commands report the available and occupied space on a diskette in the number of bytes.

Chip An electrical component made of a wafer-thin slice of silicon housed in a ceramic or plastic casing with metal contacts. Chips are designed for a specific purpose: there are microprocessor chips, memory chips, math chips.

Console The keyboard and video screen of the personal computer. The console is a reserved device that DOS names CON. When specifying CON as a file spec in the COPY DOS command, you enter either CON or CON: .

Current Directory In a tree-structured directory system, DOS will search this directory if you enter a filename without indicating to DOS which directory the file is in. The CHDIR command is the DOS command to use to find out what the current directory is or to change the current directory.

Diskette The most commonly used type of disk storage for microcomputers consists of a round vinyl disk enclosed in a square plastic cover and generally stored in a diskette envelope.

Diskettes are not all the same, nor are they formatted all the same. Types include:

Single-sided - formatted for 160K or 180K
Double-sided - formatted for 320K or 360K
High-density - formatted for 1.2 M
(K=1024 bytes, M=1,048,576 bytes)

DOS Acronym for Disk Operating System. The program responsible for allowing you to interact with the many parts of a computer system. DOS is the interface between you and the hardware. DOS is responsible for keeping track of information stored on the disks, managing information moving between disk and the PC system, organizing information on disks, and other useful PC functions.

Edlin A program used to create, change(edit), and display lines of text. EDLIN stands for Line Editor.

Field A database term. A typical database containing names and addresses of company employees will contain a name field, an address field, a city field, for each employee's record.

File A collection of data or programs. A file is stored on a diskette and given a name so that you can recall it for use at a later time.

Fixed Disk A high speed Winchester-type disk on which thousands of files can be stored. A fixed disk can be divided up into separate areas called partitions. From one to four partitions are permitted on a fixed disk.

Format A DOS file management command that prepares blank disks for use. Use caution when formatting a non-blank disk: FORMAT C: will erase the entire hard disk.

Global Characters The two special characters * and ? that provide for greater flexibility with the DOS commands. Both characters can be used within the file name and/or file name extension. Global characters are also called wild cards. Global characters can be used in the following DOS commands: COPY, DIR, ERASE, and RENAME. Global characters should be used with caution, however, because used in the ERASE command they could cause multiple files to be erased with a single command.

Hidden Files These are the DOS system files IBMBIO.COM and IBMDOS.COM, which are hidden from the normal directory searches. This means these files are not displayed when the DOS DIR command is entered.

Integrated Software A type of software that combines two or more application programs into a single package. Integrated software allows data from one program function to be used in another and simplifies operations by using consistent commands and keystrokes throughout. A typical integrated software package might include word processing, database, and spreadsheet components.

LAN Local Area Network. A set of PCs that are linked together for the purpose of sharing peripherals

and or data. LANs are usually limited physically to a single office or building. Although the PCs share resources, each machine also can operate independently.

Microprocessor A chip that serves as the brain of the computer system. The microprocessor controls all computer operations.

Multi Tasking The ability of a computer to run more than one program at a time. Although a microprocessor can perform only one operation at a time, the high speed rotation between programs can make several processes appear simultaneous.

Path The unique route that leads DOS to the directory containing a specified file. The path consists of a series of directory names separated by backslashes (\). If a filename is included, it must also be separated from the last directory unless it begins with a backslash in which case, DOS starts its search from that directory.

Peripheral Devices The pieces of hardware that are connected or attached to the computer itself. Disk drives, printers, and terminals are peripheral devices.

Print Echo This function is performed by pressing the Print Screen key while holding the control key down (CTRL + PRTSCR). Once this key combination is pressed, whatever is shown on the screen is also printed on the printer. The simultaneous printing (screen and printer) continues until the key combination is pressed again. As an alternative Print Echo can be performed using the key combination CTRL + P.

RAM An abbreviation of Random Access Memory, also known as User Memory. This is the memory available to the user for use by the software. RAM is measured in bytes: typical amounts are 64K, 128K, 256K, 512K, and 640K bytes.

RGB Monitor A type of color monitor. The letters R, G, and B stand for Red, Green, and Blue.

ROM An abbreviation of Read Only Memory. This area of memory is used by the system, and cannot be written to by the user. Unlike RAM, ROM remains intact after the power is turned off.

Root Directory When a diskette is formatted, a single directory is created on the diskette. That directory is called the root directory, or system directory. In a nontree-structured directory system, a root directory can contain the names of files. In a tree-structured directory system, a root directory can contain the names of files as well as the names of other directories.

Subdirectory In a tree-structured directory system, all directories other than the root directory are called subdirectories. Subdirectories are actually files and are not restricted in size. Subdirectories can contain any number of files and other subdirectories, limited only by the available space on the disk.

System Reset A system function that restarts your computer just like a power on/off. This function is accomplished by pressing the DEL key while holding the control and ALT keys down. These keys are used to make sure you know what it is you are doing and to avoid a System Reset by accident. This is also known as a WARM BOOT.

Target Drive The drive that information is transferred or copied to. When two drives are involved in a

data transfer (COPY, DISKCOPY) one is known as the Source Drive and the other as the Target Drive. The Source Drive is the one that provides the data; the Target Drive receives it.

Telecommunications The transfer of data and information from one computer to another via the phone lines. A modem at each end changes the computer signals to phone signals and back again.

Toggle Key Any key that allows you to change state (on/off) each time it is pressed. Examples are the NUM LOCK key and CAPS LOCK key.

Tree Command The TREE (Display Directory) Command is a DOS disk management command that displays all the directory paths found on the specified drive. If the /F option is used, all the files in each sub-directory will also be displayed. For each directory found, the full path name will be displayed, along with the names of any directories defined within it.

Type Commands A DOS command that prints the contents of a text file on the screen. Performing a TYPE command on a non-text file will give you gibberish. If you do a Print Echo before the Type, the output will echo on the printer.

VER Command The VER (Version) Command is a DOS command that displays the DOS version you are using.

SPEAK OUT ON CONSULTATION

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer question about health issues. Med Chi currently airs two versions of Consultation:

Saturday Evening Consultation

- A Live Program
- Airs Saturday Evenings from 5-6 pm & 6-7 pm
- Broadcast across the country
- An Hour Long Program
- Call-In Format- Physician Answers Questions From Listeners

Sunday Morning Consultation

- A Pre-taped Program
- Airs Sunday Mornings at 7:30 am
- Broadcast on WBAL-AM radio
- A Half Hour Long Program
- Interview Format- A One-On-One Talk With John Stupak

Med Chi encourages all physicians to appear on this innovative program. To register fill in the form below.

Yes, I am interested in speaking on Consultation. Please contact me with scheduling information on the program.

Name_____ Address_____

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

HUNT VALLEY
FOR SALE

"XANADU"

- Stone and stucco Exterior maintenance-free
- 4½ acre fully landscaped Lot
- "Smart House" Automation by Unity
- Nanny/In-Law quarters
- 10,000 ± square feet
- Sauna
- Extensive Marble
- Five fireplaces
- 6 bedrooms, 6½ baths
- 3 whirlpools/spas
- In-ground pool by Maryland Pools
- "Observatory" on 3rd level
- 4-Car garage
- Glass block throughout
- Full security system
- Low-voltage Lighting
- Gourmet kitchen By SD Kitchens

OFFERED AT $1.2 MILLION

This new contemporary Mansion is nestled on a gorgeous 4.5 acre fully landscaped lot in prestigious Ivy Hill, only minutes from Hunt Valley Mall and I-83. This "Super Home" features a distinctive 3rd floor observatory for wine sipping stereo lovers, with a panoramic View out a barrel vaulted dome over beautiful Hunt Valley. 5 fireplaces of stone and marble add warmth throughout. Master bath and staircase feature semi-circular glass block. This house is a must-see for those who want only the finest components.

AXID®

nizatidine

Enhances compliance and convenience

Patients appreciate Axid, 300 mg, in the Convenience Pak

In a Convenience Pak survey (N = 100)[1]

- 100% said the directions on the Convenience Pak were clear and easy to understand
- 93% reported not missing any doses

Pharmacists save time – at no extra cost

- The Convenience Pak saves dispensing time and minimizes handling

The Convenience Pak promotes patient counseling

- Pharmacists dispensing the Axid Convenience Pak can encourage compliance and continued customer satisfaction

Convenience Pak is available at no extra cost

Additional information available to the profession on request.

AXID®

nizatidine capsules

Brief Summary

Consult the package literature for complete information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients at a reduced dosage of 150 mg h.s. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General* — 1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests — False-positive tests for urobilinogen with Multistix® may occur during therapy with nizatidine.

Drug Interactions — No interactions have been observed between Axid and theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility — A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy — Teratogenic Effects — Pregnancy Category C — Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers — Studies conducted in lactating women have shown that <0.1% of the administered oral dose of nizatidine is secreted in human milk in proportion to plasma concentrations. Caution should be exercised when administering nizatidine to a nursing mother.

Pediatric Use — Safety and effectiveness in children have not been established.

Use in Elderly Patients — Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among reported adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs < 0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic — Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients and was possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L) and, in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular — In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS — Rare cases of reversible mental confusion have been reported.

Endocrine — Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic — Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H_2-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental — Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity — As with other H_2-receptor antagonists, rare cases of anaphylaxis following administration of nizatidine have been reported. Because cross-sensitivity in this class of compounds has been observed, H_2-receptor antagonists should not be administered to individuals with a history of previous hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other — Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine administration have been reported.

Overdosage: Overdoses of Axid have been reported rarely. The following is provided to serve as a guide should such an overdose be encountered.

Signs and Symptoms — There is little clinical experience with overdosage of Axid in humans. Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous median lethal doses in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

Treatment — To obtain up-to-date information about the treatment of overdose, a good resource is your certified regional Poison Control Center. Telephone numbers of certified poison control centers are listed in the *Physicians' Desk Reference (PDR)*. In managing overdosage, consider the possibility of multiple drug overdoses, interaction among drugs, and unusual drug kinetics in your patient.

If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance.

ARMY RESERVE MEDICINE. BE ALL YOU CAN BE.

Nathan Smith and the Johns Hopkins Connection

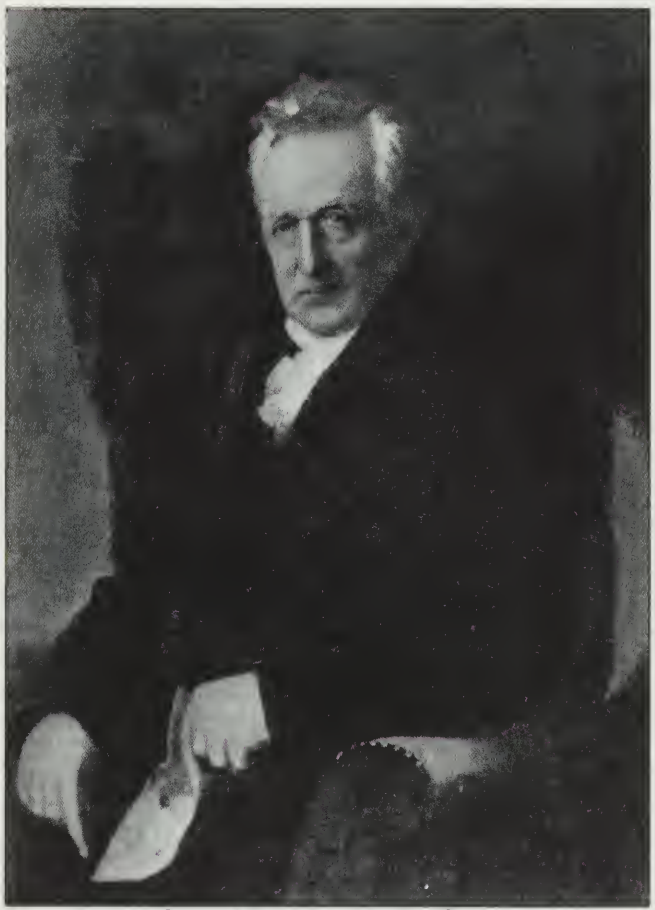
Ronald H. Fishbein MD

The lives of Nathan Smith and his descendants touched eight American medical schools: Dartmouth, Yale, Bowdoin, Vermont, Jefferson, Maryland, Transylvania, and Johns Hopkins.

The major events of the year-long commemoration of the Centennial of the Johns Hopkins Medical Institutions will take place June 7 - 11, 1989 in Baltimore with scientific symposia, the unveiling of a US postage stamp honoring Mr. Johns Hopkins, an art exhibit featuring medical masterpieces, gala concerts, and fireworks.

In recognition of this historic occasion, we present the following article describing Nathan Smith, his sons, and his grandson, Dr. Alan Penniman Smith, a little-known figure who came to play a pivotal role in the organization and building of the Johns Hopkins Hospital and Medical School. *Editor*

Dr. Fishbein is Associate Professor of Surgery at the Johns Hopkins Medical Institutions and is a general surgeon in private practice.



As we approach the centennial of The Johns Hopkins Hospital and the medical school of The Johns Hopkins University, it is appropriate to identify certain individuals whose participation in the establishment of the two institutions may have been eclipsed by the brilliant achievements of those who were to follow. In large measure, the early successes of Hopkins medicine were due to the assembly, from throughout the world, of an enormously talented faculty. However, much of the concept for the development of this unique hospital/medical school/ university complex originated in the city of Baltimore as the product of the efforts of a number of its visionary citizens.

One such person was Alan Penniman Smith MD. Born to a family renowned for its leadership in American medicine, Dr. Smith came to play a pivotal role in the organization and building of the hospital and medical school. There is anecdotal evidence that Alan Penniman Smith first generated the concept of such a medical facility. To appreciate the legacy of this man it is best to review his heritage, for it uncovers a portion of the history of American medicine and of medical education.

Prior to 1800, there existed in this country only four schools devoted to the training of physicians. The youngest of these, located in Hanover, New Hampshire, was associated with Dartmouth College. Its founder and sole faculty member was the ambitious and able Nathan Smith.

The story of this remarkable man's life and that of the generations succeeding him began in a small New England village and ultimately led to an important event in Baltimore 100 years later. A modest experiment in early medical education in the United States, shepherded by an unusual family, led to a bold new design for educating and training physicians.

Born in 1762, Nathan Smith spent his youth on a farm in a wilderness area of Vermont inhabited by Indians unreceptive to encroachment upon their lands.[1] Curiosity and the chance opportunity to assist an itinerant surgeon with an amputation led the young school teacher-farmer to become apprenticed to that surgeon. Demonstrating remarkably good judgment, Smith's mentor-to-be Dr. Josiah Goodhue of Putney, Vermont, insisted that young Smith prepare himself more soundly for medical studies by first fulfilling the requirements for admission to the Freshman class at Harvard College.[1,2] By 1787, his three years of apprenticeship with Goodhue completed, Smith entered practice in Cornish, New Hampshire. After serving the region for two years, the young physician recognized his need for further formalized education. This led to his enrollment in the new medical school associated with Harvard College and the acquisition of one of its first MB degrees in 1790.[3] He returned to Cornish, married, started a family, and soon became a respected practitioner traveling the countryside on horseback to attend his patients.

Nathan Smith MD, from a portrait by S.F.B. Morse.
Presented to the Yale Medical School by the Class of 1826.

After several years he was plagued by the notion that many other young men aspired to become physicians but lacked the proper opportunities. Only three medical schools existed in early post-Revolutionary United States, those associated with the University of Pennsylvania, Columbia College, and Harvard College.

Dartmouth

Boldly, Smith conceptualized a plan for the establishment of a Chair in the Theory and Practice of Medicine and presented it to President John Wheelock and the Board of Trustees of Dartmouth College in 1796. His proposal to Dartmouth was adopted, setting in motion his appointment as professor, the bestowal of a master's degree, and the assignment to deliver public lectures in Anatomy, Surgery, Chemistry, and the Theory and Practice of Physic. Thus was launched, in the Summer of 1798, a most ambitious educational experiment, the Medical School of Dartmouth. Its success was immediate; students came from great distances.

Married in 1791 to the young daughter of the heroic Revolutionary War General Jonathan Chase, Smith had soon become a widower. He subsequently married his wife's half sister, Sarah Hall Chase. Over the next 25 years, this fruitful union produced 10 children. The first two sons, David Solon Chase Hall and Nathan Ryno, were born prior to the start of the Dartmouth venture.

To honor his efforts as practitioner and scholar, in 1801 Dartmouth conferred upon Smith the MD degree. During the ensuing decade he gained enormous satisfaction from the constant procession of students through the institution as well as the growth of his family. In 1811 Harvard awarded Smith an MD degree, and the New Hampshire State Medical Society chose him as President. He vigorously pursued the enactment of laws to prevent quackery and to improve control over medical practice.[4] Simultaneously his clinical competence as a surgeon carried his name throughout New England.

However, deep political divisions in the state legislature prevented the medical school at Dartmouth from receiving the support necessary for its continued growth. Only after Smith's strenuous personal petition did the legislature, with great reluctance, supply necessary funds for building and equipment. After 15 otherwise successful years Dr. Smith's discouragement with these impediments led him to seek new challenges.

Yale

In 1812 the Corporation of Yale College, in concert with the medical society and the General Assembly of the state of Connecticut decided to establish a medical department at that school.[5] The fame of the 50-year-old Nathan Smith as an organizer and teacher as well as a practitioner of medicine and surgery led to an

invitation to come to New Haven. He did not break faith with those who had selected him to launch the new medical school at Yale. Along with colleagues Munson, Ives, Silliman, and Knight, Smith soon made the school a success. Personal fulfillment also flowed from witnessing the medical education of his eldest sons, Solon and Ryno, at Yale.

Bowdoin

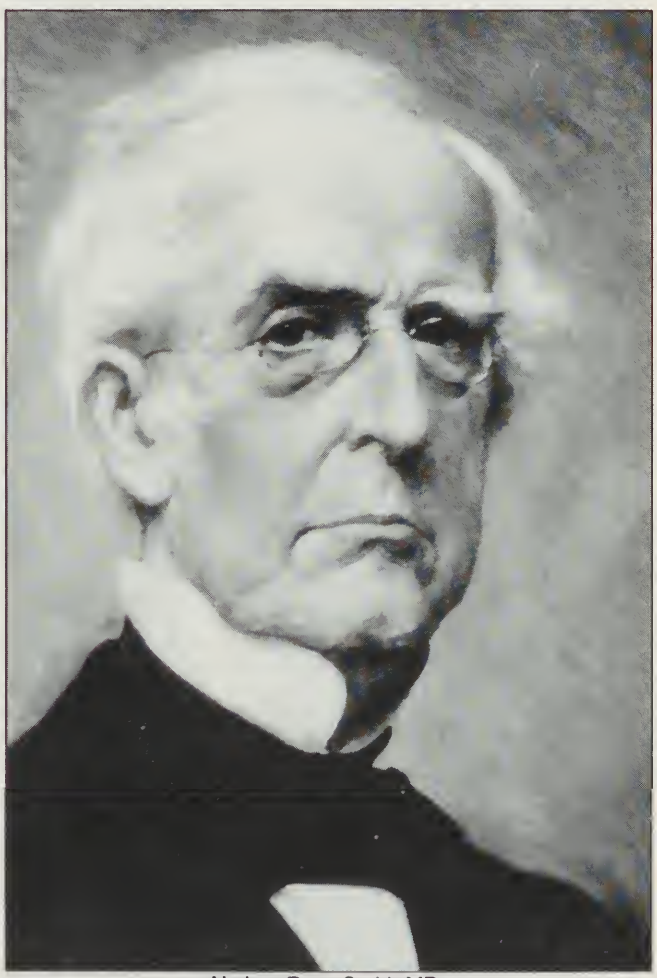
In 1820 Smith was summoned to the new state of Maine when the legislature established and endowed the Medical School of Bowdoin College at Brunswick. In the spring of 1821 he arrived in Maine to commence his lectures and clinics and to perform numerous surgical operations. This he did without relinquishing his position at Yale where he continued his activities during a different portion of the year.

The eldest sons had graduated from medical school, and it appeared that Nathan Ryno was destined to follow most closely his father's career. In addition to all the scientific and leadership qualities of the senior Smith, it became evident that Ryno would also possess a literary and scholarly talent. After receiving his undergraduate degree from Yale in 1817, Ryno was employed as a classical tutor to the family of Mr. Thomas Turner of Fauquier County, Virginia. In a little over a year he developed a life-long devotion to the South. However, he returned to New Haven to study medicine, receiving an MD degree in 1823.[6]

University of Vermont

Within months of the creation of the medical school at Bowdoin, the University of Vermont founded a medical school in Burlington. It was only natural that the assistance of New England's most experienced designer of such institutions be sought. Nathan Smith obliged. It was convenient that Ryno was available and could help his father in this venture. Within a year Ryno received an appointment as Professor of Anatomy and Physiology. The senior Smith became a special lecturer in Surgery and consultant on the organization of the faculty. For three consecutive years, until the fall of 1824, Nathan Smith divided his time between academic responsibilities among the schools in Connecticut, Maine, and Vermont. Death came to him in 1829.

Events moved quickly for Ryno after his appointment at the University of Vermont. He depended on and received the advice of his father with respect to academic and organizational matters. In the style of his father-mentor, Ryno took leave to attend the University of Pennsylvania under the tutelage of Philip Syng Physick. This was to prepare himself more completely for scholarly pursuits.



Jefferson Medical School

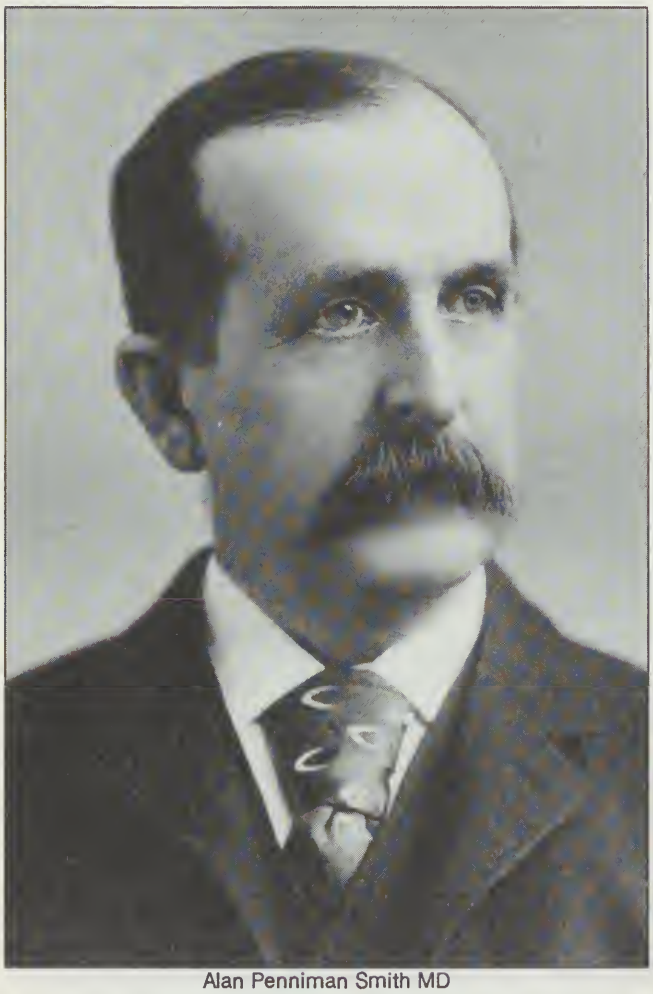
Whatever his intentions may have been with respect to a career in New England, his meeting in Philadelphia with a former college acquaintance, Dr. George McClellan, profoundly shaped his future. So impressed was Ryno with Dr. McClellan's clinical and pedagogical skills that he unhesitatingly accepted the latter's invitation to participate in the inauguration of the Jefferson Medical School in 1825. Resigning his post in Vermont (where only recently he had been granted the chair in Anatomy and Surgery), Ryno left for Philadelphia to join the faculty of that city's second medical school.

After only two sessions in Philadelphia where he served as Chairman of Anatomy and became a founder of the *Philadelphia Monthly Journal of Medicine and Surgery* and associate editor of the *Medical Review*, he again prepared to change venue.

University of Maryland

Before his roots could be established in Philadelphia, he was beckoned to the University of Maryland in 1827. Founded nearly a quarter century earlier, the Baltimore school was the fifth such institution in the nation and was well established by the time of Nathan Ryno Smith's appointment. Though invited as chair-

Nathan Ryno Smith MD,
known as "the emporer." Oil painting is hung at Med Chi in the Executive Director's Office.



man of anatomy, he arrived in 1827 to find he had been granted the chair in surgery recently abandoned by the precipitous departure of Granville Sharp Pattison.[7] Thus began, on an inauspicious note, a long and glorious, although not uninterrupted, relationship between Ryno and the first institution in the South to come under the influence of the Smith family.

Although the reasons for his apparently sudden relocations are veiled in uncertainty, there can be no doubt concerning the positive impact he made during his 50-year-tenure in Maryland.

For one brief period between 1838 and 1840, because of serious administrative turmoil at the University of Maryland, Ryno resigned from his position and accepted, without moving his home from Baltimore, the chair in surgery at the University of Transylvania in Lexington, Kentucky. When peace was restored to the Maryland school, Ryno resumed his activities on reappointment.

The second phase of Ryno's career at the University of Maryland was entered with great enthusiasm, buoyed by his growing international reputation as well as by the support of the Baltimore community.

As with his father, his career reached its zenith near the age of 50. In the annals of Maryland medicine he was recognized as one of the greatest surgeons America has produced.[8]

Alan Penniman Smith MD

Alan's great-grandaughter.

The joy of witnessing his four sons graduating successively into medical careers turned to tragedy in the early deaths of three. Left to continue a family tradition was Alan Penniman Smith. This third son, born in 1840 (the year his father returned to the faculty at the University of Maryland) entered Princeton at age 16, but the untimely death of one of his siblings, that very year, led to the decision to bring Alan home. He continued his studies at the school known as St. Timothy's Hall in Catonsville. In the fall of 1858, under the scrutiny of his father, Alan began the study of medicine, completing the entire curriculum by 1861.

An anecdote revealed in later years speaks to the confidence in each other and in themselves that was a hallmark of this family. In all likelihood, Alan's first experience being thrust into the position of assistant to his illustrious surgeon-father came when he was a medical student in 1860. Called by his mother to the bedside of one of his sisters who had been seized with pain, he recognized the gravity of the situation and summoned his father. After a rapid appraisal of his daughter's condition, Nathan Ryno pressed his son to assist him and his wife to provide illumination, while he operated on the stricken girl for strangulated hernia. Without benefit of anaesthesia the patient maintained her composure, warning her mother to be careful not to allow the candles to burn the hair of the surgeons bent over her. She was rewarded with complete recovery.[9]

Civil War hostilities had begun by the time Alan Penniman Smith received his medical degree. Passions erupted early in the border state of Maryland where the foe often could be found in one's own family.

While the great battles of the Civil War were taking their toll, Alan remained with his father, developing not only surgical skills but also the astute clinical judgment he apparently inherited from both father and grandfather. In 1862 he married Emily Anna Jones, daughter of the late Andrew Dickson Jones, Esq. and Mary J. Jones.

July 10, 1863 signalled the devastation known as the Battle of Gettysburg. Word arrived in Baltimore of the need for surgical supplies. Alan and several colleagues proceeded to the battlefield to aid in the care of the wounded. Not long afterward the Smith family was notified that on that day their youngest son expired, falling victim to typhoid fever contracted in the Confederate Army Hospital in which he served. The bond between Alan and his father was further strengthened by this event.

Baltimore in the postbellum period was a city undergoing remarkable social and economic growth. Despite the rapid expansion of commerce and industry, vast pockets of poverty and unemployment existed. Sanitation was primitive, and sickness and industrial injuries reached significant magnitude. With a sense of mission young Dr. Alan Smith entered this setting.

Aware of the health needs of a large indigent population and out of medical school scarcely five years, Alan approached his friend and neighbor, the enormously wealthy merchant and industrialist Johns Hopkins, with the hope of obtaining a contribution toward the establishment of a free dispensary. Mr. Hopkins appeared to be interested in the young physician's proposals, but after several meetings in 1865-1866 no commitment was forthcoming. Just when Alan began to assume the fruitlessness of his efforts, Hopkins called for him and unfolded before him a grand plan for establishing a free dispensary as part of a vast hospital equipped for the care of the sick, both rich and poor. An equal sum was to be bequeathed to establish a University, based on the grounds of the 400-hundred acre family estate, Clifton. By age 25, Alan Penniman Smith had begun to travel the very same road his father and grandfather had journeyed.

With the revelation of his plans, Johns Hopkins invited Alan to be a trustee of the proposed hospital. He was the youngest, as well as the only physician, member of the board. In August 1867, Mr. Hopkins again honored Alan by naming him, along with eleven others, an incorporator of the Johns Hopkins University.[9,10]

By this time Ryno was 70 years old, and although actively practicing and continuing to hold the Chair of Surgery, he began to rely more heavily on his only surviving son, Alan, to care for their mutual patients. At a major public reception in Baltimore, fellow citizens and professionals expressed their admiration for the man who, until then, had occupied the Chair in Surgery for 40 years. In his response to this outpouring of adulation he was quoted on September 20, 1867 as having said

> A distinguished and wealthy citizen of our own community, I am happy to say, contemplates the early foundation of an institution which will cause his name to be ever revered by suffering humanity.[11]

This, most likely, was the first public announcement of the plans of Johns Hopkins, inspired by Alan Penniman Smith. The year 1870 was marked by the elder Smith's appointment as Emeritus Professor as well as his election for a two-year term as President of the Medical and Chirurgical Faculty of Maryland.

Alan began to develop an active general as well as surgical practice. Like both his father and grandfather he demonstrated enviable skill as a lithotomist, employing to perfection the instrument devised for this purpose by Nathan Ryno.[8] In 1878 he published a critically acclaimed report of his first 52 consecutive operations for bladder stone without a single loss of life.[12] He became a member of the staff of nearly every hospital in Baltimore.

In 1868 Alan Penniman Smith was elected adjunct Professor of Surgery at the University of Maryland and in 1875 became Professor of Operative Surgery, a position he held for only two years, voluntarily relinquishing it due to the pressure of an enormous private practice and a stated distaste for writing and for preparing lectures. He did enjoy the opportunity to teach at the bedside, in clinics, and in the operating room and was personally responsible for the training, by preceptorship, of a number of surgeons.

On March 10, 1873, Mr. Hopkins transmitted to the trustees of the hospital what is now considered to have been a landmark communication signaling his clear intentions regarding the institution and thereby initiating the birth of the Johns Hopkins Hospital. Alan Penniman Smith began to devote the remainder of his life to the project on which his name and those of future members of his family would become indelibly impressed. The great benefactor, Mr. Johns Hopkins died December 24, 1873, at age 78.

After receiving the Hopkins bequest in 1875, the Trustees of the Johns Hopkins University rapidly proceeded to obtain a temporary site for the institution as well as to invite Daniel Coit Gilman to accept the presidency. By the fall of 1876, Dr. Gilman was inaugurated, an outstanding faculty had been assembled from around the world, and classes had begun.[13] In sharp contrast, progress by the Johns Hopkins Hospital Board was methodical but agonizingly slow. Four years after solicitation of architectural plans and final adoption of the remarkably innovative design by John Shaw Billings, excavation was begun in June 1877.[14]

As a member of the building committee and the only physician on the hospital board, Alan was particularly aware of his responsibilities and devoted a great deal of time to overseeing construction. While time dragged and completion of the hospital seemed remote, a schism developed between board members who preferred to delay opening the institution until construction was completed and the entire professional staff was assembled and a group that lobbied for early initiation of services. Pragmatic Alan aligned himself with the unsuccessful minority who reluctantly consented to defer operations until construction was complete. Ironically, though the hospital did not formally open to receive patients until the Spring of 1889, it was Alan Penniman Smith who treated the first recorded patient at the Johns Hopkins Hospital, ten years earlier. According to the minutes of the Board of Trustees of the hospital, on July 15, 1879 the foreman of the bricklayers, working on the kitchen building fell to the cellar, a distance of about thirty feet

> braking his right leg below the knee and otherwise injuring himself. He was removed to the basement of the Octagon Ward and Dr. Alan P. Smith was sent for who dressed the fractured limb. A room was afterward fitted up and furnished in the basement of the Male Pay Ward (now called Lower C) and the patient removed thereto. He fully recovered from this hurt, dying several years after from other causes.

Dr. Henry R. Hurd, the first Superintendent of the hospital and personal friend of the Smith family, in a paper read before the Book and Journal Club of the Medical and Chirurgical Faculty, declared that Alan P.

Smith was offered the position of surgeon-in-chief of the Johns Hopkins Hospital, but declined it.[15] Nowhere else is this claim corroborated.

Elected to fill a vacancy on the Board of Trustees of the Johns Hopkins University in 1881, Alan again held an unsuccessful minority position by emphatically supporting what he knew to be the strong personal desire of the founder for the university to be located on the grounds at Clifton. The majority view prevailed, and the campus was relocated from its temporary quarters in the city to a beautiful site known as Homewood.

Alan's eldest son, Nathan Ryno Smith, Jr. attended the new Johns Hopkins University soon after its opening and then received his medical degree from the University of Maryland, eventually enjoying the appointment as an assistant physician in the dispensary of the Johns Hopkins Hospital. He became the fourth generation of Smith physicians.

In Spring 1890, Alan's second son, Walter Prescott Smith received his medical degree from the University of Maryland, served as an intern at the Lombard Street Infirmary, and then returned to work in the office of his father and brother where he devoted himself to the treatment of throat and chest diseases. He distinguished himself as a founder of the Hospital for Consumptives later known as Eudowood.

The final years of Alan Penniman Smith's life were plagued by ill health that nearly incapacitated him. By the time he died (at age 58 in 1898) he had the satisfaction of witnessing not only the opening of the Johns Hopkins Hospital and University but also, finally, the inauguration of the long-awaited medical school in 1893.

Alan's eldest sister, Frances, married Dr. Elisha Warfield Theobald and had a son, Samuel Theobald (1846-1930), who received his medical degree from the University of Maryland in 1867. He studied Ophthalmology and Otology in Vienna and London, then returned to Baltimore. A proflific author of scientific articles and a founder of the Baltimore Eye, Ear and Throat Charity Hospital, he joined the staff of the Johns Hopkins Hospital at its opening in 1889. In the absence of an organized department, Samuel Theobald was obliged to limit his activities to practicing and teaching in the dispensary.[16] In 1906 he published a major textbook, *Prevalent Diseases of the Eye,*[17] in which he was identified as Clinical Professor of Ophthalmology and Otology in the Johns Hopkins University.

Samuel Theobald's sister Ruth married George von S. Longcope. Their son, Warfield Theobald Longcope (1877-1953) received his undergraduate and medical education at Johns Hopkins.[18] A student of Osler, Welch, Kelly, and Halsted as well as Howell and Mall, he soon discovered the delights of medical investigation. First as a pathologist then as a clinician (reminiscent of the interests of his great grandfather, Nathan Smith), he delved into studies in microbiology and the specific etiology of a variety of diseases.

Working at the Philadelphia Hospital with Simon Flexner, Longcope was appointed as an assistant professor of applied clinical medicine at the University of Pennsylvania. In 1911 he became Professor of Medicine at Columbia University and director of the medical service at the Presbyterian Hospital. In 1922 he was the fifth appointee to the chair in medicine at Johns Hopkins. His seminal work on diseases and injuries of the kidney as well as investigations and description of sarcoidosis remain benchmarks for all subsequent medical inquiry.[19]

It may never be possible to establish the moment in time nor the factor or person responsible for prompting Johns Hopkins to establish a medical institution. He left little personal correspondence, hence his biographers have suffered from a lack of insight into his noncommercial interests. He seems to have been a very private man who, without children to record or to embellish upon his philosophy, left to speculation his philanthropic motives.

He was a member of the Society of Friends and, as a practicing Quaker, was committed to a belief in the dignity of man and to the care and protection of those in need. He was a member of the Board of Visitors to the Maryland Hospital for the Insane at Baltimore, where the Johns Hopkins Hospital was built after the former institution moved its facilities to the country.

It has been written that the world-class philanthropist George Peabody persuaded Mr. Hopkins that it was more pleasant to give money away than it was to make it.[20] Hopkins, only months before his demise, had occasion to tell Alan Smith that he regarded himself merely as the watchdog guarding the treasure.[9]

In 1865 no individual could have been indifferent to the privations caused by the Civil War. Baltimore was the crossroads between the Union and the Confederacy, and the ill and injured moved through the city in both directions. Undoubtedly these factors helped kindle Mr. Hopkins' sensibility and prepared him for the contribution he was to make. It is tempting to assign credit to Alan Penniman Smith (family friend, neighbor, and eventually personal physician to the benefactor) for implanting the original idea for the medical institution.

Thus, eight American medical schools (Dartmouth, Yale, Bowdoin, Vermont, Jefferson, Maryland, Transylvania, and Johns Hopkins) have been touched by the lives of Nathan Smith and his descendants. Their impact on two centuries of American medical education as organizers, teachers, practitioners, and scientific investigators can scarcely be estimated. As the greatness of Nathan Smith was honored on the hundredth anniversary of the founding of the Yale Medical School, the contribution of subsequent generations of his family will be remembered upon the occasion of the centenary of the Johns Hopkins Medical Institutions in 1989.

ARMY RESERVE OFFERS NEW FINANCIAL INCENTIVES FOR RESIDENTS IN ANESTHESIOLOGY AND SURGICAL SPECIALTIES

If you are a resident in Anesthesiology, Orthopaedic Surgery, or General Surgery including Neurosurgery, Colon/Rectal, Cardiac/Thoracic, Pediatric, Peripheral/Vascular and Plastic Surgery, the Army Reserve has a new and exciting opportunity for you. The New Specialized Training Assistance Program will provide you with financial incentives while you're training in one of these specialties.

Here's how the program can work for you. If you qualify, you may be selected to participate in the Specialized Training Assistance Program. You'll serve in a local Army Reserve medical unit with flexible scheduling so it won't interfere with your residency training, and in addition to your regular monthly Reserve pay, you'll receive a stipend of $678 a month.

You'll also have the opportunity to practice your specialty for two weeks a year at one of the Army's prestigious Medical Centers.

Find out more about the Army Reserve's new Specialized Training Assistance Program. Call (collect) your U.S. Army Medical Department Reserve Personnel Counselor:

American City Bldg., Suite 307
10227 Wincopin Circle

ARMY MEDICINE. BE ALL YOU CAN BE.

What Physicians Should Know about Small Area Variation Analysis

Vahé A. Kazandjian MPH, Peter E. Dans MD, and Leonard Scherlis MD

Kazandjian, a PhD candidate, is Director of Research at the Maryland Hospital Association and Adjunct Instructor of Preventive Medicine and Epidemiology, The University of Maryland School of Medicine. Dr. Dans is Director of the Office of Medical Practice Evaluation; Associate Professor of Medicine, Johns Hopkins University School of Medicine; Chairman of the Committee on Small Area Practice Variations for the Medical and Chirurgical Faculty of the State of Maryland. Dr. Scherlis is Professor, Department of Epidemiology and Preventive Medicine, University of Maryland School of Medicine.

Geographic variations in the use of medical care may occur because of differences in patient severity of illness, patient access or use of medical care, physician practice patterns, availability of technology, economic incentives, and malpractice concerns. These variations are leading to greater scrutiny of appropriateness and cost effectiveness of medical care.

Wide variation in health care utilization has always existed. As early as 1856, Dr. William A. Guy, a physician at Kings College Hospital in London, reported that inhabitants of the parish of St. Mary-le-Strand were hospitalized 325 times more frequently than those of the district of Marylebone.[1] In explaining the disparity, he characterized Marylebone residents as an increasing class of working men, in receipt of good wages, who are in the habit of applying to hospitals as a matter of course, even for trifling attacks of illness, to say nothing of those which sometimes follow immediately on expensive acts of self-indulgence. It is hard to believe that these words were written over 125 years ago.

The presence of such variations in health services utilization between countries of wide economic disparity (for example, the United States and India), and even between geographic areas in the United States has been repeatedly confirmed. A recent study by Howell and McLaughlin demonstrated that widespread variations in health care utilization were documented as early as 1917 in the United States.[2] Although some of the variations could be related to geographic differences in household income, population size, and availability of health care resources, significant regional variation remained unexplained. The disparity in care as well as in available facilities in urban and rural areas was vividly presented in congressional testimony in the 1930s and 1940s.[3] This led to the enactment in 1947 of the Hill-Burton Act, a federally subsidized hospital building program.[4]

Medicare and Medicaid were enacted in 1965 to eliminate variations related to problems with access (mainly to acute care facilities) by the elderly and the poor.[5] In providing for these programs, little attention was paid to the role of the patient and of the physician in inducing demand. The assumption was that these programs would merely assure that disadvantaged groups would now receive care equal to that of those who could finance it.

However, the addition of Medicare and Medicaid to the already increased availability of employer-guaranteed health insurance (first introduced in 1930) clearly helped fuel a marked increase in the delivery of patient care. A major contributing factor was the explosion in diagnostic and therapeutic technology, which enabled physicians to do more for patients. Health care programs were expanded in scope to care for more patients with chronic and disabling conditions in addition to the acute conditions for which health insurance was designed.

In 1973, the report of Wennberg and Gittlesohn on health care utilization rate variations for tonsillectomy and adenoidectomy between counties and neighboring towns in Vermont, Iowa, and Maine[6] again focused attention on the issue of small area variation. Their study suggested that some of the difference in utilization was due to physician preference and to outdated medical practices. Recent studies by the Rand Corporation of coronary bypass surgery, coronary angiography, carotid artery surgery, and endoscopy[7,8] confirmed the widespread existence of such variations.[9]

Variations in utilization rates have also been demonstrated in Maryland. We illustrate some examples of these variations for carotid endarterectomy (range: 0.8 - 7.9 per 10,000 population), laminectomy (range: 3.2 - 17.8 per 10,000 population), cesarean section (range: 17 - 37 per 100 deliveries), and prostatectomy (range: 199 - 424 per 10,000 males 65 years and older) (see Figures 1,2,3,4).

Because of the importance of these variations, a Committee on Small Area Variation was formed in 1986 by the Medical and Chirurgical Faculty of Maryland as a successor to the Committee on Cost-Effective Medical Care. This committee is charged with working with the Maryland Hospital Association, the Maryland Department of Health and Mental Hygiene, and others to explain hospital utilization variations in Maryland.

In the late 1970s and early 1980s, these variations were discovered by health care policymakers interested in cost containment. Early discussions of these variations often proceeded along these lines: (1) the higher utilization rates were inappropriate, (2) the physician was the primary person responsible for the increased

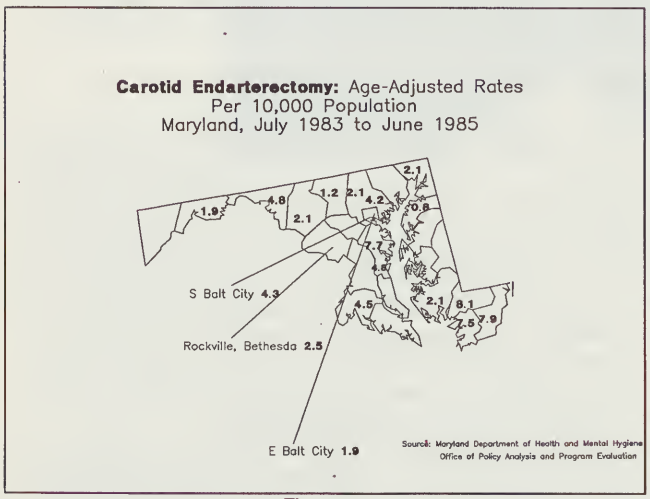

Figure 1.

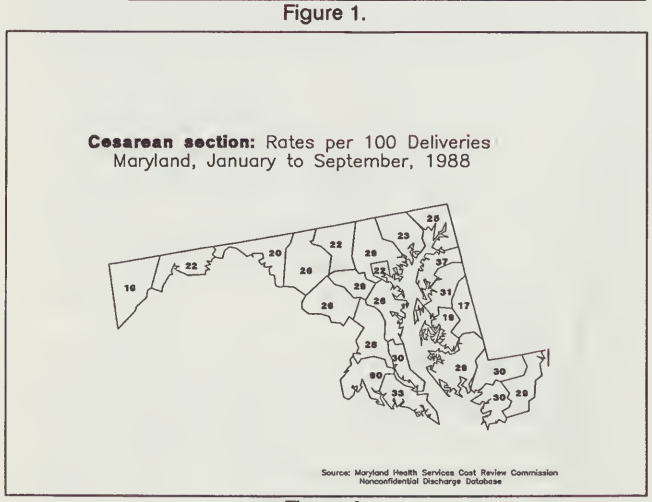

Figure 2.

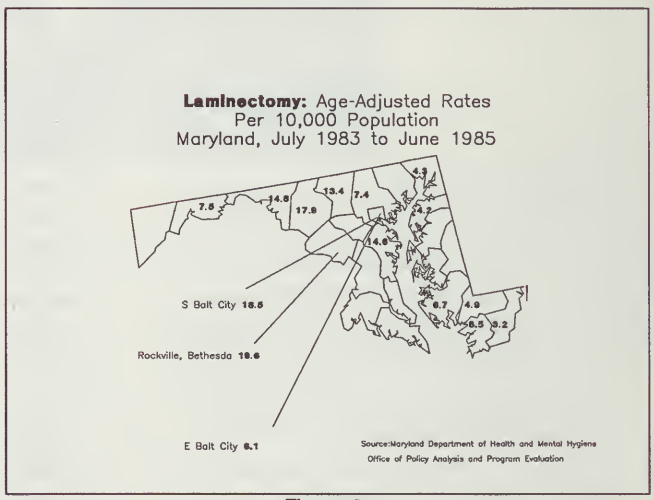

Figure 3.

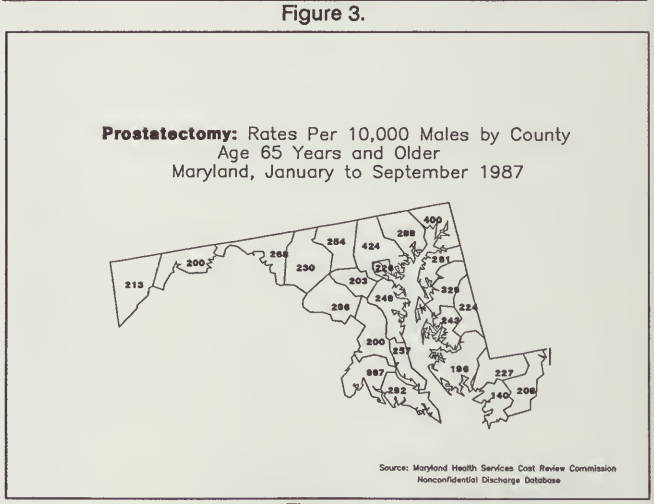

Figure 4.

Note: Not all counties have their data reported

utilization of health resources, and (3) the major incentive for the increased services was economic in nature. Each of these conclusions as well as their sequential linkage have been challenged.[10] Even so, variations in health services and costs are large enough to warrant investigation. Questions that should be answered include: How much of the variation represents underutilization or overutilization? How much of any excess or deficit is indeed due to physician practice patterns? How much is due to financing incentives? How much is driven by patient demand for services or lack thereof?

In an attempt to inform physicians about this important issue, members of the Small Area Practice Variation Committee undertook this review.

SAVA Methodology

Small area variation analysis (SAVA) uses population-based epidemiological methods for calculating and comparing rates of hospital utilization. The rate is the ratio of the number of residents receiving care for a particular condition during a period of time divided by the population in that area. There are a number of methods used to define an "area."[11] For instance, an area could be a county or a hospital service area defined as the region from which a hospital draws 80 percent of its patients. While rates can be compared for an entire population, one tries to estimate the rate of performance of specific procedures in the population at risk. Appropriate statistical tests can be used to assess the level of significance when variation is detected. For example, for tonsillectomy and adenoidectomy, the pertinent population would be the number of 1 to 18 year olds in each area. For prostatectomy, males over 65 years old would be the relevant population, and for hysterectomy, women over 45 years of age. Procedure rates for such groups can then be compared to an external reference point (the average for the region, the state, or the nation). The Table shows the rates for these procedures in Maryland compared to those cited by Wennberg and Gittlesohn,[12] as well as those by Stockwell and Vayda in Canada.[13]

Table. Hysterectomy, Tonsillectomy, and Adenoidectomy: Variation in Direct Age-adjusted Rates. Maryland and Other Areas.

Area	Hysterectomy Range of Rates per 10,000 Female Admissions	Tonsillectomy/ Adenoidectomy Range of Rates per 10,000 Population[1]
Maryland[2]	34 - 66	12 - 42
Maine, Vermont, Rhode Island, Connecticut, New Hampshire[3]	25 - 89	11 - 63
Ontario (Canada)[4]	41 - 203	23 - 191
Ontario (Canada)[5]	22 - 80	20 - 81

4. Stockwell and Vayda, Med Care 1979.
5. Vayda et al. Can Med Assoc 1984.

Another commonly used method of comparison is to display the magnitude of the difference between the highest and lowest rates for a given procedure as performed in different counties, states, or other population areas. Although the graphic nature of this depiction can rivet the attention of policymakers and payors, the data may be of questionable statistical validity since the variations at the extreme may be due to small sample size.[14-16] For example, comparing the ratio of the highest to the lowest rates for carotid endarterectomy (7.9/0.8), demonstrates a 9.8-fold variation between Kent and Worcester counties from 1983-1985 (Figure 1). The rest of the county specific rates of carotid endarterectomy showed much smaller differences. However, there were only 4 patients in Kent versus 55 in Worcester. When extreme values are considered, such small sample sizes can result in artifactual differences.

Where the sample size is sufficient for inferences to be made (for example, in the case of the Anne Arundel and Wicomico county rates for carotid endarterectomy 7.7 and 8.1/10,000 respectively, Figure 1), one tries to determine if the difference is significant (beyond two standard deviations from the mean or outside the 95 percent confidence limits). If it is, the inevitable question is: Why do these differences exist? If, as insurance companies, other payors, and policymakers would like to believe, the more appropriate rate is the lowest one, then the excessive numbers of procedures would represent overutilization and a significant excess in charges. But low rates might represent underutilization and insufficient access to care. Not being able to determine which is true has resulted in increasing pressures to develop guidelines for the performance of the procedures against which the appropriateness of a given procedure can be measured. Employee benefit managers, fiscal intermediaries, and the Health Care Financing Administration are working to develop such guidelines.[17,18]

Reasons for Variations

What, besides apparently inappropriate care, can explain such variations? There may be differences across geographic areas in patient severity of illness. This does occur in some instances. Susan Horn *et al.* have demonstrated large and statistically significant interhospital differences in patient severity among six hospitals.[19] Specifically, their study showed that the actual distribution of severity levels among the six hospitals was not reliably explained by hospital type

(teaching, nonteaching) or by resident-to-bed ratio. The use of areawide data may mask such hospital-specific differences.

A second reason for the variation could be patient pressures for receiving certain services. There is some accumulating evidence that this may play a role, especially, as Dr. Guy noted in 1856, in instances where patients have greater access to the health care system. Socioeconomic status, availability of insurance, cultural parameters, and educational levels are contributing factors.[20] For instance, the coronary bypass surgery rates are higher among whites than blacks with the same severity of illness.[21,22] Patient and physician scheduling preference has been cited as a partial explanation for differences in cesarean section rates;[23-25] however, a new study suggests that physician preference is a much more important determinant.[26]

A third reason for variation is differences among physicians. As Osler said, "medicine is the science of uncertainty and the art of probability."[27] Physicians differ as to the frequency with which they perform laboratory tests or actively intervene therapeutically. Such practice differences are more likely when there is less of a consensus in the diagnosis and treatment of particular conditions.[28,29] Wennberg's studies show that the variation is lowest where the indications are well-defined and the procedures well-accepted, such as for repair of inguinal hernia and hip fractures. For newer procedures, such as coronary bypass surgery, the variation is greater; and, for medical treatments, even greater.

To explain these differences a group at Rand has undertaken a number of retrospective studies using consensus criteria developed by a national panel of experts to define the appropriateness of the indication for specific procedures.[7,8] They found substantial inter-rater variability among three panels of physicians asked to rate the appropriateness of a large number of indications for six medical and surgical procedures. The panelists clearly agreed on ratings for 42 to 56 percent of the indications and clearly disagreed in from 11 to 29 percent for five of the procedures. The disagreement was even greater for colonoscopy. Since the judgment of appropriateness or inappropriateness is not an absolute, the panel used only those criteria where the panelists clearly agreed. They applied these criteria retrospectively in a review of records from patients undergoing coronary angiography, carotid endarterectomy, and upper gastrointestinal tract endoscopy in a number of geographic areas. They identified inappropriate use in 17 percent of coronary angiography cases, 32 percent of carotid endarterectomies, and 17 percent of upper gastrointestinal tract endoscopies. Such findings cannot be accepted uncritically but certainly can serve to initiate an educational exchange.

Economics and Technology

A fourth explanation is the economic incentive. Some have suggested that physicians wish to maintain a target income and that they perform procedures to guarantee this level. For example, a cesarean section is reimbursed at a much higher rate than a vaginal delivery even though the latter is often more time consuming and difficult for both provider and patient. Rice[31] investigated the target income hypothesis in a study of the practice pattern of physicians before and after Medicare in Colorado. Induced demand was demonstrated by the increase in both overall surgical services as well as more highly intensive surgical services per patient. Some of these changes probably represented the performance of previously deferred services. Nonetheless, reimbursement clearly led to greater frequency in the performance of given procedures, especially in the face of uncertainty about their indications.

A fifth reason is the increased availability of technology that provides another stimulus for increased utilization.[32] For example, the availability of special obstetric services (ultrasound or fetal monitoring) may alter the prevalence of cesarean sections (Figure 3). The presence of an anesthesiologist only at certain hours might affect whether a procedure is performed or when it is performed.

One classic example of the so-called technologic imperative[33] relates to hospital beds per capita. It was common wisdom for health policy analysts to cite Roemer's Law, " a built bed is a filled bed."[34] However, recent events surrounding the federal enactment of Prospective Payment have cast doubt on this law since there has been both a decrease in length stay **and** in occupancy rates throughout the United States.

Malpractice Fears

Last but not least, a factor cited by physicians for such variations is the fear of malpractice. For example, the increase in caesarean section rate has been ascribed partially to the fear of litigation against physicians if the baby is not perfect. Caesarean section allows the labor to be terminated and the baby to be delivered more easily, but the risk to the mother may be somewhat greater. Although the sample size was small, a recent study demonstrated that the individual physician, rather than the malpractice experience, was the most important determinant of cesarean section rate.[26]

Conclusion

Small area variation analysis provides a means for understanding the reasons for interarea variations in the use of medical care. Assuming the aforementioned studies accurately reflect inappropriate practice by today's standards, it is not clear what level of perfection is attainable in an imperfect world. However, this is the challenge the profession must face. It is essential that clinicians get involved in analyzing their own practices in a proactive rather than reactive manner. This is being done by medical societies in other areas.[35,36] After the demonstration of the variation in rates for tonsillectomy and other procedures, the medical society in Maine disseminated the information and

worked with local physicians to alter the rates to reflect currently accepted modes of practice. Similar cooperative efforts led to moderation in utilization rates for hysterectomy in Ontario.[37]

In Maryland, the Small Area Practice Variations Committee has been involved in a number of studies. In one case, we helped construct an expert panel and provided some support, along with the Maryland Hospital Association, for a study of coronary artery bypass surgery at two Maryland hospitals. These data are being analyzed and shared with physicians at those hospitals. We also have been working with the Maryland Hospital Association, which convened a panel of obstetricians to develop guidelines to evaluate cesarean sections and to review the disparities in cesarean section rates.[38] The results of their analysis were discussed at our Committee meeting with representatives of the Maryland College of Obstetrics and Gynecology and referred to the Faculty's Subcommittee on Maternal Welfare for review and dissemination. Chiefs of Departments of Obstetrics at Maryland hospitals will be asked to develop a more standardized review of cesarean sections. Further work is planned in the analysis of carotid endarterectomy, laminectomy, and prostatectomy.

Such analyses are not only useful in forestalling premature regulations but also, and more importantly, in enabling a better understanding of health care delivery in order to improve it. Where overutilization or underutilization of appropriately defined services is identified, action can be taken to correct deficiencies. Because these variations may have important implications for quality of care, access, and cost, it is essential to develop a partnership among physicians, hospitals, payors, and the public to attain more cost-effective and efficient care. Our Committee and the *Maryland Medical Journal* will be directing increasing attention to these issues. We look forward to a healthy response and involvement from Med Chi's membership.

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

SO WE CAN HOLD THE PREMIUMS DOWN.

FACT vs. FICTION

If you think you can effectively automate your office with anything less than CBSI's Physician Information System, think again.

MYTH: Personal computers are the system of choice for medical office automation.

FACT: That's wrong. Most medical offices require several people performing different tasks on the computer simultaneously. Multi-user, multi-processing super micro computers clearly offer power and expandability over personal computers. The number of medical offices dependent on real business automation solutions is enormous. PC buyers get stuck with slow, soon-to-be-obsolete systems. Adding a simple workstation as your needs grow is much more cost-effective than spending thousands of dollars on a new PC.

MYTH: No company has emerged with a dominant automation solution standing head and shoulders above all others in the Baltimore/Washington metropolitan area.

FACT: Five thousand of your peers and colleagues are currently using and are very satisfied with CBSI's Physician Information System. CBSI is truly the leader in this area for reliability, dependability, and cost-efficiency. In fact, CBSI is the only company endorsed by the Medical Society of D.C. and Montgomery County Medical Services Corporation.

MYTH: CBSI's Physician Information System costs too much.

FACT: When you explore all costs of providing an automation solution, you'll see that CBSI gives you more for your money. CBSI has developed its own software, specifically for the needs of medical offices. Different medical specialties all have unique requirements for billing, patient tracking, etc. For 12 years CBSI has offered the ability to tailor, change, and amend software for unique needs. Nobody but CBSI offers a staff of programmers for this purpose. Nobody offers the same level of training. And nobody else provides an implementation specialist—with medical office management experience—in your office for as long as it takes your staff to get up to speed.

Before you make up your mind about what system is best for automating your practice, find out the truth about CBSI. Find out why Physician Information System is the best choice for user flexibility, cost-efficiency, and software application effectiveness. ❑ Call CBSI in Rockville today at 770-2292. Elsewhere in Maryland call 1-800-638-6364.

Clinical Experience with Ketoprofen in the Management of Osteoarthritis and Rheumatoid Arthritis

Ira T. Fine MD

Dr. Fine is Head of the Division of Rheumatology, Sinai Hospital; and Instructor of Medicine, Johns Hopkins Hospital, Baltimore. Reprints: Ira T. Fine MD, 222 West Coldspring Lane, Baltimore, MD 21210.

A retrospective review was conducted among 38 patients who were prescribed the nonsteroidal anti-inflammatory drug (NSAID) ketoprofen by a rheumatologist in private practice. Many of these patients were in advanced stages of disease and had been refractory to previous treatments. The percentages of patients with osteoarthritis (OA) and rheumatoid arthritis (RA) who improved on ketoprofen therapy were 87 percent and 73 percent, respectively. Adverse effects were generally mild and transient. Because of its overall effectiveness, relative safety, and patient acceptance, ketoprofen has proved to be a valuable addition to the array of anti-inflammatory medications.

Over 100 forms of musculoskeletal disorders affect approximately 50 million persons in this country. While the etiology and cure of many arthritis disease processes remain elusive, the number of drugs available to ease the pain and reduce the inflammation associated with arthritic diseases has increased, improving the outlook for patients.

History

When Dr. William Osler described rheumatic disease at the beginning of this century in *Principles and Practice of Medicine*,[1] four conditions were identified: arthritis deformans, chronic rheumatism, muscular rheumatism, and gout. Today we can distinguish over 100 forms of musculoskeletal disorders affecting approximately 50 million persons in the United States; they include the most recent additions, Lyme arthritis, eosinophilic fasciitis, and Kawasaki's disease. While our knowledge has expanded in the intervening years, the etiology and cure of many arthritis disease processes remain elusive. Nevertheless, the number of drugs available to ease the pain and reduce the inflammation associated with arthritic diseases has increased, improving the outlook for patients.

The development of nonsteroidal anti-inflammatory drugs (NSAIDs) has been of tremendous benefit in the alleviation of arthritic disease symptoms. More than a dozen NSAIDs are available for use in the United States, and they can be considered the cornerstone of today's pharmacological approach to treatment.

The chronic nature of arthritic diseases and the variable responses of patients to specific treatment regimens require flexible and individualized patient management. Although alternating

periods of exacerbation and remission of symptoms are a hallmark of rheumatic diseases, continuous therapy with NSAIDs is generally more efficacious than treatment solely when pain or inflammation are present; sudden cessation of therapy may cause a flare-up of disease activity.

The NSAID ketoprofen,* a propionic acid derivative that became available in the United States in 1986, has been beneficial for many patients with osteoarthritis (OA) or rheumatoid arthritis (RA). Prior to its introduction in this country, this potent and rapidly absorbed agent[2-4] had been used for over 13 years by physicians worldwide.[5-7] In a postmarketing study[8] of 1,307 patients previously taking leading NSAIDs, 50 percent of patients reported ketoprofen to be more efficacious than were their former medications; and in 85 percent of cases patient tolerance with ketoprofen was superior or equal to that of prior medication. Ketoprofen has an outstanding record of freedom from serious adverse reactions during short- and long-term administration.[5,6] Older patients, particularly, do well on treatment because ketoprofen has a short plasma half-life and is eliminated rapidly, hence preventing drug accumulation and reducing risk of serious side effects.

My experience with ketoprofen in patients with moderate to severe OA and RA follows. It is based on a review of office case records of patients referred for rheumatologic consultation who had experienced either unsatisfactory relief of arthritic symptoms or unacceptable adverse drug reactions from prior NSAID therapy.

Case Reports

Case records of 38 patients with OA or RA who were prescribed the nonsteroidal anti-inflammatory drug ketoprofen were reviewed. Almost all the patients had been referred by family physicians or internists. These patients, many of whom had concomitant diseases, represented more severe cases than those customarily treated in a primary care practice. Diagnosis was determined after a history of each patient was completed and a thorough physical examination performed; where necessary, laboratory tests were run and roentgenograms taken.

Drug therapy prescribed for a majority of patients prior to ketoprofen included naproxen 375 to 500 mg twice daily; discontinuation of this NSAID in selected patients became necessary because of lack of efficacy or adverse effects, particularly gastrointestinal. Another NSAID commonly administered was sulindac 150 to 200 mg twice daily, which also had to be discontinued in selected patients because of either lack of efficacy or adverse effects. Other drugs previously used in this group of patients included piroxicam, ibuprofen, indomethacin, tolmetin, meclofenamate, and phenylbutazone.

OA was the diagnosis in 23 of the 38 patients and RA in 15 patients. Demographic characteristics of each patient group are summarized in the Table. Females predominated in both groups. The mean age of the patients correlated with the average age of patients in the general population in whom symptomatic effects of RA occur as early as the second decade and OA more commonly in the fourth decade. Duration of disease ranged from 1.5 to 20 years, with a mean of 8 and 6 years in the OA and RA groups, respectively.

The knee was the focus of pain for 63 percent of patients with OA; other major areas of pain were the lumbar spine, hip, and shoulder. Primary areas of pain in patients with RA were the hand and wrist in 53 percent of patients and the knee in 40 percent. Other involved peripheral joints included the shoulder, elbow, spine, and foot. With few exceptions, the prescribed dosage of ketoprofen was 75 mg every eight hours, taken with food.

Results

Response of OA Patients Twenty-three patients received ketoprofen for treatment of moderate to severe OA. Eighty-seven percent of patients showed improvement in response to ketoprofen at their last visit; many had excellent results. Thirteen percent of patients failed to respond to ketoprofen. Maximum duration of treatment was nine months up to the time of this review.

The severity of specific arthritic symptoms was evaluated before and after administration of ketoprofen. A rating system was developed *post facto* on a scale of 0 to 4, indicating no pain to very severe pain. Ten patients were evaluated for joint pain at rest, and mean response to ketoprofen was good. Pain severity ratings decreased by 41 percent, from 2.7 to 1.6 (Figure). Nine patients were evaluated for joint pain on movement; their mean severity rating decreased by 34 percent, from 2.9 to 1.9 after ketoprofen.

Overall, patient tolerance of ketoprofen was very good. Eleven adverse effects were reported by nine patients; two patients (8 percent) discontinued therapy as a result of adverse effects. Patient 19, a 50-year-old man, discontinued treatment after five months due to stomach burning. He had experienced severe OA for approximately ten years. Patient 24, a 58-year-old

Table. Demographic Characteristics of 38 Arthritis Patients (OA and RA)

	Sex	Number	Age(yr.)		Duration of Disease(yr.)	
			Mean	Range	Mean	Range
Osteoarthritis (N=23)	M	4	63	50-74	8	5-12
	F	19	61	40-80	8	1.5-20
	Mean	-	61	40-80	8	1.5-20
Rheumatoid arthritis (N=15)	M	1	71	71	-	-
	F	14	48	27-72	6	1-18
	Mean	-	50	27-72	6	1-18

*Orudis,® Wyeth-Ayerst Laboratories

woman who had been intolerant of many antiarthritic medications, discontinued ketoprofen after approximately one month because of stomach ache and leg rash. Ketoprofen had been controlling her arthritis symptoms.

Response of RA Patients Fifteen patients, most with advanced forms of arthritis, received ketoprofen for treatment of RA. Seventy-three percent of patients improved in response to therapy. Maximum duration of treatment with ketoprofen was 15 months in patient 37 who had a good to excellent response.

Six adverse effects were reported by four patients, with discontinuation of therapy required in two patients (13 percent). Patient 32, a 64-year-old woman experiencing severe RA for one year and previously intolerant of other NSAIDs, discontinued ketoprofen after two months because of hematologic abnormalities thought to be possibly related to the NSAID. Patient 33, a 49-year-old woman, had experienced severe RA involving her knees, hands, and wrists for three years. After two weeks' use of ketoprofen, she developed gastrointestinal problems and had to stop the medication.

Two case histories illustrate typical OA and RA patients in my practice who received ketoprofen:

Case No. 14, a 76-year-old woman, has had OA for approximately 20 years, during which time numerous medications have been prescribed. She was referred to the office in 1984 complaining of multiple peripheral joint pains. She had low back pain radiating to the left buttock and thigh on straight leg raise. Initial physical examination revealed mild swelling of the right knee and pain on range of motion of the right shoulder. She was placed on salsalate 1250 mg twice a day. Her symptoms eased although she experienced abdominal discomfort and was slightly groggy from the medication. In March 1986, she was switched to ketoprofen 75 mg every eight hours. At that time swelling and joint pain at rest were moderate, and knee joint pain with range of motion was severe. By the next week her response to ketoprofen was judged to be good. Knee joint pain on motion was considered moderate. A month later symptoms were still well controlled, although she reported moderate dyspepsia, which improved with antacid administration. At her next scheduled evaluation three months later, joint pain on motion had further improved and was rated mild; response to ketoprofen was considered good to excellent. Her earlier difficulties with dyspepsia had resolved.

Case No. 24, a 47-year-old female, was initially evaluated in 1982. At that time, she had severe shoulder and right knee pain attributable to RA for which NSAIDs and disease modifying agents were prescribed. Her most recent medication prior to treatment with ketoprofen included prednisone, which helped to control her severe inflammation but produced limiting side effects. Diflunisal 1500 mg daily did not help. In 1986 she was prescribed ketoprofen 75 mg every eight hours. At initiation of treatment, she was experiencing severe joint pain at rest and on range of motion. Prednisone 5 mg daily was added for two weeks to help relieve acute symptoms. The pain at rest and on motion eased, although it was still severe when prednisone was subsequently tapered and discontinued. After three months of treatment with ketoprofen alone, she reported moderate joint redness and heat but not the severe joint pain experienced previously. After another six months, her overall response to treatment with ketoprofen was judged to be good.

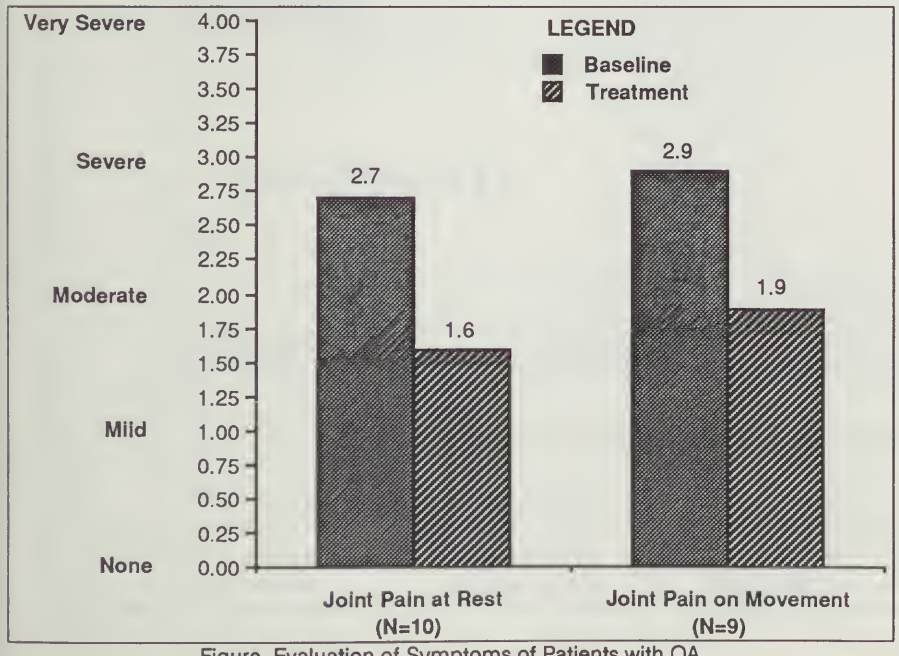

Figure. Evaluation of Symptoms of Patients with OA

Discussion

In this retrospective review of 38 patients with moderate to severe disease, 87 percent of patients with OA and 73 percent of patients with RA improved during ketoprofen therapy. Ketoprofen, a short-acting NSAID and a potent inhibitor of major mediators of inflammation, was effective in reducing inflammation manifested by heat, redness, and joint pain at rest and on motion in both groups of patients.

The multiple-dosing regimen of ketoprofen did not adversely affect patient compliance. In fact, findings of a study of arthritic patients conducted in 1985 indicated that 70 percent of patients preferred a multiple-dosing schedule because of their perception that such a schedule increased effectiveness.[9] Patients given ketoprofen 75 mg every eight hours also gain the flexibility of taking

an additional capsule for pain relief when necessary without exceeding the recommended daily dose of 300 mg.

With regard to adverse effects, few were severe enough to warrant discontinuation of treatment. The short plasma half-life of ketoprofen and its simple conjugative metabolic pathway may explain this.[7] Gastrointestinal adverse effects were the most common cause for discontinuation of therapy and were similar to the adverse effects occurring with other NSAIDs.

My experience with ketoprofen has shown it to be an effective nonsteroidal drug in patients with osteoarthritis and rheumatoid arthritis. It has been particularly effective in pain relief as well as having a low frequency of significant side effects. Its metabolic and kinetic characteristics make is especially well suited for elderly arthritic patients. Many patients who previously had unsatisfactory results with other NSAIDs and were switched to ketoprofen subsequently improved. Adverse side effects generally were not serious. Ketoprofen, with its documented record of efficacy and safety, provides physicians with an effective treatment regimen to relieve the pain and reduce the inflammation of OA and RA.

Predictors of Rehabilitation Outcome among Patients with SCI

Robert S. Epstein MD, MS; Alan Lefkowitz MD, MS; Catherine M. Sharkness MD, MS; Jeffrey P. Struewing MD, MS; Doris A. Cadigan PhD; Irving I. Kessler MD, Dr PH; and James P. Flynn MD, MPH

Drs. Epstein, Lefkowitz, Sharkness, Struewing, Cadigan, and Kessler are with the University of Maryland Medical School, Department of Epidemiology and Preventive Medicine Dr. Flynn is with Montebello Rehabilitation Hospital, University of Maryland Medical System.

This study was supported in part by Grant No. D33-PE-13000 of the Department of Health and Human Services as well as from the general funds of the Department of Epidemiology and Preventive Medicine, and the Montebello Rehabilitation Hospital.

Because rehabilitation medicine has undergone major changes with respect to patient management and case mix since 1980, it is important to determine whether the factors predictive of rehabilitation outcomes also have changed over time.

Injuries of the spinal cord affect an estimated 10,000 Americans each year, and a significant number of patients sustain disability.[1] After the acute hospital phase of care, patents with spinal cord injury (SCI) often are referred for rehabilitation. In recent years, this service has been centralized to concentrate care and improve services to SCI patients.[2]

Several recent studies examined predictors of rehabilitation outcome. Woolsey studied a veteran population and found that age, marital status, and level of injury were predictive of outcome.[3] In an earlier cohort, Yarkony *et al.* looked at 711 patients and found level and completeness of injury to be important predictors.[4] Rintala and Willems studied 39 patients in 1981 and found postdischarge outcomes affected by setting (urban vs. rural), race, speed of recovery, independence in the ward, and degree of injury.[5]

Rehabilitation medicine has undergone major changes with respect to patient management and case mix. In our recent study of SCI patients,[6] secular changes were found in educational and occupational status, length of stay, and number of medical complications. Therefore it is important to determine whether the factors predictive of rehabilitative outcomes have changed over time.

The present study examined the functional outcomes of spinal cord injured patients following inpatient rehabilitation.

Procedures

The records of all patients discharged from the Spinal Cord Injury Unit of Montebello Rehabilitation Hospital during calendar year 1986 were abstracted. This institution is a 153-bed comprehensive rehabilitation facility and a division of the University of Maryland Medical System. The 20-bed unit has been in operation since 1979.

The medical records of 135 SCI patients were abstracted. Those who had been treated previously in a rehabilitation center or who initially had been discharged prior to 1986 were excluded. Patients sustaining vertebral fractures without spinal cord deficits, those with significant head trauma, those whose spinal cord lesions had an insidious onset or relapsing course, or those treated in another unit of the hospital also were excluded. A total of 77 patients remained for study.

A modified Barthel's Index (BI) was constructed from the nursing, occupational, and physical therapy notes. This is based on the ability to perform 10 activities of daily living (ADLs) with a higher score indicating better functional ability.[7] Individual items were scored a value of 1 if independent, and 0 if help was needed. Two items (bathing and climbing stairs) with more than 20 percent missing values were excluded, resulting in a maximum score of 8. Scores were standardized by dividing the number of items a patient could performs independently by the number of non-missing items.

Four of the authors (Epstein, Sharkness, Struewing, and Lefkowitz) abstracted the patients' charts using a standard form. Information obtained included demographic data, cause of injury, level and degree of injury, functional ability on admission and discharge, medical complications, length of stay, and disposition on discharge. The injuries were classified according to the Standards for Neurological Classification from the American Spinal Injury Association.[8]

After abstraction, data were coded, edited, and validated. The PC version of the Statistical Analysis System (PC-SAS) was used for data analysis. Mean values were compared using the Student *t*-test, and differences between proportions were evaluated by the chi-square statistic.

To analyze functional changes during rehabilitation, the difference of standardized Barthel Index scores (discharge BI score - admission BI score) was divided by the admission score. This adjusts the discharge score by the admitting score.

To identify factors that have an effect on functional status at the time of discharge, a multiple linear regression was performed. The dependent variable was the BI score on discharge from rehabilitation while the independent variables were those known or suspected to have some bearing on function: age, race, sex, occupation, education, level and degree of injury, number of medical complications, admitting Barthel Index score, acute hospital length of stay, and rehabilitation hospital length of stay.

Results

The SCI patients had a mean age of 38 years and 80 percent were male. There were 43 blacks (55.8 percent) and 34 whites (44.2 percent), with approximately 53 percent living in Baltimore City. Two-thirds of them were single, 53 percent had completed high school, and 61 percent were employed at the time of injury. Their mean length of stay was 74 days, ranging from 1 to 265 days. The mean number of complications per patient was 1.8.

Approximately 75 percent of the study population had improved in function at the time of discharge. Of the remainder, 2 percent deteriorated during the rehabilitative course, while the others experienced no change in function. The two groups did not differ substantially in race, marital status, and education (Table 1). However, the patients who improved were more likely to be unemployed and an average of 10 years younger than those who did not improve. Male patients were more likely to be in the improved category than were females. Patients injured by violence were more likely to improve than were those injured in motor vehicles.

The medical characteristics of the patients who improved and those who did not are shown in Table 2. Although the differences generally were not statistically significant, relatively more lower cord lesions and paraplegia were seen in the improved group than in the unimproved group. There was no difference in the overall frequency of medical complications although decubiti were almost three times more common in the unimproved patients.

The results of the linear regression analysis of functional status at discharge are presented in Table 3. The significant predictors of better functional status at dis-

charge were (1) admitting functional status, (2) male sex, and (3) lower level of injury. The variables not predictive of outcome included age, race, education, employment status, degree of injury, presence or numbers of complications, and length of stay in either the acute or the rehabilitation hospital.

Discussion

This study provides additional findings regarding functional outcomes following rehabilitation. It differs from most other studies in that this analysis controlled for the admitting functional status.

Seventy-five percent of the patients showed improvement in one or more measures of functional status during their rehabilitation course. Sixty-three percent of the patients with cervical lesions improved, while 80 percent of the thoracic and 82 percent of the lumbosacral patients showed improvement. These figures are higher than those reported elsewhere.[3,9,10] One possible explanation is that these differences are artifactual, that is, due more to the definition and measurement of function than to actual differences. Another possibility is that in general the rehabilitation of SCI patients improved since the earlier studies. Since patients are now admitted for rehabilitation after a shorter acute hospitalization, it is also possible that improvement in function has shifted to the rehabilitative phase.

We expected the unimproved patients to encounter a greater frequency of complications, but this did not occur. In fact, the improved and unimproved patients did not differ in the frequency of complications except for decubiti, which were three times more common among the improved group. Perhaps the shortened length of stay shifts the complications to the postdischarge period.

The Barthel Index score on admission, cord level, and male sex are predictive of patients likely to show the greatest functional improvement. Patients who are functionally more independent on admission are able to register greater gains than do those in poorer functional states. Patients with lower anatomic cord lesions showed better rehabilitative outcomes. However it is unclear why males recover more function than do females, adjusting for other differences. Our analysis lacks power, however, because of the paucity of females in the cohort (there were 15 females in the study). In any case, they were more likely than males to have cervical lesions (53 percent vs. 35 percent), and quadriplegia (46 percent vs. 35 percent).

Despite adjustment for these differences, it is possible there are other unmeasured differences that need to be accounted for. Although Montebello Rehabilitation Hospital accepts patients from the entire state of Maryland, it does not admit randomly from the entire region but rather from the metropolitan Baltimore area. Further studies are needed that include additional providers of care from the various catchment areas of the state. The number of patients studied is also relatively small. Finally, it is recognized that more information than can be ascertained from charts alone is required to fully explain differences between those who improve and those who did not.

This study does not address the impact of rehabilitation on functional outcome but attempts to classify those patients who achieved the greatest functional gains in a rehabilitative setting. We hope this type of analysis will permit rehabilitative specialists to better understand, discuss, and decide on the types of patients who could benefit most from rehabilitation. We also hope that new approaches may be developed to improve the status of target groups that show little improvement from traditional multidisciplinary rehabilitation efforts.

Acknowledgments

The authors thank the Medical Records Department at Montebello, Mike Stitcher, and the Health Data Management Center from the University of Maryland Medical School for their assistance in this project.

Dietary Fluoride Supplements: the Maryland Physician's Role

Michael W. Easley DDS, MPH; Steven M. Levy DDS, MPH; and Raymond A. Kuthy DDS, MPH

Dr. Easley is Chief, Division of Dental Health, Maryland Department of Health and Mental Hygiene, Baltimore. Dr. Levy is Assistant Professor, Department of Preventive and Community Dentistry, College of Dentistry, University of Iowa, Iowa City. Dr. Kuthy is Assistant Professor, Section of Community Dentistry, College of Dentistry, Ohio State University, Columbus. *Articles similar to this are being published in many state medical and dental journals as part of a series approved by the Association of State and Territorial Dental Directors.*

Appropriate use of fluoride, either systemically or topically, remains the best defense against dental caries.

The appropriate use of fluoride remains the best defense against dental caries. This is true despite extensive efforts to develop improved methods of mechanical plaque removal, to develop chemical agents that safely and effectively reduce the cariogenic activity of bacteria, and to reduce the frequency of intake of cariogenic foods by modification of dietary practices.[1] Pit-and-fissure sealants are an important weapon in caries control,[2] but their full impact depends heavily on the ability of fluorides to control smooth surface caries. Although the mechanisms by which fluorides exert their caries-inhibiting effects are not fully understood, they are thought to include:

- Reduction of enamel solubility
- Remineralization of early carious lesions
- Action on plaque bacteria

Greater interest in and understanding of the remineralization process in recent years has led to such discoveries as the reversal of many early carious lesions with proper fluoride treatment.

Fluoride products are intended for use either systemically or topically. Systemic fluoride is ingested, absorbed, and incorporated into developing bone and tooth structure. In contrast, topical fluorides work only locally on plaque and the superficial layers of enamel. Methods of delivering systemic fluorides in the United States include community water fluoridation, school water fluoridation, and dietary fluoride supplements. Topical fluorides may be applied professionally or self-applied. They include fluoride solutions and gels (applied in trays or with a toothbrush or applicator), fluoride dentifrices, and fluoride mouthrinses. Topical benefits also result from drinking fluoridated water or from chewing fluoride tablets.

Discussions of fluoride delivery methods are contained in a special section in the September 1986 *Journal of the American*

DentalAssociation, "A Guide to the Use of Fluorides for the Prevention of Dental Caries,"[3] and in the American Dental Association's *Accepted Dental Therapeutics*.[4] A comprehensive fluoride program should include a systemic form and may include one or more topical forms. The systemic and topical modes should not be used in lieu of the other but should complement each other.

Several studies have found that the majority of dentists and physicians reported prescribing dietary fluoride supplements for some of their child patients.[5-9] However, other studies have shown that some practitioners are unaware of the proper supplement protocol (including water fluoride testing, when necessary), dosage guidelines, and the actual fluoride concentrations in the area's main water supplies.[5-11]

We will explain the need for dietary fluoride supplements in Maryland and review the proper protocol for their use; this should assist the practitioner in providing optimum preventive care to young patients.

Need for Systemic Supplements

Community water fluoridation is the most efficient and cost-effective method of providing systemic fluoride for the prevention of dental caries.[12] Unfortunately, almost half the population of the United States drinks water that is not optimally fluoridated.[13] In Maryland, approximately 96 percent of the population served by community water systems is receiving fluoridated water.

Alternative sources of systemic fluoride are necessary if more children are to be provided the caries preventive benefits of systemic fluoride. School water fluoridation is one alternative, but it is not presently being used in Maryland.

Generally, the water from school fluoridators contains 4.5 times the optimal level of fluoride for community water fluoridation in that particular geographic area to approximate the fluoride intake that would take place if the children were drinking water fluoridated at the average optimal 1.0 ppm all day, every day. The students drink the school water only for a few hours on school days (approximately 180 days per year). Children who drink school water fluoridated at 4.5 times optimal will experience substantial caries reductions of up to 40 percent. The benefits are particularly great in the late-forming teeth, which receive both systemic and topical exposure.[14]

Children who drink water from an optimally fluoridated community system or a school fluoridation system should not receive systemic fluoride supplements. Specific information about the concentration of fluoride in your community's water supply may be obtained from your local water company, health department, or dental public health personnel. Dr. Michael Easley, Chief of the Division of Dental Health, Maryland Department of Health and Mental Hygiene, also can provide lists of communities in Maryland that are optimally fluoridated.

Fluoride Supplements

For children who do not receive fluoridated water, the use of dietary fluoride supplements (tablets or drops) is a safe and effective means of reducing the incidence of dental caries by up to 60 percent or more [15-22] and has been recommended for use in private practices.[23] To receive maximum preventive benefits, the supplements must be taken daily from birth until at least age 13,[4] although taking them until age 16 is better.

Supplement Protocol

It is important that children receive the appropriate dose of systemic fluoride. This can be accomplished only if the practitioner knows the fluoride concentration of the patient's main source of drinking water. (Occasionally, more than one important patient water source must be considered and the average fluoride level determined.) Fluoride levels exceeding the optimal are associated with an increased risk of dental fluorosis (mottling).[24] Although fluorosis is primarily a cosmetic problem, severe cases can involve pitting of the tooth surface. To avoid exceeding the recommended dose, the practitioner should know which communities in the area are fluoridated as well as the concentration of fluoride.

A separate water sample should be submitted to determine the fluoride content of a patient's community, school, or individual water supply if the practitioner does not have prior specific knowledge of the level. Because there can be significant variations in water fluoride content from nearby wells, even in a small geographic area, one should not rely on the results of a sample from a different source, no matter how near.

Water Sampling Procedures

In Maryland fluoride assay services are available but must be accessed through individual local health departments. For further information please direct your inquiries to:

Michael W. Easley DDS, MPH
Chief, Division of Dental Health
Maryland Department of Health and Mental Hygiene
201 West Preston St., Room 321
Baltimore, MD 21201
(301-225-6789)

Dosage Schedule

The present guidelines for systemic fluoride supplements recommended by the American Dental Association, the American Academy of Pediatric Dentistry, and the American Academy of Pediatrics are shown in the Table.[4,25-27] Any water fluoride level greater than 0.3 ppm requires adjustment from the full dosage supplement.

Determining Appropriate Dosage

After determining the fluoride level of a patient's main source of drinking water (either by submitting samples or obtaining information from water companies, schools, Maryland Department of Health and Mental Hygiene, etc.), the practitioner must determine the appropriate supplement dosage (if any) to prescribe. For example, a four-year-old with a water fluoride level of 0.5 ppm would receive a 0.5 mg supplement instead of the full supplement dosage of 1.0 mg appropriate were the water fluoride level to be 0.2 ppm.

The practitioner must determine whether an infant is being exclusively breast-fed, bottle-fed, or obtaining nutrition from both sources. Totally breast-fed babies should be supplemented fully, since very low amounts of fluoride are found in human milk, even when the mother resides in a fluoridated area.[28] The major manufacturers of milk-based infant formulas have removed fluoride from their products, which previously contained variable levels.[29] An infant on milk-based formula now receives fluoride almost exclusively from the water that may be mixed with the formula.[29] The practitioner must determine the proportion of bottle-feeding and reduce the supplement accordingly for those infants receiving nutrition from both sources.

Since excessive fluoride can cause fluorosis, parents should contact the provider of the supplement (physician or dentist) when changes occur in the infant's consumption of liquids so the fluoride supplementation can be adjusted. Significant changes in feeding patterns (such as from breast-feeding to bottle-feeding or breast-feeding to solid foods) must be reported to the provider so that the dosage of fluoride supplements can be adjusted, if necessary.

Although children should see the dentist at a young age, most children do not see a dentist before age 3. Therefore, the complexities of controlling fluoride dosage for infants and younger children must be the joint responsibility of dentists and physicians. Both should provide guidance in regulating supplement dosage. Also, it is important to remind the physician that dosage typically must be adjusted at ages 2 and 3.

Determination of water fluoride levels and systemic fluoride needs may be best accomplished as routine parts of new and recall patient examination procedures for pregnant women and children under age 16. Delegation to dental hygienists of some of these responsibilities has been suggested in order to facilitate the process.[9]

Fluoride tablets are available in 0.25, 0.5 and 1.0 mg fluoride formulations. There are several commercial brands available.[3] (See also List of Accepted Products-Fluoride Supplements in the February 1988 issue of *Journal of the American Dental Association*.) Additionally, many pharmacies can provide a generic product. The tablet should be chewed before swallowing to provide topical benefit. Fluoride drops, often providing 0.125 mg or 0.25 mg of fluoride per drop, should be used for those who cannot chew a tablet. No more than 264 mg sodium fluoride (or 120 mg fluoride) should be prescribed at one time for safety reasons.[4] The product should be kept in a childproof container in a secure place. Sample prescriptions are shown below for 0.5 mg fluoride dosage tablets and 0.25 mg fluoride dosage drops.

The greatest difficulty with fluoride supplements is patient compliance.[18-21,30] Numerous studies have documented the effectiveness of fluoride supplements in reducing dental caries, but the supplementation schedule must be followed conscientiously. These studies have shown that the greatest caries reductions have occurred as a result of select populations seeking pediatric dental or medical care on a regular basis; the reduction also is a result of follow-ups from dedicated and enthusiastic dentists and physicians who were able

Table. Supplemental Fluoride Dosage Schedule* (in mg of Fluoride Per Day)

	Parts per Million Fluoride in Water Supply		
Age of Child	<0.3	0.3 to 0.7	0.7
Birth to 2 yrs+	0.25	0	0
2 to 3 yrs	0.50	0.25	0
3 to 13 yrs+	1.00	0.50	0

*Recommended by the Council on Dental Therapeutics of the American Dental Association, by the Committee on Nutrition of the American Academy of Pediatrics, and by the American Academy of Pediatric Dentistry.

+The American Academy of Pediatrics recommends providing supplements from 2 weeks through at least age 16.

Sample Prescriptions

Rx Sodium Fluoride Drops
0.25 mg F/drop
Dispense: 24 ml
Sig: Place one drop daily inside mouth or add to water, formula, or foods.
Caution: Keep out of reach of children

NOTE: This is a generic prescription for fluoride drops to be used when 0.25 mg fluoride is needed, that is, from birth to 2 years with drinking water containing less than 0.3 ppm fluoride.

Rx Sodium Fluoride Tablets
1.1 mg (0.5 mg F)
Dispense: 120 tabs
Sig: Chew one tablet daily before bedtime, swish for 60 seconds, and swallow.
Caution: Keep out of reach of children

NOTE: This is a generic prescription for fluoride tablets to be used when 0.5 mg fluoride is needed, that is, for a 2-year-old with drinking water containing less than 0.3 ppm fluoride or a child aged 3 to 13 with water fluoride content between 0.3 and 0.7 ppm.

to motivate the patients to comply with the dosage regimen. Therefore, physicians and dentists must routinely encourage and attempt to monitor the child's supplement use.

Conclusion

We hope this article will encourage and assist physicians and dentists in Maryland in providing appropriate doses of systemic fluoride supplements to those children in need. The dental profession must work closely with physicians and other health professionals if systemic fluorides are to be used to greatest benefit by our population.

Summary

1. All children should receive one form of systemic fluoride and appropriate forms of topical fluoride.
2. If a child is not receiving optimally fluoridated water, the dentist or physician should prescribe dietary fluoride supplements (tablets or drops).
3. The correct dosage must be determined based on patient age and fluoride content of the patient's main water source(s).
4. Special attention is necessary concerning fluoride intake for children breast-feeding or consuming infant formula.
5. To arrive at the correct fluoride dose, these steps should be followed:

A. Always have a sample of the main drinking water source (usually home water) analyzed for the fluoride content before prescribing a fluoride supplement, if you do not have other **specific** knowledge of water fluoride content. Dr. Easley, Chief of the Division of Dental Health, Maryland Department of Health and Mental Hygiene can provide health professionals information regarding fluoride assay services available.

B. When the fluoride content of the water has been determined, the fluoride level and the child's age should be matched on the Table to arrive at the correct supplement dose.

6. Dr. Easley, Chief of the Division of Dental Health, Maryland Department of Health and Mental Hygiene, can provide lists of optimally fluoridated communities and schools in Maryland.

Where do you draw the line?

As a mental health professional, you know that every patient represents a unique challenge. In most cases, you are able to meet each person's individual needs with effective treatment and positive results.

But there are some cases that frustrate the best efforts of the most dedicated professional . . . individuals whose problems seem resistant to every avenue of outpatient treatment. As a concerned professional, where do you draw the line between giving patients your best and drawing on the inpatient resources of others?

For more than 80 years, Taylor Manor Hospital has provided welcome support to fellow professionals faced with the patient in need of our inpatient setting. Our multi-disciplinary approach welcomes your input and provides a broad base of psychiatric services, including specialized treatment programs for adolescents, adults, young adults, addictive behaviors, and members of the ministering profession.

We're here to use all our experienced staff and facilities to assist you in working with your patients. For further information or to arrange admission, contact our Admissions Office at **1-800-527-8238, (301) 465-3322 or (202) 621-4965.**

THE SECRET IS OUT

"I became aware of the Southern Medical Association through the insurance program. My father has worked in insurance nearly all of his life and was interested in me getting a good policy and he said SMA had some of the best policies around."

James F. Beattie, M.D.
Pathology
Chattanooga, TN

Since 1906, the Southern Medical Association has been the best kept secret in the South. No longer! The word is out and everybody's talking.

They're talking about the educational benefits of belonging to the largest regional multi-specialty association in the U.S. and the diversity of the Annual Scientific Assembly.

They're talking about a non-political association whose only mission is to provide the best educational and financial benefits available anywhere.

They're also talking about unrivaled member benefits including the SMA Insurance Program, the Physicians' Purchasing Program, the SMA Retirement Program, SMA Travel Services, Dial Access, the *Southern Medical Journal* and many, many more.

But most of all, they're talking about how SMA can offer so much at such a low cost.

Call the SMA for more information and a membership application. Find out why more and more physicians are joining the SMA every day.

Join the SMA today . . . You'll be talking about us too!

State of Maryland
Department of Health and Mental Hygiene
In the Matter of
Richard P. Buyalos MD
Before the
Board of Review

Order

On consideration of the arguments to the Board of Review at a hearing held on September 15, 1988, and the entire record of the case, it is this 3rd day of October 1988

ORDERED, that the decision of the Board of Medical Examiners of the Department of Health and Mental Hygiene is AFFIRMED and the Findings of Fact and Conclusions of Law of the Board of Medical Examiners are hereby adopted by the Board.

MILDRED TYSSOWSKI, Chairman

Richard P. Buyalos MD
Plaintiff/Appellant
v.
Board of Review of the
Department of Health and Mental Hygiene,
State of Maryland
Board of Medical Examiners
(now known as the State Board of Physicians Quality Assurance)
Of the Department of Health and Mental Hygiene,
State of Maryland
Defendants/Appellees
In the Circuit Court for Anne Arundel County

Order

For the reasons given in its oral opinion, given this date in open court, it is this 19th day of December 1988

ORDERED, that the decision of the Board of Review of the Department of Health and Mental Hygiene and the State Board of Physicians Quality Assurance is affirmed. Costs to be paid by the Appellant.

ROBERT H. HELLER, JR., Judge

In the Matter of
Richard P. Buyalos MD
Before the
Maryland State Board of
Medical Examiners

Findings of Facts
Conclusions of Law, and Order

Background

By letter dated October 20, 1986 the Maryland State Board of Medical Examiners ("the Board") initially denied Respondent's application for renewal of his license based on Sections 14-205 and 14-504 of the Health Occupations Article, *Annotated Code of Maryland* ("the Act"). Subsequently the Board by letter dated May 12, 1987 reaffirmed its denial of Respondent's application for renewal but amended the grounds for denial. The Board based its denial on Section 14-305 of the Health Occupations Article, Annotated Code of Maryland under which the Board may deny renewal of a license to an application for lack of good moral character.

By letter dated May 28, 1987 the Respondent was advised that the Board had voted to sustain its previous action to deny Respondent's application for renewal of his license to practice medicine in Maryland based on the lack of good moral character pursuant to Health Occupations Article, Section 14-305 following an informal meeting with Respondent on May 21, 1987.

A hearing on the denial of Respondent's application for renewal of his license to practice medicine took place before the Board on December 17, 1987.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Prior to September 1986 Respondent was licensed to practice medicine in Maryland.

2. Respondent's license to practice medicine would have expired on or about October 31, 1986. On or about September 23, 1986, Respondent applied for renewal of his license to practice medicine in Maryland.

3. On the renewal application Respondent replied in the negative in response to the question: since your last registration, have you had any restrictions of hospital privileges based on disciplinary action despite the fact that Respondent's privileges at Maryland General Hospital were suspended in April 1986. Furthermore, by letter dated June 25, 1986 Respondent was advised that the Board of Directors of Maryland General Hospital had affirmed the Hospital's decision not to reappoint Respondent to the medical staff at Maryland General Hospital.

4. The Board finds that Respondent lied on his September 1986 application for renewal to practice medicine in Maryland.

5. Respondent alleges that subsequent to filing his renewal application with the Board, he forwarded an addendum license application on or about October 10, 1986 in which he admitted that he had lost privileges at Maryland General Hospital.

6. Nevertheless, the Board finds that on his renewal application Respondent failed to answer Question 5 truthfully and acknowledge that his privileges as a staff physician had been terminated.

7. The Board finds that the rationale provided by Respondent in his October 10, 1986 letter not credible.

NOW IS THE TIME TO MARKET YOUR PRACTICE.

Conclusions of Law

Based on the foregoing Findings of Fact, the Board concludes as a matter of law that Respondent, Richard P. Buyalos MD, lacks good moral character as required by Health Occupations, Section 14-305 Article of the *Annotated Code of Maryland* and DENIES Respondent's application for renewal of his license to practice medicine in Maryland.

Order

Upon the foregoing Findings of Fact and Conclusions of Law it is this 3rd day of March 1988 by a majority vote of the members of the Board considering this case:

ORDERED that Respondent's application for renewal of his license to practice medicine in Maryland is hereby DENIED.

ARTHUR T. KEEFE, JR., MD, Secretary
Board of Medical Examiners ■

Commentary

PRO Denials - Another Dilemma for American Medicine

During the past year, doctors have encountered an increasing number of hospital payment disallowances by the PRO acting for Medicare. In its desperate attempt to limit Medicare costs, HCFA has mandated PRO action to limit Medicare payments by denying payment for medically unnecessary medical services. Almost all doctors who treat hospitalized patients can give many egregious examples of such denials, many of which directly impact on the quality of medical care, as well as cases involving the intimidation of doctors by perceived threat of denial.

About a year ago, the PRO disallowed the entire hospitalization for a patient of mine. An elderly widow in her 80s, living alone, she was admitted to the hospital by ambulance because of severe pain in her right hip and inability to sit, stand, or walk. In the Emergency Room, x-rays of the hip were negative and because of the probability that her pain was due to radiculopathy, the Emergency Physician requested that I admit her to my service, to which I agreed. She had no neurological deficit and was treated with bed rest, physical therapy, and appropriate analgesic medication. She recovered well and was able to walk out of the hospital in about a week. Months later, Medicare payment was denied to the hospital because of the lack of acute care services. If I had done a myelogram, and certainly if I had operated on her, the hospitalization presumably would have been allowed, but since she recovered with only simple measures, her hospitalization does not satisfy Medicare criteria for payment. The PRO position was that this hospitalization was more for social problem than for medical treatment, and that the patient could have been managed by care at home instead of the hospital. The fact there was no care available to her at home did not impress the PRO sufficiently to pay her hospital bill.

Does this mean that the next time I see a similar patient I should have her carried into a cab and transported home with prescription for pain medicine and instructions for complete bed rest? Or does it mean that the next time I see a similar patient I should proceed promptly with myelography and surgery to insure hospital payment?

Recently I had contact with another troublesome example of patient management: a case where the doctor was intimidated into providing less than optimal care because of the threat of payment disallowance. The patient was a 75-year-old lady who had received a diagnosis of inoperable malignancy made about a year prior. She was treated appropriately and successfully, and she handled the diagnosis and prognosis quite well. She remained optimistic with great trust and affection for her doctor. She then developed ascites. By the time she saw her doctor, about two weeks after onset, her abdomen was markedly protuberant, and she had moderate abdominal discomfort. Instead of prompt hospitalization for studies and paracentesis, she was treated as an outpatient. During the ensuing 10 days or so, while she was receiving various x-ray studies and scans, her condition rapidly degenerated. Her abdomen became grotesquely protuberant, and she developed severe nausea and total anorexia. She had to go back and forth for various diagnostic studies, wearing only a bathrobe covering her protuberant abdomen, since she had no clothes that would fit. Her family tried to buy her new clothes, but could find nothing to fit her except a maternity dress this for a woman who had always been extremely fastidious in dress and appearance and who had never been pregnant. By the time the studies were completed, her morale was shattered and her confidence in her medical care erased. When the paracentesis was finally done, also on an outpatient basis, it was thought safe to remove not more than 2 liters of fluid, which hardly reduced her abdominal distention significantly.

Unquestionably the care provided on an outpatient basis was medically adequate, but much suffering and loss of dignity and hope could have been avoided by prompt management in the hospital setting.

For years, doctors have been exhorted to treat the whole person not simply the disease. The proper philosophy of modern medical care is not merely technical aspects but also the humanistic foundation underlying the technical component. Payment now is being limited to the technical component only.

The PRO, and the federal government for which they act, must recognize that doctors do not treat disease, they treat patients. Doctors cannot and will not be intimidated into providing less care than the patient needs and should have. We must continue to do what is best for the patient, not just what the government will pay for. The PRO must acknowledge its commitment to quality of care as well as to cost problems.

The best solution to this problem would be for the federal government to acknowledge that no one is in a better position to determine what is medically necessary than the treating doctor. Undoubtedly, there will be some small percentage of unnecessary utilization, but this is not an excessive price to pay for maximizing quality of care. If the federal government believes it is absolutely imperative to monitor utilization, it should be done in a real time frame, not retrospectively. The process of retrospective review and disallowance should be replaced by a program of concurrent monitoring and pre-admission authorization, so that the patient at least will have the choice of paying for medically recommended services that the PRO might feel are not medically necessary. This process also

would increase the PRO accountability to the citizen, which the present system neatly bypasses.

In addition, we must feel a little sympathy for the PRO physicians, who must be getting increasingly frustrated by their inability to achieve manifestly impossibly goals and to function in a system whose primary purpose is on the one hand to insure quality medical care and on the other hand to limit physicians' ability to provide quality care.

PRO Update

The Medical and Chirurgical Faculty Peer Review Organization (PRO) Monitoring Committee reviews the activities of the federally designated Peer Review Organization and is a liaison between the PRO and Med Chi. The current PRO is the Delmarva Foundation for Medical Care, Inc. (DFMC). Many physicians have expressed concerns regarding PRO actions and communication problems.
To help Maryland physicians better understand the federally regulated PRO requirements and how the review-denial-appeals process works, the Maryland Medical Journal
in cooperation with Delmarva will publish several articles in an attempt to define and clarify these issues, often by using case examples to illustrate general topics.
Data collected by DFMC of interest to Maryland physicians will be presented as well as comments from physicians regarding the impact of these regulations on the quality of care delivered to patients.

JOHN A. SINGER MD, Chairman
Medical and Chirurgical Faculty
Peer Review Organization Monitoring Committee

■ ■ ■

Background of the PRO Program

In 1982 the Utilization and Quality Control Peer Review Organization (PRO) program was created by Congress by the Peer Review Improvement Act to succeed PSROs (Professional Standards Review Organizations) in providing Medicare peer review. The PSRO program had been established by Congress in 1972 to ensure that health care services provided under the Medicare, the Medicaid, and the Maternal and Child Health and Crippled Children's programs were medically necessary, conformed to appropriate professional standards, and were delivered in the most efficient and economical manner possible. The PSRO program was a response to increasing Medicare and Medicaid costs and to the failure of existing utilization and claims review mechanisms to deal with widespread inappropriate use of health care services.

The congressional rationale for replacing the PSRO program with the PRO concept in 1982 was based on the perception that the PSRO program had been subject to overregulation and too detailed specification in laws that restricted new approaches to the review process.

The PRO legislation emphasized greater accountability by requiring PROs to have performance-based contracts with measurable objectives. It also addressed concerns about quality: whether the potential negative incentives of the prospective payment system (PPS) might lead to an increase in hospitalizations and a reduction in the quality of care provided to Medicare beneficiaries. (Compared with former cost-reimbursement systems, PPS gave hospitals much stronger incentives to increase Medicare payments by increasing their number of admissions and to reduce costs by limiting services or discharging patients earlier.)* The PROs were charged with monitoring the system to protect against potential provider abuses such as unnecessary admissions, substandard care, and premature discharges.

Physician Involvement

In authorizing the Secretary of the Department of Health and Human Services to enter into contracts with PROs, Congress specified that such organizations must be composed of or have available to them a substantial number of licensed physicians who are practicing in the area.

An Evolving Process

The first Scope of Work, which described the review responsibilities for PROs from 1984 to 1986, was centered on concerns that the newly implemented PPS would encourage inappropriate utilization and underprovision of services. (Although Maryland is waived from the PPS, its Scope of Work closely reflects that of the other states.)

There was a significant shift from utilization and payment concerns to quality review in the second PRO contract period. The Health Care Financing Administration (HCFA) developed generic screens to be applied to the sample of cases reviewed; the goal was to identify adverse patient outcomes that may have been indicators of substandard care. Then, as now, every case in the selected sample underwent discharge review to screen for possible premature discharge. All readmissions occurring within 15 days of discharge were also subject to review. A Beneficiary Outreach Program was a required part of the second contract. Each PRO had to develop ways in which the Medicare beneficiaries could be informed about items such as PRO review and the beneficiaries' right to appeal a denial decision.

Several new responsibilities were added after the second contract was awarded in the fall of 1986, includ-

*In Maryland the PPS is not being used. This is the only state that has maintained a waiver, largely through the efforts of its Health Services Cost Review Commission (HSCRC), established in 1974. The Commission establishes all allowable hospital rates by application of its uniform accounting system and by routine auditing of hospital costs; to date it has demonstrated that rates can be contained by this means. Although PRO responsibilities in Maryland are similar to those in other states, some modifications have been made in light of our waiver status.

ing a review of the necessity of assistant surgeons at cataract surgery, review of freestanding cardiac catheterization facilities, investigating beneficiary complaints, and reviewing care provided to HMO risk enrollees. In addition, time frames for the attending physician to discuss a case or supply additional information were extended by Congress to 20 calendar days.

In April 1989 the PRO was required to start implementing the third change in the Scope of PRO monitoring of Medicare services in Maryland. The newest Scope of Work (1989-92) continues the emphasis on quality, expands PRO responsibility to review care outside the hospital setting, and requires a significant increase in the amount of profiles and statistical information generated by the PRO.

Systematic review of ambulatory surgery for Medicare beneficiaries, done in either hospital outpatient departments or ambulatory surgery centers, is included in the Third Scope of Work. Review of intervening care [provided by skilled nursing facilities (SNFs), outpatient departments (OPDs), or Home Health Agencies (HHAs)] also has been added.

Review in these new areas is done to identify problems in the quality of care provided. The original set of generic screens used to review inpatient care is being supplemented by generic screens for SNFs, OPDs, and HHAs.

In addition to the responsibilitites of the Outreach program, each PRO must also have an Interaction Plan that provides educational activities for physicians and hospital administrative staff.

A Continuing Dilemma

Federal responsibilities have not and do not provide for all aspects of health care for the elderly. For instance, the responsibilities for nursing home care and home health care have never been fully assumed by the federal government; often state and local governments have not assumed these responsibilities. Therefore, a continuing frustration for everyone is the mandated denial of payment for services where it is obvious that the service is needed, but neither the federal government nor the community is willing or able to provide it.

Delmarva Foundation

The Delmarva Foundation for Medical Care, Inc. (DFMC) is a private, nonprofit organization incorporated in 1973 and governed by a 13-member Board of Trustees (11 physicians and 2 consumer representatives).

When the federal government began the campaign to institute external physician review organizations nationwide and requirements for Professional Standards Review Organizations (PSROs) were included in the Social Security Amendments of 1972, the Maryland Eastern Shore was designated a PSRO area. The Foundation was among those included in the first wave of federal planning grants for PSROs in 1974. DFMC remained a viable PSRO through 1984 despite several budget cuts and program changes.

In 1982, the DFMC became the first such group to organize a multi-PSRO state into a statewide joint venture. To carry out the Maryland Medical Assistance Contract, the DFMC brought together diverse review groups combined with direct performance in some areas and management assistance in others, to produce a uniform system for reviewing Medical Assistance hospital and nursing home stays in the entire state of Maryland. In 1984, the DFMC was awarded the statewide contract for review of Medical Assistance patients as the sole contractor and has since continued to maintain the role of Utilization Control Agent for the state Medicaid program. The contract was again awarded to DFMC for a three-year period from July 1987 through June 1990.

With the Peer Review Improvement Act of 1982 and the Medicare Prospective Payment System Amendments of 1983, DFMC joined the ranks of past PSROs who bid for federal contracts as Utilization and Quality Control Peer Review Organizations (PROs). In 1984, the DFMC obtained the PRO contract for the District of Columbia. In 1986, the DFMC was named the PRO for both the District of Columbia and Maryland. The PRO contract to perform the Third Scope of Work has recently been awarded for a three-year period 1989 - 1992.

As the Maryland PRO, one of the initial steps taken was to establish a Criteria Review Panel comprised of physicians representing relevant specialties and geographical locations statewide, and serving the DFMC in an advisory capacity to the Board of Trustees. The main responsibilities of the Panel include making recommendations for review criteria, review procedures, and administrative policies.

A Statewide Quality Panel, composed of board-certified specialists, has been added under the newly awarded contract. The panel membership changes on a monthly basis with the specialties represented reflecting the types of specific physicians and providers to be reviewed. The Quality Panel's major responsibility is to review information about specific physicians and providers with identified patterns of quality problems. In such cases, the Panel has the responsibility to recommend educational interventions.

June 8	*Concurrent scientific symposia start at 8:30 a.m. with presentations on Women and Medicine; Information and Communication in Health Care; Education and Research; and Genes and Medicine. Symposia resume at 2 p.m. with lectures on The Heart; Diagnosis and Treatment of the Unborn; Diagnostic Imaging; and Health in the Year 2000.*
June 9	*Symposia featuring the Nursing Professions: Limited Resources, Multiple Needs; Public Health: An Ounce of Prevention. Lectures resume at 2 p.m. with Mind Brain Science and AIDS; a half-day symposium on Medicine, The Humanities, and the Arts.*
June 10	*Departmental open houses and reunion programs for Hopkins medical, public health, and nursing alumni.*

All courses at the Turner Auditorium unless otherwise indicated. Sponsored Continued Education Activities for 1989. Info: Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Baltimore, MD 21205 (301-955-5880).

June 5-6 **Frontiers in Disease Prevention: A Conference on the Impact of the US Preventive Services Task Force Guidelines**. Fee: $225 health professionals, $75 residents and students; 14.75 AMA Cat I credits. Info: 301-955-2959.

June 5-16 **Second Summer Institute in Environmental Health Studies**, sponsored by the Department of Environmental Health Sciences and the School of Hygiene and Public Health. Courses: Principles of Toxicology, Risk Communication of Environmental Hazards, Fundamentals of Occupational Medicine, Contemporary Problems in Radiation Health Sciences, Introduction to Risk Assessment and Risk Management, A Computer Model of the Cardiovascular and Pulmonary Systems Capability to Handle Toxic Problems of the Environment and/or Disease. Info: J. Corn 301-955-2609.

June 11-15 **VII ISIAN: International Symposium on Infection and Allergy of the Nose - Interational Rhinology Conference**, Stouffer Harborplace Hotel, Baltimore. Fee: $475 physicians, $350 residents & fellows; AMA Cat I credit will be available. Info: Congress Secretariat 301-955-2959.

June 14-17 **Baltimore Perinatal Colloquium**. Fee: physicians $375, residents $200; 23.5 AMA Cat I credits, ACOG cognates available. Info: J. Ryan 301-955-2959.

June 19 **Principal Aspects of Ambulatory Electrocardiographic Monitoring for Myocardial Ischemia**. Fee: TBA; 7 AMA Cat I credits. Info: 301-955-2959.

June 30 **The Retinal Vascular Center 19th Anniversary Meeting Macula**, The Wilmer Ophthalmological Institute. Fee: $200, $100 (those in training); 8 AMA Cat I credits. Info: D. Heydinger 301-955-2959.

July 17-21 **Control of Biohazards in the Research Laboratory**. Info: B.S. Tepper 301-955-5918 or J. Corn 301-955-2609.

Sept 11-13 **1989 Interventional Neuroradiology**. Fee: $550 physicians, $350 residents, fellows (with verifying letter), and technicians; 26.5 AMA Cat I credits. Info: F. Boling 301-955-2959.

Oct 11-12 **Vernon B. Mountcastle Symposium - Neuroscience: Integrative Functions**. Fee: $50; 12 AMA Cat I credits. Info: 301-955-2959.

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

DOCS TAKE NOTE DOCS TAKE NOTE DOCS TAKE NOTE DOCS TAKE NOTE

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

Basic Practicum in Diagnostic Ultrasound: Aug 7-11, Nov 6-10. Fee: $500; 40 AMA Cat I credits.

Advanced Practicum in Diagnostic Ultrasound: Dec 4-8. Fee: $500; 40 AMA Cat I credits.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500; 40 AMA CAt I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169. ■

MEMBERS IN THE NEWS MEMBERS IN THE NEWS MEMBERS IN THE NEWS

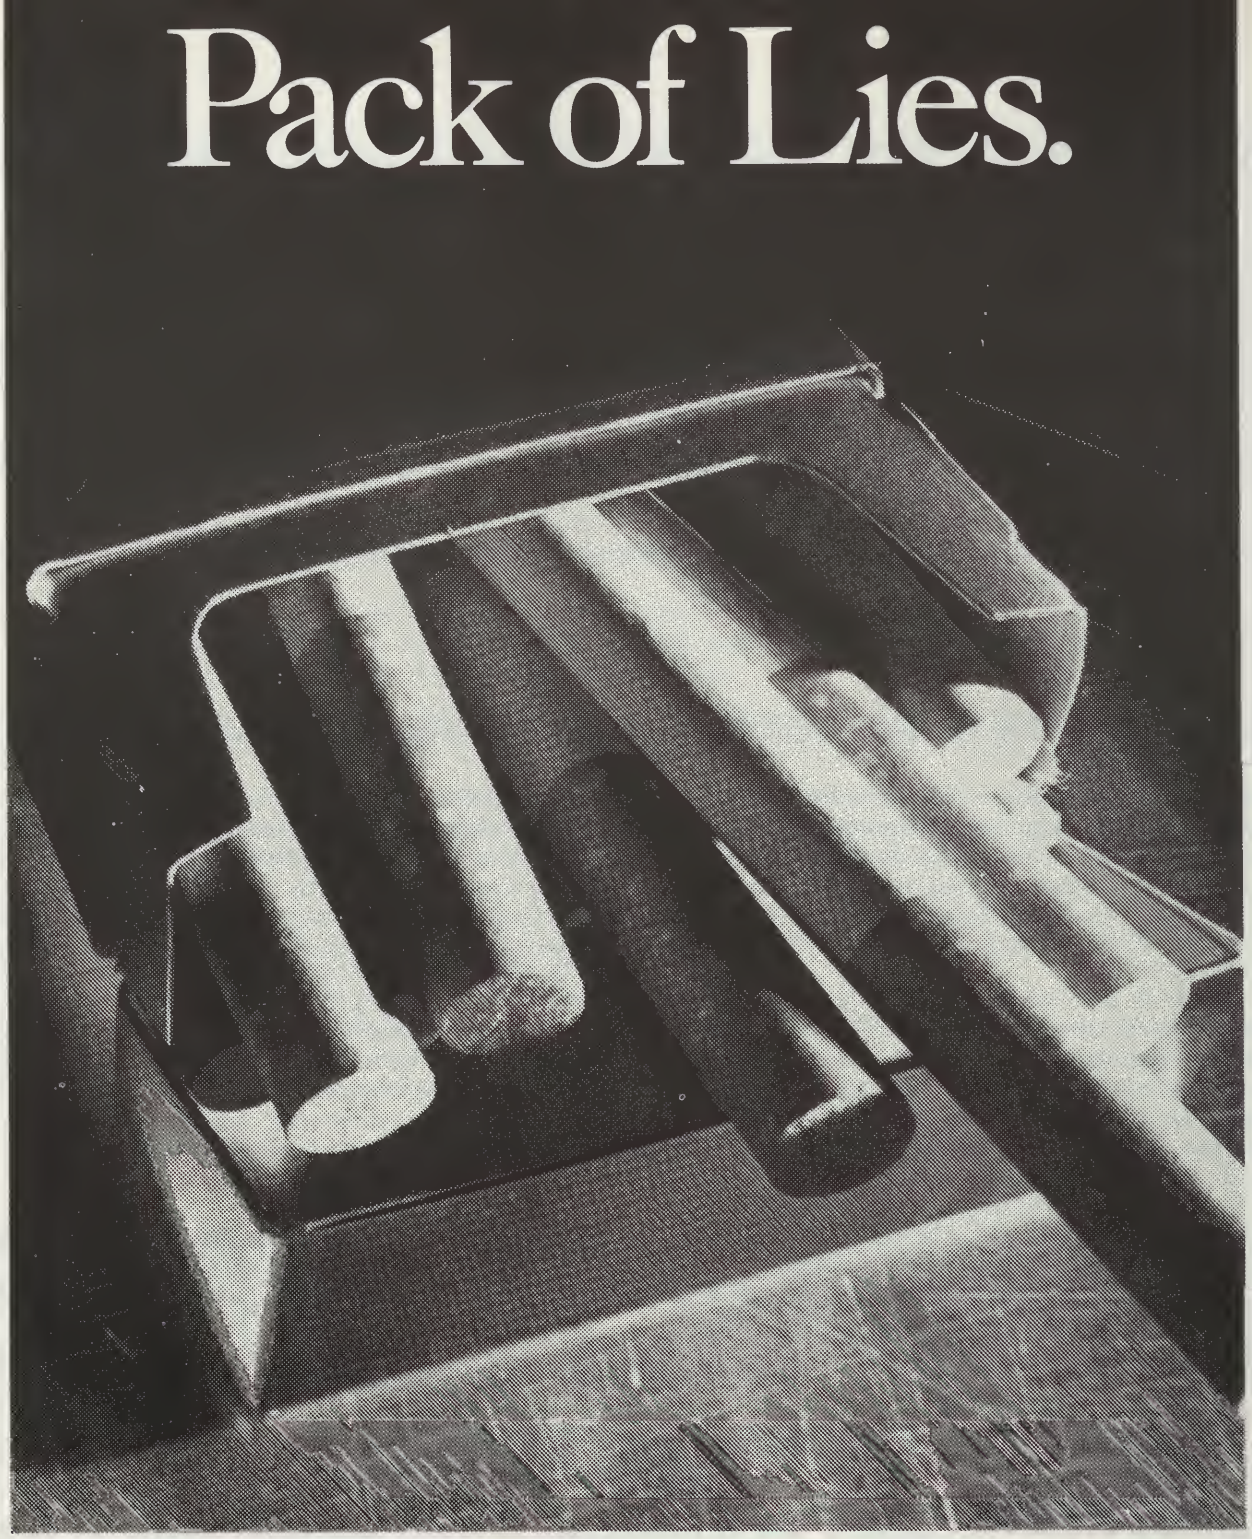
Rose Mary Hatem Bonsack MD, Aberdeen, recently was appointed Secretary to the Board of Physicians Quality Assurance. A cum laude chemistry graduate of Washington College in Chestertown, Dr. Bonsack received her MD from the Medical College of Pennsylvania and served a rotating internship in the Easton Hospital, Easton, PA.

Dr. Bonsack also was recently appointed to the Chapter Affairs Committee of the American Academy of Family Physicians (1989). Other members of the Maryland Academy of Family Physicians appointed to committees of the American Academy of Family Physicians are *Dean H. Griffin MD*, Westminster, Scientific Program Committee (1989-1991); *C. Earl Hill MD*, Pasadena, Commission on Public Health and Scientific Affairs (1989-1991); *M. Dudley Phillips MD*, Darlington, Public Relations and Marketing Committee (1989); and *Leonard Raucher MD*, Baltimore, Commission of Legislation and Governmental Affairs (1989).

• • •

Immediate past-president of the Prince George's County Medical Society, *Bahram Erfan MD*, was appointed to head the Washington DC Metropolitan Area Medical Council for 1989. The Council is composed of representatives from each of the Metropolitan Area County Medical Societies, including the District of Columbia, and serves as a forum to deal with problems and issues concerning the provision of quality health care to the area's population.

Dr. Erfan invites members of the Society of submit issues that may be presented to the Council for consideration.



• • •

The 1989 officers for the St. Mary's County Medical Society are *David C. Allen MD*, President; *James C. Boyd MD*, Vice-President; and *Umed K. Shah MD*, Secretary. ■

Pack of Lies.

What are the three biggest lies in the world?
Smoking is relaxing. Smoking is glamorous. Lung cancer won't happen to me.
This year, 125,000 Americans learned the truth about smoking
when they were diagnosed with lung cancer.

EVERY QUITTER IS A WINNER.

AMERICAN CANCER SOCIETY

When your patients need your best health care recommendations use your head.

Staff Builders
HEALTH CARE SERVICES

Remember this hat.

When your patients need home health care remember to recommend Staff Builders. Our nurses (RN/LPN), therapists (physical/occupational/speech), medical social workers, nurses aides, home health/personal care aides, home-makers, live-in home companions are all carefully screened, bonded, insured and professional in every way. But more than that, they care. So remember Staff Builders when you recommend health care services. And remember most home health services are paid by Medicare, Medical Assistance, or Blue Cross. And that hospital and home private duty services are also available. Staff Builders personal and professional care is as close as your phone. Just give us a call if we can be of assistance.

Licensed by the State of Maryland and Federally Certified for Medicare/Medical Assistance/Blue Cross-Home Care.

Available every hour 7 days a week.

PRACTICE WANTED
Internist wishes to purchase active IM/FP in the Rockville/Bethesda area. Prepared to assume full responsibility by July 1989. Box 7 *MMJ*, 1211 Cathedral St., Baltimore, MD 21201.

BUSY PEDIATRIC PRACTICE
Office space to share in our satellite office located in Upper Marlboro. Newly decorated and fully equipped 301-292-2200.

INTERNIST WITH GERIATRICS EMPHASIS WANTED
Join busy practice in suburban Baltimore; affiliated with Hopkins-associated hosptial and multiple nursing home facilities. Salary, malpractice, and benefits. Send CV to PO Box 20, Stevenson, MD 21153.

WANTED: FAMILY PRACTITIONER/INTERNIST
Full-time MD needed to provide primary care to HMO patients. Salary, fringe benefits, malpractice, all office & staff expenses covered. The commitment anticipated is 2-3 years, after which assistance will be offered to establish private practice. Available immediately. Send CV to M. Timon, Mercy Primary Care Group, 102 E. Pleasant St., Baltimore, MD 21202.

GYNECOLOGIST WANTED: BC/BE
Highly committed for part-time position in well-established family planning center. Practice consists of gynecologic & pregnancy termination services as well as some administrative responsibilities. Competitive compensaion and benefits package. Direct inquiries & CV to Personnel Director, Planned Parenthood of Maryland, 610 N. Howard St., Baltimore, MD 21201.

PEDIATRIC PRACTICE FOR SALE
Marlow Heights, MD. Serving area for 3 decades at same address, 2 miles from beltway. All private patients. Practice includes rooms equipped for office and lab work; GE 200KV x-ray unit & dark room. Lease of premises and terms for sale negotiable 301-423-6262.

PEDIATRIC ASSOCIATE WANTED
Easton, MD. If interested call 301-822-7909.

KENT ISLAND MEDICAL OFFICE FOR LEASE
New building with four suites; three already rented. Ideal location. PO Box 250 Stevensville, MD 21666.

PROFESSIONAL OFFICE FOR RENT
Across from Catonsville Library 301-744-4849.

OFFICE SUITE FOR SUBLEASE
Offered by large multispecialty group in prime downtown location; fully furnished, free patient parking. Ideal referral system for GI, Surgery, Orthopedics, or Urology. 301-576-8220.

SUBLEASE NEW MEDICAL OFFICE
In rapidly growing Pasadena area. Prefer OB/GYN specialty. 301-255-2700.

FOR SALE: GASTROSCOPE
Olympus GIF-PQ20, never used, $10,200. Call 301-292-2300. ■

ENDING TAILS OF OWE

"My group was faced with a Claims Made tail payment which was about to jump to over $70,000. The Harjes Agency worked with Princeton Insurance Company to get us out of Claims Made and into *Occurrence Plus*. We saved over $30,000 and have no future tail to worry about."

Dr. Robert A. Murphy, Anesthesiologist
Mount Holly, New Jersey

Introducing *Occurrence Plus*
Medical Malpractice Insurance to Maryland Physicians

Princeton Insurance Company now offers a better choice of malpractice liability coverage, *Occurrence Plus*. Combining the best features of standard occurrence and claims made policies, *Occurrence Plus* eliminates the need for a costly tail. In fact, no other company offers malpractice insurance with all the benefits of *Occurrence Plus*.

LEARN HOW YOU CAN ESCAPE THE COSTLY CLAIMS MADE TRAP.

Discover the advantages of *Occurrence Plus* by calling Denise Dortch at 301-785-6161. The Harjes Agency, through years of experience with Princeton Insurance Company, can show you how to convert to *Occurrence Plus* smoothly, without a lapse of coverage.

DELIVERING REAL CHOICES TO MARYLAND PHYSICIANS

VASOTEC®
(ENALAPRIL MALEATE | MSD)

Contraindications: VASOTEC® (Enalapril Maleate, MSO) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the tace, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See AOVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Heart failure patients given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See OOSAGE ANO AOMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in heart failure patients), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and AOVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the tirst two weeks ot treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial intarction or cerebrovascular accident. It excessive hypotension occurs, the patient should be placed in supine position and, it necessary, receive an intravenous infusion ot normal saline. A transient hypotensive response is not a contraindication to further doses ot VASOTEC, which usually can be given without ditticulty once the blood pressure has stabilized. It symptomatic hypotension develops, a dose reduction or discontinuation ot VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more trequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation ot enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the tirst tew weeks ot therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Oosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See OOSAGE ANO AOMINISTRATION.)

Hyperkalemia: Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause ot discontinuation ot therapy in 0.28% of hypertensive patients. In clinical trials in heart tailure, hyperkalemia was observed in 3.8% ot patients, but was not a cause for discontinuation.

Risk tactors tor the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, it at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. It hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the tirst dose ot enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling ot face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness especially during the tirst few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive tall in blood pressure because ot reduction in tluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, tever) which may be a sign ot neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the sate and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation ot treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision atter the initial dose tor at least two hours and until blood pressure has stabilized tor at least an additional hour. (See WARNINGS and OOSAGE ANO AOMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence ot clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Theretore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: A few cases ot lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation ot both drugs. Although a causal relationship has not been established, it is recommended that caution be exercised when lithium is used concomitantly with VASOTEC and serum lithium levels should be monitored frequently.

Pregnancy—Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average tetal weight, occurred in rats given 1200 mg/kg/day ot enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and tetal toxicity occurred in some rabbits at doses ot 1 mg/kg/day or more. Saline supplementation prevented the maternal and tetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies in pregnant women. VASOTEC® (Enalapril Maleate, MSO) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 298/ patients.

Hypertension: The most trequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

Heart Failure: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% ot patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial intarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order ot decreasing severity within each category:

Cardiovascular: Myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); cardiac arrest; pulmonary embolism and infarction; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis or cholestatic jaundice, melena, anorexia, dyspepsia, constipation, glossitis.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION), prostate hypertrophy.

Respiratory: Bronchospasm, rhinorrhea, asthma, upper respiratory infection.

Skin: Herpes zoster, pruritus, alopecia, flushing, photosensitivity.

Other: Muscle cramps, hyperhidrosis, impotence, blurred vision, taste alteration, tinnitus.

A symptom complex has been reported which may include fever, myalgia, and arthralgia; an elevated erythrocyte sedimentation rate may be present. Rash or other dermatologic manifestations may occur. These symptoms have disappeared after discontinuation ot therapy.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be tatal. If angioedema ot the tace, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause tor discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause tor discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation ot VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause tor discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g % and 1.0 vol %, respectively) occur frequently in either hypertension or heart tailure patients treated with VASOTEC but are rarely ot clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% ot patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases ot neutropenia, thrombocytopenia, and bone marrow depression have been reported.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, it possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance >30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤30 mL/min (serum creatinine ≥3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose ot VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized tor at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) It possible, the dose ot the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose ot VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management ot the hypotension. The usual therapeutic dosing range for the treatment of heart tailure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart tailure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day ot VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Oosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Heart Failure Patients with Renal Impairment or Hyponatremia: In heart tailure patients with hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See OOSAGE AND AOMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, it at the time ot dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

Made in Maryland.

Maryland. From the mountains and valleys of Western Maryland, to the excitement of the cities, to the quiet waters of the Eastern Shore, Maryland is home. Your life and your practice are here. You give the medical care that so many depend on for their quality of life.

Your patients depend on you, and you depend on us—to give you strong, reliable protection, to give you the options you need, and to stand with you if a suit is filed. We protect your practice, so you can be free to concentrate on your patients.

Medical Mutual was created in 1975 to meet the special needs of Maryland physicians, and our commitment continues today. Our company is owned by Maryland physicians, our offices and people are here, and our programs are directed by the long-term needs of our Maryland members.

We are proud to serve the thousands of Maryland physicians who depend on us for their professional liability insurance. Together, we are working to enhance the quality of health care across our state.

Medical Mutual Liability Insurance Society of Maryland. It's our home, too.

Treat your practice with the same care you give your patients.

With billing getting more complicated every day, more physicians are depending on computers to streamline the billing process and maintain cashflow. But without strong customer support, computers can aggravate problems instead of solving them.

That's why you need Sentient—a solid local company offering an excellent computer system with effective long-term support. Each Sentient system comes with the training, software and the ongoing support you'll need to adapt to the latest changes in carrier and regulatory requirements. We're always there for you with new enhancements, advice, and to answer questions. For a free consultation call Sentient today.

A Choice.

Just what the doctors ordered.

What's right for a colleague is not necessarily right for you. That's why Princeton Insurance Company now offers three options to let you build an insurance program tailored to your individual needs:

- Our exclusive *Occurrence Plus* -- the best coverage available from any company.
- Our new *Claims Made Advantage* --- a cost effective way to make the transition to *Occurrence Plus.*
- *Claims Made* -- the lowest cost coverage available today.

The *Claims Made Advantage* and *Claims Made* options let you transfer from another insurer's claims made policy into Princeton's programs without a "tail" or "prior acts" charge.

To find out more about these choices, call one of the independent insurance agents who represent Princeton.

Could Your Malpractice Insurer Become Insolvent?

> Concern is mounting among public officials and analysts that a financial crisis is brewing in the insurance industry.
>
> * * *
>
> . . . there have been an average of 18 insurance failures in each of the last four years. . .
>
> *New York Times, April 15, 1989, Front Page*

Insurance companies do not have to be small to fail. Two insurance company insolvencies in 1987 accounted for failures of $1.3 billion. Many Maryland physicians are already experiencing the fear of going "bare" due to the insolvency of Mutual Fire.

The issues are complex. They concern determinations of adequate reserves for future claims, and proper underwriting and defense, among other issues. An OB GYN can be sued up to 21 years from the date of a childbirth for an alleged incident. The doctor may or may not be practicing at that time. If inadequate reserves are maintained, the same may be true of the insurer. Can you make the necessary evaluations? Do you know what questions to ask?

We are sure you have heard the maxim, "Where there is smoke there is fire." Competition among Maryland malpractice insurers has stirred up plenty of smoke. Do not count on the contentions of the companies alone for answers.

You need a broker you can rely on

As an independent broker with direct writing authority, Contemporary Insurance Services can advise you concerning all available carriers. *If you have recently switched carriers and are having second thoughts, call on us for an evaluation of your situation.* We are one of the largest agencies for the sale of malpractice insurance to Maryland physicians. Do not wait until your policy is up for renewal. Return the form below or call us for an evaluation of your policy.

JULY 1989

Selected Communicable Diseases in Maryland in 1988

The following report describes briefly the epidemiology of selected reported communicable diseases in 1988 in Maryland. For many diseases, additional data were collected through active morbidity, mortality, and laboratory surveillance.

All reported diseases and conditions are summarized by county in two tables at the end of this report.

The number in parenthesis after the name of each disease indicates the reported cases with onset of illness in 1988. Following, is the incidence rate in Maryland, and then the U.S. rate, based on the cumulative number of cases reported to the MMWR System in 1988 (CDC. MMWR 1989, 37:51&52) and the U.S. Bureau of Census, population estimate on July 1, 1988.

BOTULISM (2)
0.04/100,000 (U.S. - 0.03/100,000)

One botulism type A case involved a three month old infant. The source of infection was not identified. A foodborne case in an 18 year old male with classical symptoms, was caused by homemade tomato sauce and beef meatballs kept for one week without refrigeration, before consumption. Type A botulinal toxin was found in the patient's blood serum and in the sauce and meatball specimen.

CHOLERA (1)
0.02/100,000 (U.S. - 0.03/100,000)

The diagnosis was confirmed by culturing Vibrio cholerae serovar 01, serotype Inaba, from feces. The suspected source of infection was oysters consumed at a restaurant, three days before the onset of symptoms.

ENCEPHALITIS (18)
0.4/100,000 (U.S. - 0.4/100,000)

Nine (50%) cases occurred in the first quarter of the year, with highest incidence in Harford County (3.0 per 100,000). The male:female ratio was 1:0.9. All patients were white with the exception of one black male and one black female. The age ranged between 1 and 86 years (median 37, mean 45.5 years). Herpes viruses caused 5 of the cases, M. tuberculosis - 1, Epstein-Barr virus - 1, and the rest were of unknown etiology. Three (16.7%) patients died; the rest recovered.

GONORRHEA (20,982)
458.1/100,000 (U.S. - 285.5/100,000)

Gonorrhea decreased by 14% in 1988 compared to 1987. At the same time, penicillinase-producing Neisseria gonorrhoeae (PPNG) increased by more than 300%. In addition, tetracycline resistance was up to 15% in gonococcal isolates from Baltimore City and Prince George's County, where sensitivity tests are performed on a periodic sample. The Division of Sexually Transmitted Diseases Control, therefore, reiterates that tetracycline alone should NOT be used as an alternative to the accepted treatment regimens. Antibiotic resistance testing must be considered when treating suspected or confirmed cases.

HAEMOPHILUS INFLUENZAE INFECTIONS (122)
2.7/100,000 (U.S. - Not available)

The incidence of H. influenzae type b disease remained unchanged from 1987. Currently, in Maryland, only H. influenzae meningitis is reportable by law (which we expect to change by the end of 1989 when all invasive H. influenzae infections will be included in the list of reportable conditions). Nevertheless, in addition to the 85 meningitis cases, reports were received on 19 primary bacteremia, 5 pneumonia, 3 conjunctivitis, 3 epiglottitis, 2 buccal infections, 1 osteomyelitis, 1 otitis media, 1 rhinitis, 1 tracheitis, and 1 periorbital infection. The distribution by type of illness is presented on Figure 1.

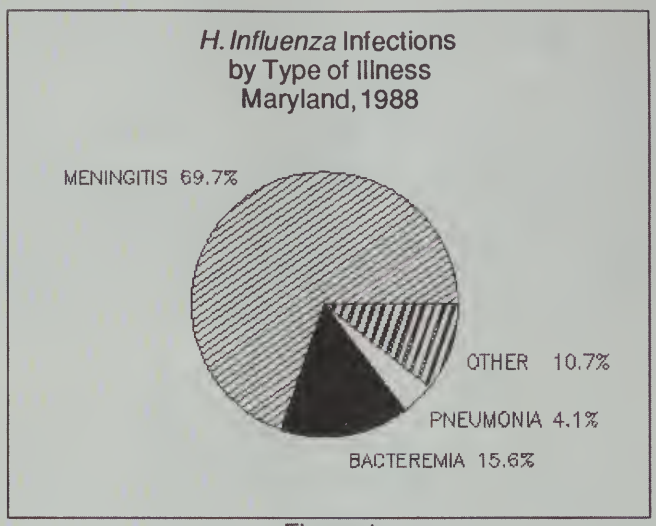

Figure 1

H. influenzae disease was least likely to occur in the summer; only 16.4% were reported in July through September. The male to female ratio was 1.1:1. Almost 31% of the females and 38% of the males were black, indicating disproportionately higher incidence among blacks. Seventy-five (61.5%) of the cases were less than 18 months of age, including 5 newborns, and 4 were adult cases 65 to 74 years of age. Thirty-six patients were eligible for vaccination (18 months to 5 years of age). Of these, 8 (22.2%) had been vaccinated before the onset of illness, 12 (33.3%) had not been vaccinated and 16 (44.4%) had an unknown vaccination status. H. influenzae ampicillin resistance dropped slightly to 42.1% (Table 1). Four patients with meningitis and 1 with epiglottitis died, 87 survived, the outcome of the rest (30) is not known.

To be continued in the August issue of the Newsletter.

The Personality Disorder Treatment Program of Sheppard Pratt Hospital.

You know—perhaps firsthand—how treating a borderline patient can become a vicious circle. The harder you try to help, the more resistant, or even abusive your patient becomes, until both of you are left frustrated and exhausted.

But how do you break the therapeutic deadlock? Changing therapists may only begin the cycle all over again. And a brief hospital stay usually produces only temporary improvement.

At Sheppard Pratt, our experience has shown that specialized inpatient treatment, coupled with the opportunity for a longer hospital stay, may be the only effective way to interrupt this pattern of behavior and uncover and resolve the deep-seated problems underlying the patient's longstanding difficulties.

The Personality Disorder Treatment Program at Sheppard Pratt is designed to provide such long-term care. Our objective is to bring about lasting improvement in patients with personality disorders.

The process is not easy. Serious personality disorders do not lend themselves to a "quick fix." But we are encouraged by the number of our patients who have, in time, broken out of the vicious circle.

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Admissions Office at (301) 938-3800 or toll free 1-800-627-0330, The Sheppard and Enoch Pratt Hospital, 6501 North Charles Street, P.O. Box 6815, Baltimore, MD 21285-6815.

Preservation in the History of Medicine Collection

The ancients so revered knowledge that the scroll or tablet on which the laws were etched were often as sacred as life itself, perhaps even moreso. Today that feeling still persists. Who hasn't dreamed of writingthe great American novel and thus beating death by insuring literary immortality? Sadly, even books are mortal. Between 1850 and 1960 with the increased use of wood pulp in papermaking the lifespan of a book was diminished. Now many libraries are faced with books too brittle to use.

An important aspect of any librarian's job is ensuring the longevity of the collection that he or she is responsible for. Today that responsibility includes making decisions regarding preservation. While Med Chi's History of Medicine Collection is in good shape there are still efforts that need to be made. The Staff of the Library, along with the Library and History Committee, are taking many of these steps to insure that the extensive collection gathered by Med Chi over the years will remain for future generations to use.

Preservation

One step that we are testing and reviewing is the possible deacidification of sections of the book collection. This process involves selecting titles that need attention, sending these items to a conservation facility where the books will receive a gaseous infusion of paraleyne. Once completed it is hoped that many of the now-brittle items in the Collection will be able to withstand limited use. This clear paraleyne coating will not alter the physical appearance of the item but will arrest the chemical breakdown of the paper fibers that contribute to brittleness.

Another simple step that can go a long way to improving the condition of the book collection is cleaning the stacks area. Accumulated dust and dirt can encourage the growth of airborne molds and attracts insects. This summer the staff of the History of Medicine Collection will undertake a housecleaning program of dusting, vacuuming, and replacing metal book ends in our efforts to preserve the collection.

The History of Medicine Collection recently received a ledger that belonged to Med Chi founder Francis Brown Sappington. The gift from Dr. Samuel Chase of Frederick came to him through Mary Angell Sappington, a descendant of Francis. The book contains an alphabetical list of patients visited and the dates, treatments prescribed, and the costs charged. In addition, several notes at the back testify to Dr. Sappington's honesty and accuracy in preparing his bills.

The archives and manuscript materials also are receiving attention. Currently this involves replacing highly acidic office file folders with pH-neutral file folders, surface cleaning as needed, boxing all items, and storing flat as required.

Artifacts

Along with paper items Med Chi also possesses a number of fine medical artifacts. In order to preserve this material we will undertake an effort to place the instruments in plastic bags, relabel them, and then store the instruments in acid-free map boxes. You might wonder if storing the artifacts in plastic is harmful. The answer is no. Plastic bags (such as ziploc sandwich bags) provide a stable microenvironment that allows researchers to study the instrument without direct contact with the item. This helps avert the problems of mechanical damage and the buildup of skin oils on the artifact. Many archaeological collections, including the Baltimore Center for Urban Archaeology, use this method for their research collections.

Art Works

The fine art pieces, which are an exciting part of the History of Medicine Collection, have been reviewed by

The History of Medicine Collection has instituted the following policies for using rare book, monographs, and archival material. By asking our researchers to follow these simple guidelines, we can ensure that the Faculty's material will receive proper care when in use.

- Never remove a book from the shelf by the top as this can pull the spine away from the text block (the pages), causing the binding and pages to sag.
- NO food or drinks should be brought into the reading room when rare or unique materials are in use.
- Only pencils and a notepad are allowed to be used with the History of Medicine Materials. Remember ink stains!
- Coats, briefcases, bookbags, cameras, hand-held photocopiers must be left in the History of Medicine Collection Office.
- Photocopies are available only upon the approval of the Archivist.
- When taking notes please do not lean, write on, or place items on the requested material.
- Under no circumstances will the researcher publish any part of the requested material without the explicit written approval of the Archivist.

several art restoration firms and are scheduled for at least one more review. After that we will begin to look at the cost estimates and decide how we will approach the needs of this special group of materials.

One method under consideration for the oil portraits is the application of a layer of hot wax to the back of the canvas. This method loosens dirt and accumulated varnish (the latter is what gives many older oil paintings a yellow tinge) without harming the image. Once completed the restorer can direct attention to any overpainting, tears, and frame repairs.

Preserving a collection as important as ours is a long process but certainly one worth the effort. It is only through the printed word and the preservation of that word that mankind can approach something akin to immortality.

The History of Medicine Collection has a small collection of preservation literature if you are interested in reading more about library or museum practices. Please feel free to stop by the History of Medicine Collection on the second floor or call 301-539-0872.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

1 Out Of Every 4 Medic Computer Systems Is Bought To Replace Another System.

Here's Why.

Too many practices find out about weak support too late. The smallest glitch takes hours of searching for help that never comes. The distributor went out of business. The software people say it's the hardware. And the hardware people don't answer the phone.

With Medic, that can't ever happen. Since we are the system developers, we can provide all the hardware and software expertise you'll need.

We start by assessing your practice's current needs and even the space you've got for computer stations. Then we follow through, with everything from helping you custom design your bills to seminars on getting the maximum benefit from your system.

That's the security Medic provides to more than 6,000 doctors in 2,000 practices from coast to coast. And it's backed by a $2.5 billion organization. Plus Texas Instruments hardware, with its excellent track record for reliability and expandability.

For a system you can start with and stay with, call Medic. Specialists in computer systems for America's medical community.

Executive Director's Newsletter

July 1989

Mutual Fire Inland and Marine Malpractice Insurance

On January 31, 1989, Mutual Fire, as a result of its insolvency, filed a revised plan of rehabilitation with the Commonwealth Court of Pennsylvania. In part, the rehabilitation plan provides for the payment of policyholder claims that exceed $5,000 on a proportional basis from the assets of Mutual Fire. In the June issue of this newsletter, it was inadvertently stated that the law firm of Spiegel & McDiarmid "have been retained by Mutual Fire to provide policyholders with information about the company." Mutual Fire has not retained the law firm. Spiegel & McDiarmid were appointed by the Commonwealth Court of Pennsylvania to represent the Policyholder Committee. The law firm has filed with the Court a statement in support of the rehabilitation plan and a request for modifications. Spiegel & McDiarmid is able to respond only to policyholder's questions about Mutual Fire's rehabilitation plan.

PRO Activities

The Delmarva Foundation for Medical Care (DFMC), as the federally designated Professional Review Organization, has begun to implement federal contractual requirements effective April 1, 1989. Following is a brief description of the Preadmission/Preprocedure Review Requirements and Quality Review Requirements.

Preadmission/Preprocedure Review Requirements One major change by DFMC for PRO review in the Third Scope of Work is the preadmission/preprocedure review. This review requirement became law April 7, 1986 under Section 1164 of the Social Security Act. It became effective April 1, 1989 and is now being implemented across the country.

As mandated by the Health Care Financing Administration (HCFA), ten selected procedures are to be reviewed. Two procedures were required by HCFA, cataract extraction and carotid endarterectomy. The remaining eight procedures were selected by DFMC Surgery Subcommittee of the Maryland Criteria Panel based on the following criteria, established by the law:

1. The procedure generally can be postponed without undue risk to the patient.
2. The procedure is a high-volume procedure among Medicare patients or is a high-cost procedure.
3. The procedure has a comparatively high rate of non-confirmation upon examination by another qualified physician or there is substantial geographic variation.

The additional eight procedures selected are: cardiac catheterization, carpal tunnel release, coronary artery bypass with graft,

percutaneous transluminal coronary angioplasty, laminectomy, inguinal hernia repair, prostatectomy and pacemaker insertion. The review is to occur for these procedures, whether they are performed inpatient or outpatient. Procedures performed in physicians' offices do not require preprocedure review.

With the goal of preventing admission for procedures that can be safely performed on an outpatient basis and preventing medically unnecessary performance of procedures, this review assesses the appropriateness of the setting, the medical necessity for the admission and/or procedure, as well as the quality of the services provided.

When a physician determines that a Medicare patient requires one of the targeted procedures, a "Request for Preadmission/Preprocedure Review" must be referred to DFMC for approval for Medicare reimbursement. This request must be completed by the physician or hospital documenting the necessity of the procedure/admission. It can be mailed to DFMC or it can be sent via FAX machine to 301-822-1996.

Once the medical information is obtained, it will be screened against the DFMC criteria. If it fails the criteria, a local physician advisor will review the request, and the attending physician will be given opportunity to provide additional information. If the request is denied, the patient, physician, and hospital will be notified within three working days of the date of review with the specific reasons for the denial and the reconsideration and appeals rights. If the admission/procedure is approved, the physician will be sent notification of the review decision in 24 hours.

Review is required for all ten procedures, whether elective, urgent, or emergent. For urgent cases, DFMC will accept preadmission requests over the phone, or in the case of emergency surgery, the request should be mailed or FAXed the next working day. Normally, this review will be completed that day unless referral to physician advisor is indicated, in which case, the review will be completed in three working days.

Cases not identified by the provider (and therefore not subject to review) will be pended by the fiscal intermediary and referred to DFMC for review prior to payment. Any case in which the procedure was performed despite preprocedure review denial will be reviewed by DFMC retrospectively.

For additional information, contact Julie Crocker RN, MS at 341B North Aurora St., Easton MD 21601 (1-800-999-3362). A preadmission/preprocedure packet, which includes the criteria and a request form, is available on request from the DFMC.

Quality Review Requirements The Quality Review Process, as developed for the new PRO contract by DFMC (effective 4/1/89), is one component of the retrospective review process. Each case identified for PRO review is reviewed for quality. The process begins with the nurse reviewer who applies the generic quality screens as mandated by HCFA. When a screen is failed, the case is reviewed by a physician specialist, and the attending physician is provided the opportunity to discuss the case. It is very important that the attending physician respond to this request for additional information to assure that all factors in each case are considered.

If the physician specialist confirms a quality problem or if no additional information is presented, one of the following severity levels is assigned and the weighted score noted.

Weight 1-Level 1-
Medical mismanagement *without the potential* for significant adverse effects on the patient.

Weight 5-Level 2-
Medical mismanagement *with the potential* for significant adverse effects on the patient.

Weight 25-Level 3-
Medical mismanagement *with significant adverse effect* for the patient. A problem that is determined to be gross and flagrant may be classified as Level 2 or Level 3 problem.

"Significant adverse effect" is defined as:

1. Unnecessarily prolonged treatment, complications or requiring readmission; or
2. Patient management resulting in anatomical or physiological impairment, disability, or death.

"Gross and flagrant" is defined as: A violation of an obligation that has occurred in one or more instances and that presents an imminent danger to the health, safety, or well-being of a Medicare beneficiary or unnecessarily places the beneficiary in a high-risk situation where substantial and permanent harm may occur.

In some instances, if the nurse reviewer identifies a potential Level 1 quality concern, the case is not considered a "problem." It is pended and only referred to the physician specialist for review if a pattern has developed. A "pattern" is defined as three Level 1 cases in a calendar quarter or five Level 1 cases in a bi-quarter. These screens include:

- Adequacy of discharge planning
- Nosocomial infection
- Fall
- Hospital acquired decubitus ulcer and/or deterioration of existing decubitus

Profiling will be conducted on a quarterly basis by practitioner/provider of all confirmed quality problems identified. The weighed severity level score will be computed. These data will be used to determine the need for both initiation and type of quality intervention to be used. These interventions are educational and include:

- Notification: All physicians are informed when a confirmed quality problem pattern is identified of Level 1 cases and/or a weighted severity score of 10, 15, 20, or 25 has been reached.
- Educational efforts, may include:
  - Literature references
  - Telephone and/or in-person discussions
  - Continuing Medical Education courses
  - Self-education courses
  - Assignment of Specialist Consultation
- Intensified Review: To provide an indepth analysis of the Medicare inpatient practice, a 100 percent retrospective review or focused intensified review may be instituted for a minimum of a quarter.

Oversight of the intervention plan will be the responsibility of the Maryland Quality Panel, which is composed of board certified physician specialists. Participation at the monthly meeting of the panel will vary depending on the specialty of cases to be reviewed.

Practitioners/providers will be referred by the panel to the DFMC Board of Trustees for sanction consideration when a weighted score of 25 points is achieved in one quarter. Sanction consideration may be at any level and will not be based solely when a trigger threshold is reached. Sanction would be employed primarily when beneficiaries need immediate protection from substantial risk or when other methods of quality intervention were ineffective.

DFMC will evaluate the effectiveness of all interventions by reviewing the first 25 admissions processed in the second quarter following the intervention. The results of the monitoring will be the responsibility of the Maryland Quality Panel.

To inform Med Chi members of the significance of these activities, the Executive Committee has approved the concept of establishing a forum during Med Chi's Semiannual meeting in September with representatives of the Faculty's PRO Committee, interested physicians, and members of Delmarva PRO.

MARYLAND LAW REGARDING NOTICE OF PARTICIPATION IN THE MEDICARE PROGRAM

On July 1, 1985 a law was passed in Maryland requiring physicians to post a notice in their offices regarding their participation status in the Medicare program. It has been brought to our attention that some physicians are not complying with this law. Therefore, Med-Chi has developed the signs on the next 3 pages for your use. The appropriate sign should be detached and posted in your office.

The law, which is outlined in Section 14-705 of the Health Occupations Article of the Annotated Code of Maryland, states:

> If a physician is engaged in the private practice of medicine in this State, the physician shall display a notice written in English that is plainly visible to patients in the office of the physician concerning whether the physician:
> (1) Is a participating physician under the Medicare program and, therefore, accepts assignment for all Medicare claims;
> (2) Accepts Medicare assignment on a case-by-case basis; or
> (3) Does not accept Medicare assignment in any case.
>
> This requirement DOES NOT apply to a physician or group of physicians who:
> (1) Have exclusive contracts with a health maintenance organization;
> (2) Treat only the patients of the health maintenance organization; and
> (3) Agree to accept full assignment for covered services rendered.
>
> **A PERSON WHO VIOLATES ANY PROVISION OF THIS LAW IS GUILTY OF A MISDEMEANOR AND ON CONVICTION IS SUBJECT TO A FINE NOT TO EXCEED $5,000 OR IMPRISONMENT NOT EXCEEDING 5 YEARS OR BOTH.**

If you have any questions about this matter, contact the Med-Chi Government Relations Department at 539-0872 or 1-800-492-1056.

For My Medicare Patients

I PARTICIPATE IN THE MEDICARE PROGRAM
AND
ACCEPT ASSIGNMENT FOR ALL MEDICARE CLAIMS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

_____
Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I ACCEPT MEDICARE ASSIGNMENT ON A CASE-BY-CASE BASIS

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

This sign was prepared by the Medical and Chirurgical Faculty of Maryland (The Maryland Medical Society) in accordance with Section 14-705(b) of the Health Occupations Article of the Annotated Code of Maryland.

For My Patients

I DO NOT ACCEPT MEDICARE ASSIGNMENT IN ANY CASE

If you have any questions about my fees, please feel free to discuss them with me. As your physician, I am interested in your total health care.

Physician's Signature

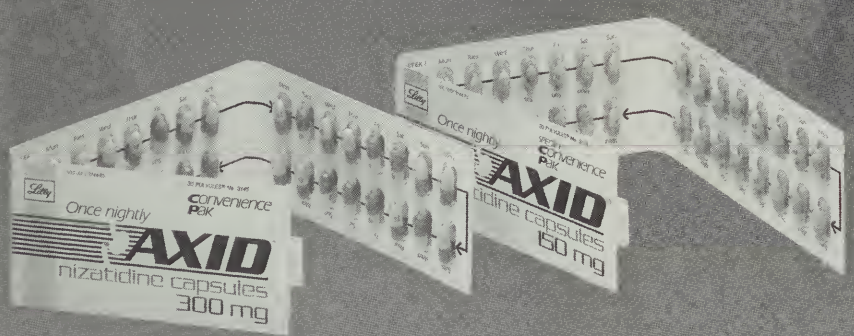
AXID®

nizatidine

Enhances compliance and convenience

Patients appreciate Axid, 300 mg, in the Convenience Pak

In a Convenience Pak survey (N = 100)[1]



- 100% said the directions on the Convenience Pak were clear and easy to understand
- 93% reported not missing any doses

Pharmacists save time – at no extra cost

- The Convenience Pak saves dispensing time and minimizes handling

The Convenience Pak promotes patient counseling

- Pharmacists dispensing the Axid Convenience Pak can encourage compliance and continued customer satisfaction

Convenience Pak is available at no extra cost

NZ-2907-B-949310 © 1989, ELI LILLY AND COMPANY

AXID®

nizatidine capsules

Brief Summary

Consult the package literature for complete information.

Indications and Usage: Axid is indicated for up to eight weeks for the treatment of active duodenal ulcer. In most patients, the ulcer will heal within four weeks.

Axid is indicated for maintenance therapy for duodenal ulcer patients at a reduced dosage of 150 mg h.s. after healing of an active duodenal ulcer. The consequences of continuous therapy with Axid for longer than one year are not known.

Contraindication: Axid is contraindicated in patients with known hypersensitivity to the drug and should be used with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General* — 1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Because nizatidine is excreted primarily by the kidney, dosage should be reduced in patients with moderate to severe renal insufficiency.

3. Pharmacokinetic studies in patients with hepatorenal syndrome have not been done. Part of the dose of nizatidine is metabolized in the liver. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests — False-positive tests for urobilinogen with Multistix® may occur during therapy with nizatidine.

Drug Interactions — No interactions have been observed between Axid and theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450-linked drug-metabolizing enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increases in serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility — A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice; although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy — Teratogenic Effects — Pregnancy Category C — Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus and at 50 mg/kg it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers — Studies conducted in lactating women have shown that <0.1% of the administered oral dose of nizatidine is secreted in human milk in proportion to plasma concentrations. Caution should be exercised when administering nizatidine to a nursing mother.

Pediatric Use — Safety and effectiveness in children have not been established.

Use in Elderly Patients — Ulcer healing rates in elderly patients are similar to those in younger age groups. The incidence rates of adverse events and laboratory test abnormalities are also similar to those seen in other age groups. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of nizatidine included almost 5,000 patients given nizatidine in studies of varying durations. Domestic placebo-controlled trials included over 1,900 patients given nizatidine and over 1,300 given placebo. Among reported adverse events in the domestic placebo-controlled trials, sweating (1% vs 0.2%), urticaria (0.5% vs < 0.01%), and somnolence (2.4% vs 1.3%) were significantly more common in the nizatidine group. A variety of less common events was also reported; it was not possible to determine whether these were caused by nizatidine.

Hepatic — Hepatocellular injury, evidenced by elevated liver enzyme tests (SGOT [AST], SGPT [ALT], or alkaline phosphatase), occurred in some patients and was possibly or probably related to nizatidine. In some cases, there was marked elevation of SGOT, SGPT enzymes (greater than 500 IU/L) and, in a single instance, SGPT was greater than 2,000 IU/L. The overall rate of occurrences of elevated liver enzymes and elevations to three times the upper limit of normal, however, did not significantly differ from the rate of liver enzyme abnormalities in placebo-treated patients. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular — In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS — Rare cases of reversible mental contusion have been reported.

Endocrine — Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to Axid. Impotence and decreased libido were reported with equal frequency by patients who received Axid and by those given placebo. Rare reports of gynecomastia occurred.

Hematologic — Fatal thrombocytopenia was reported in a patient who was treated with Axid and another H_2-receptor antagonist. On previous occasions, this patient had experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental — Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity — As with other H_2-receptor antagonists, rare cases of anaphylaxis following administration of nizatidine have been reported. Because cross-sensitivity in this class of compounds has been observed, H_2-receptor antagonists should not be administered to individuals with a history of previous hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other — Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine administration have been reported.

Overdosage: Overdoses of Axid have been reported rarely. The following is provided to serve as a guide should such an overdose be encountered.

Signs and Symptoms — There is little clinical experience with overdosage of Axid in humans. Test animals that received large doses of nizatidine have exhibited cholinergic-type effects, including lacrimation, salivation, emesis, miosis, and diarrhea. Single oral doses of 800 mg/kg in dogs and of 1,200 mg/kg in monkeys were not lethal. Intravenous median lethal doses in the rat and mouse were 301 mg/kg and 232 mg/kg respectively.

Treatment — To obtain up-to-date information about the treatment of overdose, a good resource is your certified regional Poison Control Center. Telephone numbers of certified poison control centers are listed in the *Physicians' Desk Reference (PDR)*. In managing overdosage, consider the possibility of multiple drug overdoses, interaction among drugs, and unusual drug kinetics in your patient.

If overdosage occurs, use of activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance.

Additional information available to the profession on request.

Pro Update

Maryland's PRO is the Delmarva Foundation for Medical Care, Inc. (DFMC). Many physicians have expressed concerns regarding PRO actions and communication problems. To help Maryland physicians better understand the federally regulated PRO requirements and how the review-denial-appeals process works, the Maryland Medical Journal, *in cooperation with Delmarva, publishes PRO Update in an attempt to define and clarify these issues, often by using case examples to illustrate general topics. We welcome readers' comments regarding the impact of these regulations on the quality of care delivered to patients.*

JOHN A. SINGER MD, Chairman
Medical and Chirurgical Faculty
Peer Review Organization Monitoring Committee

In the last month's PRO Update, general background information on Maryland's Peer Review Organization (PRO) was presented. Specific aspects of the review process will be illustrated in this and subsequent issues.

Case Example: Utilization Review with Denial

There are two main categories of review findings: Quality Assurance and Utilization Review. Each case selected for review undergoes a full-menu review, covering both quality and utilization issues. We present a case that demonstrates an instance in which there was a utilization problem but no identified quality concern or problem found. (There are cases when one review may result in both a utilization denial and a quality problem determination.) In the next issue we will present a case illustrating a problem with the quality of care.

Clinical Course Mr. Doe is a 66-year-old, WDWN white male with coronary atherosclerosis, hyperplasia of the prostate, and uncomplicated diabetes, adult onset. He had a history of unstable angina and an acute MI, and cardiac catherization had revealed severe, multivessel occlusive disease with a 42% ejection fraction. He was admitted to a hospital for coronary artery bypass graft on 05/05/88.

The patient underwent surgery on 05/06/88 and for the next nine days required multiple acute services, including maintenance of heart rate by pacer for several days.

On 05/13/88, Mr. Doe was transferred from CCU to the floor. His incision was healing well, and pulmonary and cardiac functions were stable. However, his hematuria continued. On 05/15/88 it was noted that the patient "ambulates OK" and that the urologist was going to cystoscope patient due to hematuria. It was also noted that Mr. Doe had stable BP with recurrent PVCs and that ambulation was being encouraged.

The cystoscopic report on 05/15/88 stated "No evidence of urethral injury; enlarged prostate and prostatic urethra." On 05/16/88, Mr. Doe's vital signs were stable, he was continent, ambulating bed to chair and bathroom, and his suture line was dry and intact. It was noted that he would be followed up in the office. On 05/17/88 patient's vital signs were stable, he was afebrile, without complaint, and doing well. On 05/18/88 he was discharged to home with his wife and daughter. He was ambulating by himself, and arrangements were made with the Visiting Nurses Association for follow up regarding medications, monitoring, and diet instruction.

The Review Process On 07/17/88, the hospital submitted a complete bill for Mr. Doe's care to the Fiscal Intermediary (FI) processing the Medicare claims for this hospital. A week later, the information about the paid claim was forwarded to the PRO's data processor.

On 07/25/88, Mr. Doe's hospitalization was identified for retrospective review by the PRO's random selection process. The PRO notified the hospital's medical records department; the chart was sent for PRO review. On 08/16/88, the PRO nurse reviewer examined the complete medical record. She identified no potential quality issues but did question the medical necessity of hospitalization 05/16/88 and 05/17/88, noting that no acute services were rendered on those days. Therefore, she referred this case to a physician advisor.

The physician advisor reviewed the case on 08/24/88. His feeling was that the patient was stable enough for discharge on 05/16/88 and that payment for 05/16/88 and 05/17/88 should be denied. (Under Medicare, payment is never made for day of discharge.)

The patient's attending physician was notified of the potential denial on 08/26/88 and given until 09/13/88 to provide any additional information that would justify the last two days of the patient's hospital stay. No additional information was provided by the attending. The PA approved a formal denial letter, which was sent on 09/19/88 to the patient with copies to the attending physician, the hospital PRO liaison, and the fiscal intermediary, denying payment for two days.

The chairman of the hospital's Utilization Review Committee notified the PRO on 10/31/88 of a disagreement with the PRO's decision and a request for reconsideration of the denial. The hospital submitted the following information for the days in question:

> 05/16/88 - preparing for discharge
> 05/17/88 - patient very slow to ambulate and to understand instructions

On 11/07/88, the PRO forwarded a copy of the

patient's medical record, its worksheets, and a letter from the UR Chairman of the hospital to a cardiologist for review (reconsideration). On 11/14/88, the reviewing cardiologist (a physician advisor) reported that he would deny only 05/17/88, as in his opinion 05/16/88 was necessary to stabilize the patient. On 11/17/88, a reconsideration notice was issued that partially overturned the initial denial by now approving 05/16/88 for payment.

Mr. Doe received copies of both the original denial and the reconsideration notices as required by Medicare regulations. He was confused by both letters and called the PRO's toll-free number (1-800-492-5811). He spoke to the Outreach Counselor who assured him that the letter meant that the hospital would not be paid for the day in question; however, Mr. Doe did not have to pay anything to Medicare or to the hospital.

1988 Continued Stay Denials

Quarterly data generated by the DFMC indicate that 7.5 percent of reviews completed in 1988 resulted in a continued stay denial with 2.7 percent of reviewed days denied. A *continued stay denial* is one in which only part (one or more days) of an inpatient stay is denied as opposed to an admission denial, which involves a denial of the entire stay.

A summarization of 1988 data on continued stay denials shows that from a total of 53,932 reviews, 623,098 days were reviewed; 4,049 cases (7.50 percent) were denied (cases in which one or more days of admission were denied); and 16,911 days (2.71 percent) were denied. Data were adjusted to reflect overturned/modified denials that occured as a result of the reconsideration process. (In future issues data related to admission denials will be presented.)

Glossary

Continued stay denial - is one where only part of an inpatient stay is denied, as opposed to an admission denial, which involves a denial of the entire stay.

Denial (adverse determination) - Physician or review committee decision that the hospital admission, continued stay, provided services, or procedures performed were medically unnecessary or inappropriate. Denial decisions may or may not affect payment to the hospital depending on waiver status. Only in rare instances does a denial affect charges to the patient or payments to the physician.

Discharge review - A review of the patient's condition and the services he requires during the last 48 hours of hospitalization. This review is to assure that patients are not discharged prematurely.

Fiscal intermediary (FI) - A claims payment agency, typically an insurance company such as Blue Cross/Blue Shield, that contracts with Medicare to provide beneficiary billings.

Nurse reviewer (review coordinator) - An RN with a current Maryland license. Nurse reviewers generally have hospital floor experience as well as Utilization Review (UR) or Quality Assurance (QA) background.

Peer Review Organization (PRO) - Established September 3, 1982, by Public Law 97-248, as part of the Tax Equity and Fiscal Responsibility Act (TEFRA), an entity that either is composed of a substantial number of licensed doctors of medicine or osteopathy practicing in the area or has available to it physicians to perform review of medical services. PROs are organizations under contract with HCFA to provide utilization and quality review of services provided to Medicare beneficiaries.

Physician advisor (PA) - All PAs must be licensed and actively practicing in the State of Maryland. Any PA reviewing a request for reconsideration must be a specialist in the same field as the attending physician. Both board certified and board eligible specialists qualify for review of reconsiderations.

Quality assurance - A process focusing on the quality of care provided under Medicare. This process includes the application of generic quality screens for the purpose of referral to a physician advisor.

Random selection - One review selection mechanism used by each PRO for acute facilities is the random sample, a selection of 3 percent of paid claims, stratified by facility. Selection is by facility so that 3 percent of each facility's claims are selected.

Reconsideration - All parties of an adverse determination are offered an opportunity for reconsideration. Reconsideration must be requested within 60 days of the notification of the adverse determination.

Retrospective review - Review of the medical record after the patient has been discharged. This generally occurs after the hospital bill has been paid by the fiscal intermediary, and the PRO's data processor has been notified that the claim has been paid.

Utilization Review - A process focusing on the necessity of admission and length of stay.

Next in PRO Update . . .

- Case Example of a Confirmed Quality Problem
- Example of a Generic Screen Failure

PRO Update is contributed by the Publications Committee of the Delmarva Foundation for Medical Care, Inc. (Donald Harting MD, MPH, Chairman; Carol Lewis MPH, ScD; Jan Melhunek MHS) in cooperation with the Med-Chi Peer Review Organization (PRO) Monitoring Committee, John Singer MD, Chairman. ■

ICD-9

Use this special order form to order **ICD-9-CM, Third Edition, Vols. 1 & 2** and get:

- the clothbound official U.S. Government third edition
- assured receipt of all addenda to be issued through 1991 *(addenda will **not** be sold seperately)*
- shipment by priority mail

(Please use this special order form and address only for ICD-9-CM, Third Edition, Vols. 1 & 2.)

Order Form

☐ **YES** Please enter my order for ____ copies of **ICD-9-CM, Third Edition, Vols. 1 & 2** at $43 domestic ($53.75 foreign). I understand that it will be shipped by priority mail and that I will automatically receive all addenda issued through 1991 at no additional cost.

Highlights: Executive Committee and Council Actions

Executive Committee - March 16, 1989

Minutes The Executive Committee approved the following minutes as distributed:

Executive Committee Conference Call, February 8, 1989

Executive Committee Meeting, February 16, 1989

House of Delegates Special Session, November 19, 1989

PRO Monitoring Committee Dr. John A. Singer, Chairman of the PRO Committee, presented a summary of the third scope of work involving the designated PRO, the Delmarva Foundation for Medical Care. Of particular concern was the proposed outpatient procedure list and the preadmission/pre-procedure review requirements. Following discussion of the issue, the Executive Committee authorized release of comments developed by the PRO Monitoring Committee objecting to proposed HCFA regulations that would (1) deny Medicare payment for inpatient hospital services that do not meet professionally recognized standards of care and (2) allow written complaints from beneficiaries regarding quality of care.

Blue Cross/Blue Shield of Maryland Notification has been received from Blue Cross/Blue Shield of Maryland that effective April 1, 1989, physicians profiles will be increased by a total of $13.8 million annually and that the base charge period for this increase is the calendar year 1988. Following discussion, the Executive Committee directed that staff seek further clarification as to the extent that the increase incorporates the principles proposed in the Harvard University Resource Based Relative Value Study.

Physician Quality Assurance Board (PQAB)

Conflict of Interest The Executive Committee received for information a letter from the PQAB to the State Ethics Commission asking whether Board members may (1) serve as expert medical witnesses in malpractice or other cases involving medical issues or (2) engage in lobbying activities as to medical issues. This letter did not request and, therefore, the Ethics Commission did not respond specifically to whether a Board member may be an officer in a medical society or a member of the Board of Directors of the medical society. It was suggested that Med Chi notify any appointee to the PQAB of the proper completion of the disclosure form. This form is enclosed with the letter of appointment from the Governor's office.

Fee Complaints It was reported that the PQAB had agreed to send fee complaints to Med Chi for a one year trial period and that criteria for fee reviews is in the process of being developed by the PQAB counsel. Dr. Atkins suggested that it should be made clear to the Faculty membership (perhaps through the *Maryland Medical Journal*) that the Board has decided to send some fee complaints to the Health Advocacy Unit of the State Consumer's Protection Division for purposes of mediation.

AMA Delegate/Alternate Delegate The Executive Committee was informed that one additional AMA delegate and alternate delegate has been allocated to Med Chi and that nominees for these positions would be considered at the 1989 annual meeting of the House of Delegates. Discussion of a request by Dr. John Hebb for an outside parliamentarian to review the seating of the alternate delegates resulted in a motion that staff be directed to seek an unbiased opinion from an experienced parliamentarian. Dr. Bob made a motion, and it was agreed unanimously, that the former parliamentarian of the Maryland Senate, Alan Rifkin, Esq., be the parliamentarian, and that he be requested to review the matter presented by Dr. Hebb.

Mutual Fire Inland and Marine Malpractice Insurance The Executive Committee was informed that Mutual Fire is no longer approved to do business in Maryland because of its insolvency. Since Mutual Fire is a surplus line insurer, it is not covered by the Maryland Property and Casualty Insurance Guaranty Corporation. Following discussion the Executive Committee directed that the component societies be notified of the status of Mutual Fire and that *MMJ* be used to notify the entire membership of the company's insolvency. Staff was also directed to obtain a list of Maryland physicians insured by Mutual Fire.

Governor's Commission on Health Care Costs Following a presentation by Dr. Peter Dans, Chairman, Small Area Practice Variations Committee, the Executive Committee authorized Dr. Dans to brief the Committee on Health Care Costs of the Governor's Commission on Health Care Policy and Financing on the activities of his committee, the effectiveness of practice patterns analysis, and the development of clinical practice standards and protocols as cost containment strategies.

Public Relations Committee

Award for Medical Student Dr. William Cassidy, Chairman, Public Relations Committee, on behalf of the Committee, recommended that an award, in the form of a plaque, be established to recognize the contributions of Maryland medical students to organized medicine. The criteria for qualified nominees would require that the student nominee be a member of Med Chi, chosen by the deans of the three medical schools in Maryland, and with the approval of the President of Med Chi. The President of the student component society would arrange for the award and a representative of Med Chi to be present at each school's graduation ceremony for presentation of the award. The Executive Committee endorsed the recommendation as presented.

Proposed Med Chi Logo Dr. Cassidy presented the proposed logo for Med Chi and explained that the proposed change in the Med Chi was for simplification

to be used on stationery, etc.; however, that the present Med Chi seal would be retained as the official seal. Dr. Nagel suggested that the address and phone number of Med Chi's Annapolis office be included on the stationery. This matter will be forwarded to Council for action.

FAX Project The Executive Committee adopted a motion to endorse the development of a Med Chi FAX network, to recommend to the Council that the Faculty purchase 7 FAX machines for the use of the Executive Committee at a cost of about $9,000, and that the Council authorize the Faculty to make 3-year loans with appropriate interests to any of the component societies that may require such assistance to purchase a FAX machine of their choice in order to participate in the network.

Monthly Financial Report The Executive Committee accepted the monthly financial reports for January and February 1989. A motion by Dr. Bob was adopted by the Executive Committee that the 1989 budget be revised to include costs associated with travel expenses for the additional AMA Delegate and Alternate Delegate (recently allocated by the AMA) for attendance at the 1989 AMA Annual Meeting in Chicago and the Interim Meeting in Hawaii; also, to increase the budget based on Council's approval of the FAX project.

Medical Assistance Program - Prescriptions for Brand Name Drugs Effective March 15, 1989, new regulations of the Maryland Medical Assistance Program will require physicians to write on prescriptions "Brand Medically Necessary" with an explanation as to why a generic equivalent is not medically appropriate. The Executive Committee, after discussion, adopted a motion by Dr. Bob that the draft letter to Adele Wilzack be endorsed and that Gerry Evans carry the message to the legislature that such a regulation is against the community's standard of care.

Committee on AIDS The Executive Committee voted to table the request of the Committee on AIDS for a $250 donation to an AIDS education program geared to educate inner city, middle school-aged children about the transmission of AIDS. The Executive Committee voted to table the issue until additional information can be obtained on the scope of the program and how it will be implemented and administered.

Maryland Medical Journal The Executive Committee voted to accept and forward to Council a mission statement and objectives of *MMJ* as submitted by the Editorial Board.

Committee on Scientific Activity Dr. Atkins reported on discussions within the Committee on Scientific Activity regarding proposed changes in the times and structures of the Med Chi Annual and Semiannual Meetings. The Executive Committee recommended that the Committee on Scientific Activity be encouraged to continue its discussions regarding a new format for the meetings, proceed with a three-day meeting for the year 1990, consider changing the meetings to a Thursday, Friday, and Saturday setting and explore the possibility of holding multiple one-day meetings around Maryland.

Mammography Screening Study The Executive Committee received as information a proposal of Blue Cross and Blue Shield of Maryland to conduct a mammography pilot study and educational program to examine the factors that determine women's access to and use of regular mammogram screenings. Blue Cross/Blue Shield will contribute $50,000 to the study, which will be conducted in conjunction with the American Cancer Society.

AIDS Survey The Executive Committee endorsed a survey of Maryland physicians to be conducted by the AIDS Administration of the DHMH in an effort to obtain information regarding their concerns and knowledge regarding AIDS and HIV-related problems. The results of the survey will be shared with Med Chi.

Legislative Report Gerry Evans provided an update on legislative activities.

Council - March 23, 1989

Minutes The minutes of the Council and Executive Committee were acted upon as follows:

Minutes approved: Council meeting of January 28, 1989

Special Council meeting of February 16, 1989

Minutes accepted: Executive Committee meeting, January 19, 1989

Executive Committee Conference Call, February 8, 1989

Executive Committee meeting, February 16, 1989

Peer Review Handbook Dr. Emidio Bianco, Chairman of the Peer Review Committee, addressed the Council and asked for Council endorsement of the final draft of the Peer Review Handbook. Drs. Nakazawa and Yosuico offered congratulations to Dr. Bianco and his committee as well as to all who were involved in producing the handbook to which the Council responded with a round of applause. The Council then voted to endorse the Peer Review Handbook as presented. A copy will be sent to the Board of Physician Quality Assurance Board for review and implementation into regulations.

Emeritus Membership The following members were approved for Emeritus Membership as requested by the component society indicated:

Anne Arundel County

Christine Kim MD, Annapolis
Clayton Norton MD, Severna Park

Baltimore City

Charles E. Ellicott MD, Baltimore
Edward L. Glassman MD, Baltimore
Edmund B. Middleton MD, Towson
Ernest Scher MD, Baltimore

Alan C. Woods, Jr., MD, Baltimore

Baltimore County

Leonard C. Akman MD, Baltimore

Frederick County

Gerald Schipper MD, Frederick

Montgomery County

William H. Ferguson MD, Rockville

James A. Roberts MD, Silver Spring

Prince George's County

Leroy E. Hoeck MD, Tantallon

Wicomico County

Raymond Collado MD,Pembroke Pines, FL

Affiliate

James H. Nelson MD, Escondido, CA

The above names will be presented to the House of Delegates on April 12, 1989 for approval.

Dues Waiver The Executive Committee approved the following physicians for 1989 dues waiver at the request of the component society indicated:

Baltimore City

Janet H. Greenhut MD, Baltimore

Richard A. Sindler MD, Towson

William Korman MD, Baltimore

Montgomery County

Howard N. Bernstein MD, Rockville

T. James Waters MD, Chevy Chase

St. Mary's County

G. Josephine Garner MD, Leonardtown

Committee on Scientific Activity Dr. Gary Rosenberg, Chairman of the Committee on Scientific Activity, stated that there was a need to look at new formats for the annual and semiannual meetings due to the unavailability of suitable sites in Maryland, and requested input from the Council members. He also reported that, at this time, a site for the 1990 annual meeting has not been selected, but there was a possibility that Turf Valley Hotel and Country Club could be used for the meeting, provided this year's meeting is successful. The Committee will continue to explore alternatives.

Monthly Financial Reports On motion of Dr. Yosuico, the Council accepted the financial reports for the months of January and February 1989 as presented.

Continuing Medical Education Review Committee Dr. Yosuico, Chairman of the Ad Hoc Committee appointed by the Council to study the question of remuneration to members of the CMER Committee for site surveys conducted by its members reported that it was the recommendation of the ad hoc committee that remuneration should not be provided to members of the CMER committee, based on the fact that no other committee of the Faculty received payment for their services. The Council adopted the recommendation of the ad hoc committee, and restated its position that members of this committee not be paid for services rendered.

Maryland Medical Journal The mission statement and objectives of the *Maryland Medical Journal* were adopted by the Council as Faculty policy. It was pointed out that this does not replace any other policies or mission of *MMJ*. The mission statement and objectives as approved are:

Mission Statement of the *Maryland Medical Journal*

The purpose of *MMJ* is to provide a forum for open and responsible discussion of matters relevant to the field of medicine; to educate and inform its readers of progress in other fields of interest to physicians; and to promote the science and art of medicine toward the betterment of public health.

Objectives of the *Maryland Medical Journal*

1. To publish definitive, peer-reviewed clinical and investigative reports that are representative of the major medical disciplines.
2. To provide physicians with continuing education in basic sciences and research in order to support informed clinical decisions.
3. To forecast important issues and trends in medicine.
4. To foster responsible debate on controversial issues that affect medicine.
5. To enable physicians to remain informed in every aspect of medicine, including developments in fields other than their own.
6. To inform readers about nonclinical aspects of medicine, including the political, philosophic, ethical, legal, social, economic, historical, and cultural.
7. To improve the public health worldwide by elevating the standards of medical care and disease prevention provided by an informed readership.
8. To achieve the highest level of medical journalism and to be enjoyable to read.
9. To inform readers of policies and actions of the Medical and Chirurgical Faculty, its Council, and House of Delegates as appropriate.
10. To encourage component medical societies to submit to the *Journal* items of local interest, including projects under consideration, programs for enhancing the image of medicine within their component societies, as well as changes in their leadership, officers, etc.

President's Regional Meetings Dr. Dobridge reported on the regional meetings held with the Western Maryland and Eastern Shore physicians and announced that a meeting was planned in southern Maryland, March 29, 1989, in Waldorf, Maryland.

AMA Delegate/Alternate Delegate It was reported to the Council that due to Med Chi's increased membership in the AMA, Maryland has been granted an additional delegate and alternate delegate to the AMA. This increases the Faculty's representation to the AMA to 7 Delegates and 7 Alternates. The Council was also informed that the Executive Committee at its meeting on March 16, 1989, in response to a inquiry from a member, authorized the staff to seek an outside parliamentary review of the action taken by Council on January 28 relative to filling vacancies within the AMA Delegation.

Mutual Fire Inland and Marine Malpractice Insurance The Council was informed that Mutual Fire had become insolvent and was no longer approved to do business in Maryland. The component and specialty societies have been notified and have been asked to canvass their membership to determine if any of their members are insured by Mutual Fire for medical liability and, if so, to advise them to contact Med Chi,

and Med Chi will keep them apprised of the reorganization plan of Mutual Fire.

Medicaid Diversion Plan Dr. Herman Maganzini, Co-Chairman of the Public Health Committee, presented the recommendations of the Liaison Committee with the Department of Health and Mental Hygiene concerning proposed regulations of the Medical Assistance Program to divert Medical Assistance beneficiaries from hospital emergency departments and hospital outpatient clinics. Following a lengthy discussion, the Council adopted a motion to approve Recommendations #1 as stated and Recommendation #5, as amended. The recommendations, as adopted, are as follows:

> Recommendation #1: That the Council reaffirm its position that fees for Medicaid visits be standardized for the private physician, emergency department, outpatient clinic, and hospital clinic, etc. All providers of professional medical care irrespective of the setting in which the medical care is provided, should be reimbursed at the same level so as to encourage the provision of primary care in the private office setting, thereby enhancing continuity of care.
> Recommendation #5: That Med Chi continue its support of Emergency Medicine physicians with respect to inherent professional liability in the Medicaid Diversion proposal and with regard to a conflict in the federal law about access to care and transfer of patients.

Council also adopted a motion by Dr. Lewers that it is the position of Med Chi and the Council (1) that we recognize the need for cost control within the Medicaid Program, not only in Maryland but in the entire country; and (2) that we oppose the Medicaid Diversion Program as currently established by the Department of Health and Mental Hygiene on the grounds of issues pointed out, and that we are willing to work with the Department in establishing a program, and that this program is premature.

Public Relations Committee Dr. William Cassidy, Chairman of the Public Relations Committee, presented the committee's proposal to change the title and logo of Med Chi. After review and discussion of the packet of stationery distributed, Council voted to approve items 1, 4, and 6 of the stationery packet distributed, with the following modifications:

(a) retain the traditional Med Chi seal to be placed to the left side of the stationery;

(b) change Maryland State Medical Association to Maryland State Medical Society shown on the bottom of the stationery.

Brand Name Prescriptions - Medical Assistance Program The Medical Assistance Program has been notified that effective March 15, 1989, new regulations will require physicians to write on the prescriptions of medical assistance recipients the words "Brand Medically Necessary" with an explanation as to why a generic equivalent is not medically appropriate. Following discussion, the Council approved a draft letter from Med Chi to the Secretary of Health and Mental Hygiene, urging withdrawal of this requirement.

FAX Project Council approved the purchase of 7 FAX machines for use by the Executive Committee at a cost of approximately $9,000, to be provided to the members on a loan basis. A second motion was adopted to provide FAX machines to those component medical societies having no access to a FAX, with the machines being purchased by Med Chi with an arrangement for payback by the component societies on a 3-year loan basis.

Maryland Physicians Care Program Council adopted the Maryland Physicians Care Program initiated by Dr. Antilitz. This program, modeled after the Kentucky care for the poor project, will be coordinated with the various organizations required to implement the program.

PRO Monitoring Committee Dr. John Singer, Chairman of the PRO Monitoring Committee, presented Council with a summary of the third scope of work involving the designated PRO, the Delmarva Foundation for Medical Care. It was the consensus of the Council that insufficient notice had been provided concerning the implementation of the preprocedure review requirements, which will have the potential to negatively affect the quality of care. The Council, after a lengthy discussion, adopted a motion to instruct the Faculty's legal counsel to look into implementing injunctive relief against Delmarva based on insufficient notice of implementation of the third scope of work, as well as the implementation on the potential impact of quality of care.

Legislative Update Drs. Leonard Lichtenfeld, Susan Guarnieri, Israel Weiner, co-chairpersons of the Legislative Committee, and Gerry Evans presented an update on legislative activities. ■

The History of Medicine Collection

is attempting to build our
medical artifact collection.
Currently we are seeking
hand-held surgical instruments, pre-1920
that were used by member Maryland physicians.

Volunteers

are sought to assist in sorting and processing
the Picture Collection and the Bookplate Collection.

MARYLAND GENERAL PROFESSIONAL CENTER

UPSCALE ENVIRONMENT. DOWNTOWN ACCESSIBILITY.

In response to the needs of medical professionals, we've built the Maryland General Professional Center. Reserved solely for the practice of medicine and related services, the center provides a professional atmosphere in a new, beautifully designed location for your practice.

• Central location is easily accessed by major traffic arteries from every direction, is served by the subway station at the State Office Complex, and is located adjacent to the planned light rail system stop at Howard and Madison.

• Conveniently located adjacent to Maryland General Hospital, within walking distance of hospitalized patients and specialized hospital services. Proximity improves coordination of care among patient, physicians and hospital.

• Reduced travel time between hospital and office for both physicians and patients.

• Features include a patient drop-off at the main entrance, 2 elevators (1 stretcher size), sound-conditioned walls, thermostatic controls for each suite, and handicap access.

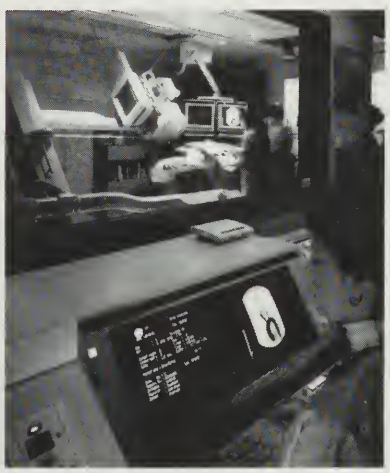
• Condominium arrangement offers office ownership benefits with low equity requirement.

• Ample parking available in the enclosed 317-space garage adjacent to the building.

• Located near Meyerhoff Symphony Hall, Lyric Opera House and Center Stage.

For more information, a brochure and a personal tour, call
ROBERT HAUSSMANN,
Vice President for Corporate Development, or
DANIEL BALDWIN,
Vice President for Planning at
(301) 225-8390.

Most of the hospital's semi-private rooms have been converted to private rooms with private baths.



Maryland General Hospital is a 213-bed acute care facility serving the Baltimore metropolitan community for 108 years. Maryland General offers a comprehensive range of patient care services. We pride ourselves in the excellent quality in patient care and support services. Qualified professionals are dedicated to assisting the patient and family members during treatment and recovery. We provide this clinical support through the staff and services of many departments.

MGH

Maryland General Hospital
827 Linden Avenue
Baltimore, MD 21201

Newly renovated nursing station on a medical-surgical floor.

The Special Procedures Laboratory, dedicated exclusively to angiography, was designed in response to the needs of physicians to obtain superior diagnostic data in a timely manner.

The computer is an electronic device that reads data (input), processes it (process), and reports information (output). It is used for a variety of tasks. Businesses use them for such jobs as word processing, accounting applications, inventory control, maintaining personnel information, and forecasting sales, costs, and profits. Scientists and engineers use computers for problem solving and simulations of experiments. Educators use computers as tutorial devices.

When talking about computers we can divide the discussion into two parts, hardware and software. The physical parts of a computer system are considered the hardware. In general, hardware includes the computer itself, the monitor, the modem, the printer and the graphics card. Instructions given to computer are called software. Instructions grouped together are referred to as a program. A program is a set of related instructions that process data and produce a specified result..

Hardware

The hardware for a computing system normally is composed of the following parts: input devices, a central processing unit, memory, auxiliary storage, and output devices.

Input - An input device is used to enter commands, instructions, and data into the computer. There are many types of input devices including a keyboard, mouse, digitizer, optical scanner, light pen, magnetic disk and tape, and sensor devices like the types used in security systems and computer-controlled heating systems.

Central Processing - The central processing unit (CPU) functions as the brains of the computer. The processing of all instructions occurs in the CPU. The CPU consists of a control unit and an arithmetic and logic unit. The control unit carries out instructions to route data and instructions to and from memory and to and from auxiliary storage. The control unit also accepts instructions, commands, and/or data from the input device and sends information to the output device.

The arithmetic and logic unit (ALU) does arithmetic calculations and compares values. The comparison of values is done by logical operations, which include the mathematical relationships of less than, greater than, and equality.

Memory - The memory of a computer is referred to as main memory, primary storage, or random access memory (RAM). Instructions and data are stored in RAM before they are processed. RAM is measured by the number of characters that can be stored in the memory of the computer. Each letter, digit, or symbol on the keyboard takes up one byte in memory. One byte is a set of 8 bits that represent a decimal number in binary code. Binary code is the decimal value for keyboard characters represented in the base two number system. Each bit (binary digit) is a binary 0 or 1. When you press a key on the keyboard an 8-bit code representing the key pressed is sent from the keyboard to the CPU.

A kilobyte is 1024 bytes or 1K. In order to simplify calculations, 1K is usually approximated as 1000 bytes. The size of the IBM personal computer system memory ranges from 512K bytes to four megabytes (4M or approximately 4,000,000 bytes) or more. RAM chips is the term given to the memory chips that make up main memory. Each chip normally holds eith 64K or 256K bytes.

Another type of computer memory is Read Only Memory (ROM). ROM contains information permanently stored on the ROM chips. ROM is supplied by the computer manufacturer and cannot be changed by the user. This type of memory is nonvolatile, that is, it retains the information when the power is cut off. ROM is considered hardware, but the *instructions* in ROM are considered software.

Auxiliary Storage - Since it is not possible to keep all the software and data that one might ever use in RAM, more permanent storage is necessary. Secondary storage or auxiliary storage is nonvolatile. Without nonvolatile secondary storage, you would have to reenter the instructions and data each time you restarted your computer, a very arduous task! Since power supplies are not always dependable, wise users frequently copy to secondary storage whatever they are inputting into the computer. This precaution prevents them from having to reenter the entire set of information again.

- Magnetic floppy disks are a very popular form of auxiliary storage. The two most common sizes of floppy disks are the 5 ¼" and 3 ½".
- Another popular form of auxiliary storage is the hard disk or fixed disk. A hard disk is usually divided into subdirectories with each different application placed in its own subdirectory.
- Magnetic tape can also be used for auxiliary storage. It is very popular as a backup device for hard disk systems.

Since 5 ¼" floppies can be damaged very easily, they should be handled with care. The disks should be kept away from magnetic fields, heat, cold, dust, and moisture. Disks should be stored in a vertical position so that there is no pressure exerted on them and users should take care not to touch the exposed magnetic surface. Copies (backups) of important disks should be made so the information on them will not be lost.

Output - The purpose of using a computer is to produce some type of output for the user. The information produced by the computer must be sent by the CPU to some type of output device. The most common forms of output devices are the display screen or monitor and the printer. Output that is sent to the

printer is referred to as hard copy while output sent to the screen is called soft copy.

Software

The instructions that cause the hardware parts to work together to produce some result are referred to as software. The two categories of software are the *system software* and *applications software*. System software includes the Disk Operating System (DOS), compilers, interpreters, and utilities. Application software includes programs such as accounting packages, data base programs, and word processing programs.

The DOS is a collection of programs to manage the operation of the computer. Both the DOS and the hardware are mandatory for operation of your computer systems. You cannot use one without the other. Different computers may use different operating systems.

When the computer is turned on some instructions from DOS are loaded into RAM. These instructions allow the computer to function. They include directions for keeping track of all the programs and data that are available in the auxiliary storage and many utility programs, such as disk formatting programs and disk checking programs.

To get a better idea of how hardware and software interact, look at the following example. Suppose you are operating the computer in a business and your supervisor asks you to find the current status of an order. You and the computer would preform the following.

Step 1. Using the keyboard (input), you would give the command to load the appropriate program into RAM and execute it.

Step 2. Instructions from DOS would direct the computer to locate the program in auxiliary storage, move it into main memory, and then the CPU would start to execute the program instructions (processing).

Step 3. The CPU, with help from DOS, would send a message (one of the instructions) to the screen (output) asking for the order number.

Step 4. You would enter the order number (input).

Step 5. The CPU, again with help from DOS, would locate the order information from auxiliary storage and transfer it to memory (processing).

Step 6. Once the information is found, the CPU and DOS transfer the order information to the screen (output).

Programming Languages

Programming languages are system software. Many different languages have been designed to solve different programming applications. The programmer should choose the language that best fits the application.

High level languages are those languages that are not machine dependent. Programs written in high level languages can sometimes be transported from one type of computer to another with little or no modification. Their statements are Englishlike in form. Some of the higher level programming languages and their applications are as follows.

Business	COBOL, RPG
Science, Mathematics & Engineering	FORTRAN
Artificial Intelligence	LISP, PROLOG
General purpose	BASIC, C, PASCAL, CLIPPER

The set of instructions that make up a program are called code. When instructions are written in a high level language they are referred to as source code. Source code is close enough to human language to be easy for a programmer to read and understand. Because the CPU can only understand machine language or object code, a translator program must be run to translate source code into object code. Object code or machine language is the lowest level language. It is machine dependent, which means that different computers usually have different machine language code. Assembly language is also machine dependent, although it is a step above machine language.

Interpreters - An interpreter executes one instruction of a program at a time. Each time an instruction is executed, the system converts the source code into machine language instructions, called object code, so that the computer can perform the necessary tasks. This process can be an extremely redundant one; programs that are executed many times must be translated to machine language each time.

Compilers - A compiler first translates the entire program to machine language. If any errors are encountered, a complete listing of each error and the incorrect statement is given to the programmer. The errors are corrected and the program compiled over again. When no errors are detected, the compiled code can be executed. The machine language version can then be saved separately so that compiling need not be done again unless the original program is changed. Compiled programs run much faster than interpreted ones.

Summary

A **computer** is an electronic device that reads and processes data and then writes information.

A **computer system** is composed of both hardware and software.

Hardware includes input devices, the CPU, main memory, auxiliary storage, and output devices.

1. Input devices include the keyboard, mouse, digitizer, optical scanners, light pens, and sensor devices.
2. The CPU is composed of the control unit and the ALU.
3. Main memory is made of RAM and ROM. RAM is volatile, ROM is nonvolatile.

4. Magnetic disks and tape are forms of auxiliary storage. Auxiliary storage is nonvolatile.
5. Output devices include the screen, printer, plotter, magnetic disk and tape, and voice.

Hard copy is output sent to the printer; **soft copy** is output sent to the screen.

Software refers to system software and applications software.

System software contains DOS, programming languages, and utilities.

DOS is a system supervisor or manager.

Programs are sets of related instructions. Programs can be written in high level or low level languages.

High level languages are not machine dependent. The code of a high level language is referred to as source code.

Machine language is a low level language and is machine dependent. The code of low level languages is called object code. Object code is also called machine language.

Interpreters and **compilers** are two types of translator programs.

Translator programs convert source code into object code.

Compilers translate the entire source code into object code and then executes the machine language instructions.

Interpreters translate one source statement into machine language and then executes that instruction before going on to the next.

LEGAL AND ETHICAL CONCERNS OF YOUR MEDICAL PRACTICE

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIV, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and policies Governing the Practice of Medicine in Maryland.

■ ■ ■

The following revised policy opinions of the Faculty were adopted by the Council at the Annual Meeting on April 12, 1989:

Revised Policy Opinions

Discrimination

(a) In this section, discrimination means unfair prejudgment due to group identification or affiliation including, but not limited to, discrimination based on race, color, religion, creed, ethnic origin, or sexual orientation.

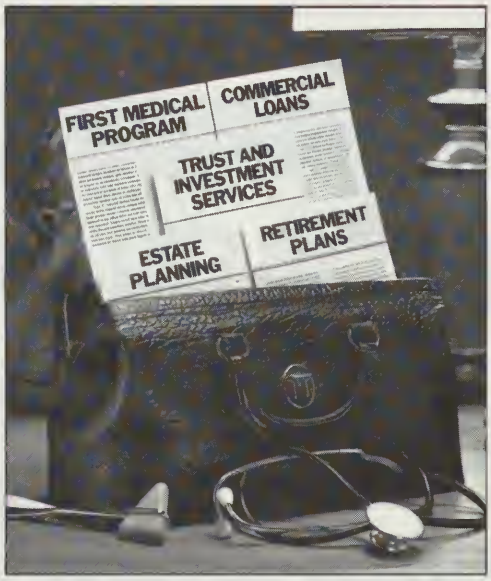
(b) The Faculty endorses Principle 6 of the AMA's Principles of Medical Ethics, which provides: A physician shall, in the provision of appropriate patient care, except in emergencies, be free to choose whom to serve, with whom to associate, and the environment in which to provide medical services.

(c) However, the Faculty deplores discrimination particularly within medical societies, component societies, and medical staffs.

(d) The Faculty also strongly deplores the selection of patients solely upon the basis of the patient's ability to pay. Examples of this category of patients are Medicare and Medicaid patients.

Return to Work Statement

(a) Return to work statements may contain the diagnosis determined by the physician. It is suggested that physicians not indicate such diagnoses unless permission has been given by the patient.



(b) Return to work statements that are prepared by a physician can be, on occasion, signed by the physician's secretary or nurse on behalf of the physician provided that permission has been given by the physician to his/her employee to do so for a particular patient or occurrence.

(c) Frequently, physicians complete absence-from-work statements in advance of the date the patient should return to work. Such a statement should contain the date of issuance and a specified date by which full recovery is anticipated. ■

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Advances in Surgical Management of Testicular Cancer

Testicular cancer serves as a model for laboratory, clinical and surgical investigations as well as a unique model for embryogenesis and oncogenesis. The recent advances in the understanding of its natural history, availability of tumor markers, newer regimen of chemotherapy, and meticulous regional lymphadenectomy have rendered stage I and II nonseminomatous testicular cancer a curable disease.

The conventional retroperitoneal lymphadenectomy has produced a high incidence of dry ejaculation with consequent infertility in patients undergoing this operation. Since testicular cancer mostly occurs in young men at the prime of their lives, fertility and fathering is usually an important consideration.

The newer technique of retroperitioneal lymphadenectomy is based on preserving the sympathetic trunks responsible for innveration of the ejaculatory mechanism. It has also proved to be adequate cancer surgery with rewarding survival in stage I, II, and in postchemotherapy period when there is persistent residual tumor. The technique we have developed is a modification of the conventional retroperitoneal lymphadenectomy.[1] Through a midline incision, retroperitoneal lymph nodes and the great vessels are exposed. A Knocker maneuver of the duodenum exposes the right renal pedicle. After ligation of the inferior mesenteric vein and the left spermatic veins, the left renal pedicle is also exposed. The inferior vena cava (IVC) and the aorta are exposed by excising the posterior peritoneum from the of Treitz to the ileocecal area. Dissection begins at the level of the renal pedicles over the IVC. The lymphatics surrounding these vessels are gently dissected without injury to the sympathetic trunks (Figure). The area of dissection should encompass the caval, aortal aortocaval, and the left renal pedicle lymph nodes. The left sympathetic trunk along the aorta is preserved. The branches of the sympathetic trunks below the major vessels also are preserved. The ipsilateral spermatic vein is removed. This dissection should start from the origin of the vein to the ipsilateral inguinal caval including the stump of the vein from the previous inquinal orchiectomy.

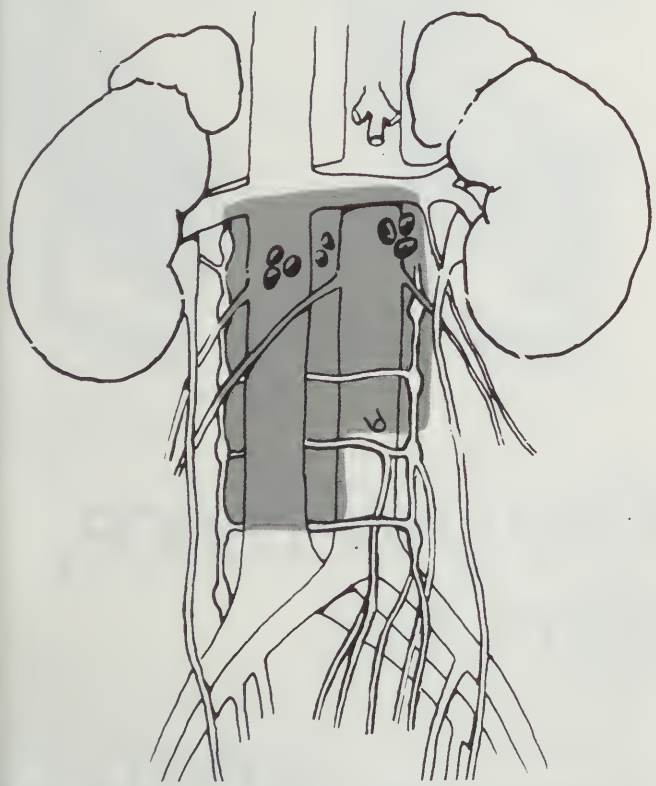

Figure. Demonstrates the extent of dissection and preservation of both sympathetic trunks and their branches.

Follow-up of these patients includes monthly physical examination, chest x-ray, determination of serum alphafetoprotein and human chorionic gonadotropin the first year, every three months into the second year, and once each year thereafter.

In the past several years, we have performed this procedure in 52 patients with low-stage nonseminomatous testicular cancer (NSTC) with only 2 initial failures.

Currently, we believe that a nerve-sparing retroperitoneal lymphadenectomy has therapeutic and prognostic value and will guide the clinician in assessing a need for further treatment.

Future efforts should focus on finding more sensitive, specific, noninvasive means to reach the accuracy of pathology staging.

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

Pharmaceutical Perspectives

Drug Safety Monitoring

Marjorie C. Allan MD, MPH

Dr. Allan is Senior Research Physician, Glaxo Inc.

Every ethical pharmaceutical manufacturer maintains a record of the adverse medical events reported in association with the use of their products. This data includes the worldwide experience during product development as well as after the product is marketed and for as long as the product is on the market. This unique body of information forms the basis for the response to your inquiries about a specific clinical problem.

Drug development is a lengthy process. Five to ten years may elapse between the time a drug is first tested in humans, is proved to be sage and efficacious, and finally is approved by the Food and Drug Administration. Many products are marketed in Europe or Asia prior to United States approval. Information from this experience is regularly collected by the manufacturer and included in the application for drug licensing.

The requirements for US licensing are based on monitored, randomized, double-blind clinical trials using carefully selected patients. This involves only 1,000 to 2,000 persons. The common adverse events are usually detected under these conditions. These are described in the product information under the Adverse Events section and occasionally in the Warnings or Precautions sections.

The product information is printed in the Physician's Desk Reference, at the expense of the manufacturer. Product information for the professional is included in every container of the product. Finally, a brief version is printed with every advertisement for the product. Although abbreviated, these summaries contain all the adverse event information.

When the product is marketed, the prescribing practices and patient usage are no longer carefully controlled. The number of users is greatly increased. At this time, the events that occur rarely, for example, 1/10,000 will be detected.

The detection of rare and serious adverse events requires the cooperation of the practicing physician and the pharmaceutical industry. This is particularly true as sophisticated products are developed for complex medical conditions. Complete information, hospital records, and pathology specimens may be required.

Even then, a single report may not be conclusive. A series of such reports, however, will cause the manufacturer to alert the medical professional through a product labeling change. This labeling change should be announced by a letter from the manufacturer or by the sales representative.

At any point between the detection of the first report of a new adverse event and notification of the medical community, the manufacturer maintains the case reports in the corporate records. These records include international reports, any report that may be a part of the spectrum of the new condition, and any serious reports known with the specific product. Every report is entered and subsequently reported to the Food and Drug Administration regardless of how sparse that data may be or how trivial the event. Reports with complete data are more helpful. Each FDA submission retains the words of the reporter without interpretation.
